Ninth.—That recognizing the influence which the production of the precious metals has upon the general welfare of the Nation, in increasing its taxable property and consequently its revenue, we respectfully solicit Congress to give liberal aid to the work, in such manner as in their wisdom they may deem proper.

Tenth.—That we fully recognize the foresight of A. Sutro, Esq., in projecting this great work, and highly appreciate the intelligent manner in which he has presented to the public the importance and necessity of this enterprise.

All of which is respectfully submitted.

WM. J. LEWIS,  
ARCH'D COOPER,  
P. M. RANDALL.

**THE SKULLING BLADE APPLIED TO STEAM-BOAT PROPULSION.**—Mr. William Sublett, of this city, has invented and taken the preliminary steps to secure a patent for a rotary application of the skulling blade to the propulsion of steamboats. The device is similar in its application to the propeller; but the blades, instead of working on the principle of the screw, approach fully to that of the skull. He has been engaged for several years in perfecting the idea, and has now completed a working model, which is operated by clock-work, and which appears to work very efficiently. The model has three wheels or propellers—one at the stern, and one upon each side, operated very much like ordinary paddle-wheels; but avoiding the jar and dead-water lift of the paddles. The model, which weighs only one pound, will start a load, in the form of a harge weighing 200 pounds, and move it six feet in ten seconds.

**NEW INCORPORATIONS.**—The following companies have filed their certificates of incorporation since our last issue:

April 20th.—Robertson Track-Laying Machine Co. Capital stock, \$500,000, in 500 shares. Trustees: C. Temple Emmett, Alpheus Bull, Wm. H. L. Barnes, Ephraim W. Leonard, Charles E. McLane, Thomas H. Holt and Almarin B. Paul.

April 23d.—California Immigration and Agricultural Co. Capital stock, \$1,000,000, divided into 10,000 shares of \$100 each. Trustees: A. E. Fraser, William Greene, Samuel Brannan, Erwin Davis, J. Gundlach, A. W. Nitsch and N. O. Arrington.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
April 27, 1897.

### CITY STOCKS.

Under the increased activity which pervades the Mining Share Market, city stocks have been somewhat neglected for some time past. Early in the week, Pacific Ins. Co. stock sold at \$122, and National at \$74 per share. Spring Valley Water realized \$66.50@67, and San Francisco Gas \$66@66.50. Twenty shares of North Beach and Mission R. R. sold at \$49.50 per share.

We call attention to the following important by-law recently passed by the Stock and Exchange Board, relative to "deposits on contracts."

"In any bargain made at the Board, except for cash, either contracting party may require of the other to make a deposit of not more than twenty per cent, the amount of purchase money as security for the fulfillment of the contract, and notice of such requirement shall be given on or before two o'clock P. M., of the same day. And should the stock contracted for vary in price to within five per cent. of the margin of said deposit, either party may call for an additional deposit of ten per cent., and may continue to do so as often as the last deposit may be exhausted by change of price—it being fully understood that either party may draw down any excess of twenty per cent. that may be in his favor. When the seller deposits his stock, the deposit paid by the buyer shall go to the seller. When a member of this Board neglects or refuses to put up the usual deposits on time contracts, after due notice of requirement, it shall be at the option of the opposite contracting party either to cancel the contract or continue it, by purchase or sale, through the President of the Board, with some other member, on his account, the defaulting party to be held responsible for any differences."

### MINING SHARE MARKET.

The improvement in the Mining Share Market, inaugurated some time since, has continued in a very material degree, and nearly all first-class stocks have been actively dealt in this week at higher rates. Recent developments in several claims are regarded with much favor, and more confidence in the future value of the Comstock lode is now felt than for a year past. The present fine weather has greatly improved the roads, giving teamsters active employment in carrying ore to the different mills. We understand that no settlement has yet been made by the parties representing the "short" interest mentioned in our last issue.

**HALE & NORCROSS.**—No sales during the week under review; \$3,500 per foot was asked. We have nothing of special interest to report relative to this company's mine. The new shaft is down 281 feet.

**SAVAGE**—has been rather quiet, though the comparatively few shares sold show an advance, opening at \$2,600 and gradually rising to \$2,750, and closing yesterday at \$2,775. This company's mine produced only 778 tons of ore during the week ending April 20th, of which amount 29 tons came from the old works, 116 tons from the sixth station, 506 tons from the seventh station, and 127 tons from the Curtis shaft works. The assay value is given at \$25.149, or \$32.32 per ton. The quality of this ore does not represent an average of the breasts, since most of it came from points where it could be obtained without timbering. This they were obliged to do on account of the short supply of mine timber, the Washoe grade being in such a condition as to prevent hauling; however, we learn that teams are now able to pass either way. It is said that some fine ore is obtained from the upper floors, at the southeast end of the breast on the sixth station, at which point it is believed a considerable body yet remains. In the seventh station, the breasts are said to look well, and from which a good quality of ore is taken. The drifts toward the ledge on the third station, from the Curtis shaft, are now in softer rock, as is also the sinking of the shaft toward the fourth station, which has attained a depth of 30 feet.

**CROWN POINT**—has been in marked request at enhanced figures, the sales having been much larger than for some time past, advancing from \$1,395 to \$1,500, buyer 3, receding to \$1,400, then selling at \$1,460 @1,450, and closing at \$1,460. During the week ending April 19th, owing to an accident to the engine, which delayed hoisting for a few days, only 350 tons of ore were taken from the mine. The lode on the 500-foot level is said to look very promising, and the drift on it extends some six feet to the north. In the west drift, same level, work is at present suspended for the purpose of putting a pump down and making preparations to sink for another level.

**YELLOW JACKET**—advanced from \$1,300 to \$1,350, seller 30, then sold at \$1,290, and closed yesterday at \$1,325.

**GOULD & CURRY**—receded from \$480 to \$450, and closed at \$500, b. 30. We learn that this company's mill continues to run upon ore from its own mine, but the supply is said to be rapidly diminishing.

**CHOLLAR POROSI**—continues in great favor and large sales have been made, opening at \$400, advancing to \$475@480, and closing yesterday at \$499. During the week ending April 20th, 2,400 tons of ore were sent to custom mills; previous week, 1,686 tons. The old Santa Fé station is said to be looking better than ever, especially in breasting north, where the ore is found to be of a much better quality than in any other part of the slope. The winze from this station is down 60 feet, and the bottom is said to be in good ore. Work has been suspended in this winze for a few days, on account of bad air. The drift which is being run to come in 127 feet below the Santa Fé station, has been already opened 100 feet. It is thought that if the ore keeps the pitch which it has in the winze, it will attain a width of about 70 feet in the new station. In the first station drift from the new shaft, the body of ore is said to be getting larger and wider every set they raise up on it. It is now about 60 feet long and from 10 to 20 feet wide, producing from 65 to 70 tons of ore per day.

**OPHIR**—has changed hands to a large extent, improving from \$345 to \$400, then selling at \$360@385, and closing at \$388. This company continues to drift south and north on the tenth station. In the south drift, a cross-cut has been run west to the ledge, but without developing ore at latest advices. The main drift south is in about 110 feet. The north drift has been recently started, and will reach the ledge in about 60 feet running.

**IMPERIAL**—has been well maintained within a range of \$278@282, and closed yesterday at \$275. The hollion returns of this company to the second clean-up of the present month, amounted to \$37,000, against \$29,000 for the same period in the month of March. The mills continue to crush the usual amount of ore—the Rock Point 90 tons per day, and the Gold Hill 40 tons. Preparations have been made to place buildings at the Imperial-Empire shaft.

**BELCHER**—advanced very rapidly from \$205 to \$355, dropped to \$250, then sold at \$300, and closed at \$310. . . . **EMPIRE** sold within a range of \$185@190. . . . **ALPHA** obtained \$400 per foot. . . . **BULLION** sold at \$32@47, and closed yesterday at \$50. . . . **OVERMAN** advanced from \$28 to \$42.50, and closed at \$35. . . . **CONFIDENCE** commanded \$36@38, then sold at \$47@60—an assessment of \$10 per share having been levied upon the capital stock of this company on the 23d inst.—and closed at \$52. . . . **DANEY** sold at \$7@10. An assessment of fifty cents per share was levied by this company on the 25th inst.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,294,057.

**NEVADA SURVEYOR-GENERAL'S REPORT.**—We have received a copy of the report for 1866 of S. H. Marlette, Surveyor-General of Nevada.

## Hazard's Powder.

**BLASTING AND SPORTING GUNPOWDER.**

SUPERIOR QUALITY.

Also, SAFETY FUSE OF ALL KINDS.

EDWARD H. PARKER,

Agent for the Hazard Powder Company, 224 California Street. 15v144f

## Professional Cards.

### SHERMAN DAY, Mining Engineer.

No. 114 Montgomery Block, San Francisco. Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines. 22q

### CHAS. LIEBENAU, Mining Engineer and Metallurgist.

(Graduate of the Mining Academy, Freiberg, Germany.) Oro, Flint District, Owyhee Co., Idaho. References.—George Hearst, John W. Oashwiler, Rebn, Henne & Co., and J. M. McDonald, San Francisco; E. R. Purdie, New York; William Bigler, Penn. 14v14-3m

### FREDERICK MANSELL, Mechanical & Architectural Draughtsman.

No. 422 California street, corner of Leidsdorff. Drawings of Monuments made for parties applying for patents at Washington or London. mar25-4f

### GREGORY YALE, Attorney and Counsellor at Law.

No. 18 Merchants' Exchange, (Battery and Washington streets.) Special attention given to obtaining Patents for Mining Lodes under the Act of Congress of July 26th, 1866; and Claims filed before the U. S. Registers and Receivers in any of the Land Districts in the State, and Contests before the Courts, under the Law, attended to. Opinions prepared upon all questions relating to Mining Laws. 1v14-1m

### E. V. JOICE, NOTARY PUBLIC.

N. E. cor. of Washington and Battery sts. 12v144f SAN FRANCISCO.

### GEO. T. KNOX AND E. V. SUTTER, COMMISSIONERS OF DEEDS.

NOTARY PUBLIC, 615 Montgomery Street, San Francisco. 15v144f

### JAMES M. TAYLOR, Attorney and Counsellor at Law.

COURT COMMISSIONER, appointed by the Fourth District Court, COMMISSIONER OF DEEDS for Nevada and Massachusetts. Court Block, San Francisco. Entrances opposite City Hall, Merchant street, and 636 Clay street. 14v144f

### W. E. GOLDSMITH, Card and Seal Engraver.

505 Montgomery street, up-stairs, (over Tucker's.) SAN FRANCISCO. Wedding and Visiting Cards printed with the utmost neatness; Notarial, Commissioner and Society Seals. 15v13-2q

### GEORGE H. POWERS, M. D., Gives exclusive attention to Diseases of the Eye.

Office, southwest corner of Bush and Montgomery streets, Room 7 and 8. Office hours, 10½ to 12, and 2 to 4 o'clock. References.—Rev. A. L. Stone, D.D., Ira P. Rankin, and L. B. Benchley. 4v13tr

### DR. H. AUSTIN, DENTIST.

No. 634 Washington Street, Between Montgomery and Kearny Streets (OVER SAN FRANCISCO BATHS) SAN FRANCISCO. 20v10-qy

### DR. A. HARTMAN, Electro-Magnetic Physician.

CURES ALL CURABLE DISEASES, BY THE CONCENTRATION of the vital forces. Nature's own method of cure. The blind made to see, the deaf to hear, the lame made to walk, and the sick healed. Come and see the afflicted at the rooms. They will speak for themselves. The poor treated free from 10 to 11 A.M. and 4 to 5 P.M. Operating rooms, 410 Kearny street, between Pine and California. 2v13m

### JACOB SHEW, Pioneer Photographer.

612 Clay street, north side, four doors above Montgomery. (Late 315 Montgomery street.) Takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v144f

### BLAKE'S PATENT QUARTZ CRUSHER.

**CAUTION!** The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866. This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages. Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast. 14v144f

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of April 13th: At no time since the discovery of silver in Alpine, have our prospects appeared as bright as now. So soon as the roads will admit, the pans for the George Washington Mill will be brought in. An abundance of good pay ore will be on hand at the mill. On Saturday a chimney showing five feet of good rock was opened.

News came on Thursday evening, that the twenty-five pounds of Tarshish ore, taken to Virginia City, yielded by assay \$1,200 in silver and \$200 in gold per ton, and that Mr. Graff had sent back a proposition to purchase all the ore in the mine at \$400 per ton and mine it himself.

From the Alpine *Miner* of April 20th: The lode struck last week in the Tarshish tunnel is now penetrated a distance of twelve feet, and no sign of another wall yet. The ore being taken out to-day is better, too, than any before found.

The Sam Booth Company have commenced operations on their tunnel.

## Amador County.

From the *Ledger* of April 20th: Tubbs' Mill has again been put in operation. They are now sinking on the mine, and the deeper they go the richer the rock becomes.

Coney & Bigelow will immediately erect the necessary works for reducing their sulphurets by the Plattner or Chlorination process.

The Mountain Mine, better known as the "Belding," has commenced operations again.

## Calaveras County.

From the Calaveras *Chronicle* of April 20th: Hoerchner, Grimm, Mayer & Co., Middle Bar Dist., have a 16-ft ledge. A tunnel 100 ft. in length, has been run directly on the lead, and good judges inform us that the rock extracted will average \$20 per ton. A mill will be erected during the coming summer.... Wesson & Co., in the same district, have resumed operations. As they go down, the lead increases in width, and the indications are flattering.... Alexander, Seaver & Co., have completed the mill on their claim in Rich Gulch, and will commence crushing next week. The battery of 10 stamps, will be run by a "hurdy-gurdy" water wheel, seven feet in diameter, and can work 20 tons per day.

Letter from West Point: The Carsner Bros. are about to put up a Wilcox pump to free their mine from water.... Mr. Lacy on Valentine Hill, has a shaft down 150 ft. The rock improves as the depth increases.

"Camanche" correspondence of the San Andreas *Register* of April 20th: Cat Camp is all the rage. Miller & Jennings have a claim which prospects from five cents to 50 per pan, taking the dirt all the way from top to bottom. They have run a cut a short distance into the hill, and have now from 12 to 15 ft. of dirt. Another company started in a hill directly south of them, and the first pan of dirt paid 15 cts. Coburn & Drevis have a claim which prospects well. Mr. Jos. Zimmerman has a claim, from which he has panned out \$85. He worked yesterday, (April 15), with a rocker, washing the surface dirt, as he took it from a new cut he had just started, obtaining \$10. There are other claims equally good. The ground prospects well in the gulches, on the hill sides, in the flats, and, in short, everywhere. I have seen Chinamen working with rockers where the dirt was not over 18 in. deep, and I am confident, from the appearance of the gold in their pans, that they make \$4 or \$5 per day. Steps have been taken to bring in a ditch this summer.

## El Dorado County.

From the Placerville *Courier* of April 20th: Work on the Shepherd mine, at Poverty Point, is prosecuted with vigor, and very rich ore is daily taken out. At Browns-ville, Messrs. Geo. W. Swan & Co., of this city, have, in the Independence mine, after running a tunnel for 200 feet, struck a fine ledge, and the rock is very rich. It is the intention of the company to put up a mill.

Coloma letter: Peterson & Nicholson have recently erected a first-class 5-stamp mill upon the "Danes" claim." The rock is mostly decomposed and mixed with red earth, which is very rich in gold. Since they discovered this claim, they have paid up all debts to merchants, etc., made each a matrimonial trip to the old country, and built a mill, all on the proceeds of rock freighted 18 miles to a custom mill. Last week, from a two days' run, they realized \$20,000. Dr. Nichol and the Tensher boys are supposed to be upon the same ledge as the Danes. They are taking out very rich

rock, and have erected an arastra. They have a 53-foot wheel, carried by water from one of the ditches upon the north side of the river.

## Kern County.

From the Havilah *Courier* of April 13th: Burdett, Bequette & Co. have struck very rich rock in the Sovereign ledge. The tunnel strikes the ledge forty feet below the croppings, and the body of pay ore is five feet in width. The rock is the blue sulphuretted rock of this district, and free gold is visible. An assay yielded at the rate of \$155 per ton.

## Klamath County.

From the Humboldt *Times* of April 13th: A correspondent says: Water is plenty, and the hydraulic claims are all doing remarkably well. The Black Bear quartz lead is turning out to be a big thing. The company have sufficient rock in sight to run their mill eighteen months, and it yields from thirty to two hundred dollars per ton. Of the copper mines, the Klamath company's claim looks exceedingly well.

From the Yreka *Union* of April 13th: Dick Humphreys gives us these notes of the Cottage Grove mines: The claim of Elliott & Co. is yielding from one oz. to \$20 per day to the hand. Aubey & Co. are making from one oz. to \$12 per day to the hand. Mullinax & Co., are making from \$10 to \$16 per day to the hand.

## Mariposa County.

From the *Gazette* of April 13th: Work still continues at the Hornitos quartz mill, now owned by Mr. Dyer. The last cleaning up showed a yield of from \$15 to \$18 per ton.

Same of 20th: The work of reconstructing the dilapidated condition of the Mariposa estate will commence as soon as the present manager can make his arrangements.

From the *Mail* of 20th: Richard Van Game recently discovered a gold mine about three miles from the Feliciano, on Sweet-water. The ledge is about two feet wide on the surface, and prospects at the rate of \$25 to \$30 per ton.

Coulterville letter: The Heslep mill and mine are now owned or managed by Mr. Pond and others. William Wright has sold to San Francisco men the mill and mine in the North Fork, near the Bower cave, for \$5,000 cash. William Hampton has struck a rich vein near Smith & Dudley's old ranch. He is now sinking on it. Douglas & Chamberlain are about to commence erecting machinery on their mine.

## Nevada County.

From the *Transcript* of April 18th: In Refuge Hill Dist., two miles north of this city, Stokes, Watt & Co. have struck first-rate gravel. The lead is supposed to be the extension of the old Nebraska ground.

Same of 19th: On Wednesday last, Leeth & Barton, on Deer creek, found a quartz pocket, from which, in a few hours, they took out over \$600 in gold. This strike was made near the door of Leeth & Co's cabin, and men had been walking over it for years.

Same of 21st: The owners of the Vanderhilt mine, at the head of Rush creek, have commenced an incline.

The Golden Gate mining Co., at San Juan, at their last run, cleaned up \$6,800. This company has heretofore been levying assessments.

Same of 23d: The English Co. at Badger Hill, near Cherokee, has now control of nearly all the ground on the hill, and opened a range of gravel that is very rich.

San Juan is livelier than it has been for years, and it is next to impossible to find a residence for rent. Two years ago it would have been easy to rent one-fourth of the houses in town.

Same of 24th: The incline in the Cunningham mine is now 200 feet below the surface, and a new level will be commenced. In the old drift, some excellent rock has been obtained lately.

From the *Gazette* of April 23d: E. W. Mull has recently sold his interest in the Buckeye claims, near Sweetland, to John Stidger, for \$9,000. The immense slide which, about Christmas last, covered the ground, is nearly worked off, and they expect to clean up in a week or two.

E. D. Dean has sold his gravel claims at Myers' Ravine, to Shively, Calkins & Co., for \$9,000 in gold coin. A ditch, leading water to the claims, and some other property, were included in the sale.

From the Grass Valley *Union* of April 20th: The rock in the Evening Star ledge, Grub Flat, looks well—every piece showing pure gold when pounded up.

Letter from You Bet to Dutch Flat *Enquirer* of April 24th: The old Dable & Webster claim, on Brown's Hill, is now paying \$20 to the hand. Ed. Williams is the present owner. George M. Nickell cleaned up \$1,800 after a run of ten days

with an expense of about \$700, leaving him over \$100 per day for his profits.

EXCELSIOR.—From the Meadow Lake *Sun* of April 13th: The Golden Eagle Co. have been taking some remarkably rich ore from their mine during the past two weeks.

Letter to *Enterprise* of April 19th: The California Co. are still sinking on their ledge, which is very promising. The ledge is now about eight feet wide, and they are not yet through it.

From the Nevada *Gazette* of April 20th: Captain White, just down from Meadow Lake, informs us that the snow is melting off slowly. The California mill is the only one running at present, the mill of the Grant Co. being stopped for repairs.

## Placer County.

From the *Stars and Stripes* of April 17th: Letter from Yankee Jim's: The Bradley claim is again in operation, with net profits of \$100 per diem. Mrs. Fitzgerald, who was one of the owners, has recently sold out to Mr. Donelin—one third share, there being three shares in all—for \$3,000. Dr. Harris, purchaser of the five stamp mill of Ambruster, on Georgia Hill, has, after a run of two weeks, closed down for the purpose of erecting five more stamps. The mill of the Borland brothers has not yet commenced operations.

Valley View correspondent of the Placer *Herald*: The Gold Quarry Company have one of the finest mills in the State. Mr. Crosby will erect a mill this summer. Mr. Hank Williams has recently struck a rich vein of gold bearing quartz and intends developing it immediately. Messrs. Huck & Co., are getting out very rich rock from their ledge. Valley View is on the former site of Whisky Diggings, and has a population of 150.

From the Dutch Flat *Enquirer* of April 17th: The Dutch Flat Company, in this place, after a run of sixteen days, seven men working, cleaned up the sum of \$3,003.51; B. Fitzpatrick after a run of eighteen days, \$2,480. Baldwin & Bailey after a run of thirteen days, \$1,040. The Golden Gate Company \$2,000 after a run of nineteen days. Huyck & Judd after a run of 17 days, \$2,000. The Moore, Taylor & Harriman claim from a run of twenty-two days, \$5,500; this is the largest yield ever obtained from any one run in the district.

## Shasta County.

From the *Courier* of April 20th: Over 20 men are now employed on the Chicago claim, and two tunnels are being run. The shaft is down 75 ft., and very rich ore is being taken from it. Eight tons of first class silver ore from the main shaft is now ready for shipment.

## Sierra County.

From Indian Hill letter to the Downieville *Messenger* of April 20th: Jones & Co. cleaned up \$1,040, after a short run. Charlton & Co. have as rich gravel as can be found in the State. Specimens of the cement show gold in great abundance. Andrus & Co. are tearing down the hill in a wholesale manner, and reaping a rich harvest. Bliss & McKean, two old men, while excavating a piece of ground for a reservoir, struck a lead which is paying them well.

Letter from Poverty Hill: Report has it that the Conway Co. have sold their claims for \$8,000. Hawkins is reported to have sold his remaining interest in this section, for \$9,000. J. H. Ferguson has sold out for \$10,000. John Conly and the Kingdoms, of La Porte, are the reputed purchasers of all this property. Preparations are being made to run a tunnel 2,500 ft. long, for hydraulic purposes in the spring.

## Siskiyou County.

Jos. Lang & Co. took from their claim on Humbug Gulch, last week, several chunks of gold of very respectable size. The largest weighed twelve ounces, and there were several others that weighed from two to six ounces.

E. Steele will commence work afresh on old Steamboat claim next week.

## Trinity County.

From the Weaverville *Journal* of April 6th: Fred. Deiner has been running two pipes all winter, and has washed off an immense amount of upper dirt. James Gardiner has purchased the claim on Stroufe creek worked last year by Draper & Johnson, and it is paying first-rate, now. One day last week he picked up a nugget weighing \$40. Quite a number of miners are now at work near the head of Buckeye creek.

## Tuolumne County.

From the Columbia *Citizen* of April 20th: Kane Bros. have opened a rich vein.... Friel & Co. have opened a new claim on the Columbia Gulch flume, which promises well.... The Portuguese on the burnt district are making good wages.... Ed. Skinner & Co. have discovered a sink in an old claim by the side of the road to Columbia, which

is paying \$3 or \$4 per day.... Harrigan & Haslam, Jo. Ginny and Dorsey & Co. are doing well.

## Yuba County.

From the Marysville *Appeal* of April 19th: The Jefferson Co., at Brown's Valley, opened through into the Pennsylvania mine yesterday. Both mills are now crushing good rock. There is no trouble between the two companies, as has been rumored.

The new machinery for the Bateman claim, consisting of an engine of 25-horse power, five stamps, a Knox grinder and amalgamator, etc., will start to-day for its destination. It is expected to be completed in 60 days. Men are at work day and night taking out pay rock.

From the North *Californian* of April 23d: We are informed that on Thursday last an immense land slide occurred in the Michigan mining claim at Timbuctoo, which will require two week's time to wash away from the Union and Babb Co's claims, they being entirely buried for some distance. The Babb Co. were ready to clean up, but owing to this occurrence will be prevented for some time.

## ARIZONA.

From the *Miner* of March 23d: W. Walker is now engaged with James S. Halstead in opening the Buena Vista gold and silver mine, on the Gila, 20 miles above Fort Yuma.

The Azlan mill and Umpqua mine continue rolling out the gold on a large scale. Woolsey's Ticonderoga mill is following suit, only a good deal more so—if we are to believe half we hear.

The Colusa *Sun* gives a letter from John A. Rush, dated Prescott, March 8th, from which we gather these items: From a ledge some 18 miles from here, we took from the surface 10 or 12 tons of quartz, and had it worked at a mill in the vicinity, with a yield of \$30 per ton. Next, from another ledge, 60 tons, and had it worked at another mill; it contained \$37.50 per ton of gold. We sunk a shaft to the depth of 54 feet—the ledge three feet in thickness. We have sunk a shaft on another ledge to the depth of 100 feet. The quartz has increased in richness as we have gone down. We have taken from this between 300 and 400 tons of quartz, the entire mass of which will pay \$25 per ton.

The Alta has a letter from Great Central Camp, Williams' Fork, April 3d, with these items: The Planet Copper Co. are now working only a dozen or fifteen men, and sending off, say 50 to 100 tons per month, to meet expenses.

The Mineral Hill, Empire Flat, and other mines, are being worked in a somewhat similar manner. It will not pay them to work a full force at present prices of copper.

The Springfield Co. have, as yet, taken out but little ore, and have no well opened vein which would justify the appellation of a mine.

The Great Central Co. have a large force at work. They are now opening a new lead called the "Marion," and have struck a vein of very rich green and grey ore. This vein was only a foot wide a week since, but they have already worked down on it until it measures two and a half feet, and is steadily widening. Their new smelting furnace, of large capacity, will fire up on the 6th inst., for the first time.

## COLORADO.

From the *Times* of April 2d: The shipments have been light this week, owing to severe weather. Several of the companies did not run their mills at all. The Gunnell Co. took out 150 ozs.; the Black Hawk 233 ozs.; Smith & Parmelee, 52 ozs.

From the Denver *News* of April 3d: We have seen to-day a very rich and splendid specimen of ore from the Bates and Hunter lode in Gilpin county. The mine is the property of the Nye Co., and shows a crevice of seven feet width, with 18 in. of fine ore.

At Georgetown, the Washington smelting works will be ready for work inside of a month. The Georgetown works will be ready for work before the end of April. The company is working the Anglo Saxon lode, and have out about 20 tons of ore which yields an average of \$1,600. The Argentine Smelting Co. will probably erect a large furnace in Argentine Dist. The Philadelphia Co. designs erecting extensive works this season. Scott & Packer, on the Nuckolls lode, have out several tons of ore, which shows from \$2,000 to \$3,000 per ton. They have a 3-ft. crevice and about 12 in. of ore. The Saginaw lode is promising; the ore averaging about \$500. The crevice is two feet, and the ore one foot in width. The Wilcox lode has a 6-ft. crevice and eight in. of ore, which pays about \$1,000 to the ton. The C. H. Moore pays about \$200.

## IDAHO.

From the Lewiston *Journal* of April 5th: The placers which have recently been dis-

covered on the tributaries of the Palouse, and the manner in which the gold is found, warrant the belief that much richer gold deposits exist to the east of the present Palouse diggings.

Several parties recently in from Gold creek report the prospects obtained from the hills to be from four to six cents to the pan. Quite a number contemplate a visit to these mines. The distance is about 45 miles from this place.

Four miners came in from Guat creek yesterday. Some new discoveries had been made on the benches bordering on the creek. One of the men informed us that he saw washed out 13 pans of dirt from the new discoveries, which produced an average of 18 cents to the pan, in gold, and in no place was the bed-rock reached. One man informed us that the claims of the company of which he was a member will average from \$3 to \$10 per day to the man with their sluices.

Expressman Hunt reports that mining has not been resumed to any considerable extent in Warrens, as the water had not yet risen sufficiently. The miners of that camp have formed themselves into a joint-stock company for the purchase and erection of a quartz mill. Capital stock, \$10,000. Half the stock is already taken. Those who take shares will have the amount of their stock credited to them as so much done in representing their claims under the laws of the district.

From the Owyhee *Avalanche* of April 6th: The Cosmos mill started up in the early part of the week, but did not get fairly under way before Wednesday. It is now running smoothly.

#### MONTANA.

From the *Post* of April 6th: The "clean-up" of rock from the Black Lode, mentioned last week, was from the tables alone. The gold in the batteries was not counted in. The rock averages over \$50 per ton.

The Hawkeye mill is at work on Kearsarge rock. No clean-up was made for last week. The Christnought mill works well, and the rock crushed last week yielded in the neighborhood of \$100 per ton. Messler & Butler have completed the tunnel on the Butler lode, and struck the lead at a depth of about 200 feet from the surface. The tunnel is 225 feet long, and the crevice eleven feet in width.

Mr. Randall is about to commence the erection of buildings for the mill of the Hot Spring company, in Ramshorn district. The mill has eight stamps and a rotary crusher, and will be in operation by the 1st of June.

The last cupellation from 19½ tons of Legal Tender rock yielded 210 pounds of silver; coin value, \$3,523.

Letter from Bear Town, March 18th, says: Oliver & Co., in prospecting the newly-discovered Cayuse Gulch, struck, last Friday, very good prospects in the gravel. From five to fifteen cents to the pan have been obtained, and they are not within four or five feet of the bed-rock. The shaft is about twenty-five feet deep.

Letter from Highland says the boys are making every preparation for the spring work.

Another says the Red Mountain shaft is going down rapidly. Work on the Golconda progresses slowly.

Summit letter says the crevice on the Butler lode is eleven feet where Messler & Co. struck it. The Lucas Co. are getting rich ore, and keep their 24-stamp mill running day and night. The Nelson lode is turning out some very rich quartz.

Claims at Calkin's Dist., El Dorado Bar, are laid over until June 1st, not being in a condition to work.

HELENA ITEMS.—Turnley's mill cleaned up 300 ounces of retort from Whitlatch Union ore, as the net result of eight days' run.

The Boulder ditch will be seven miles long, and will carry 2,000 inches of water to Montana Gulch, Gold Hill, Montana Bar and Diamond City Bar. An iron pipe, 1,700 feet long and 22 inches in diameter, costing \$40,000, will convey the water across the upper end of the gulch. The principal stockholders are Metcalf & Speigler, who took half a million of dollars out of Confederate Gulch last summer.

From the Helena *Gazette* of March 30th: Dr. La Croix is down 30 feet on the Trappan lode. The crevice is 28 feet, with ore that assays \$600 to the ton. He has 200 tons ready for working. The Arkansas has a seven-foot crevice.

Jofferson City letter to same: During the coming summer we expect several smelters to be in active operation near our town. The report from the Gregory lode is very flattering, showing a constant improvement in the quality of the ore.

Letter from Bear Town: Many claims are

paying well, and this will be a lively camp this summer.

Argenta letter: The furnace of the St. Louis & Montana Co. has been running for the past few weeks, and has produced good results. The chief drawback has been the want of a proper clay for furnace linings.

#### MEXICO.

A letter to the *Alta* from La Paz, Lower California, April 4th, says: The Triunfo Mining Co., the only one in the Territory at this time in full operation, has been doing very well during the past 40 days, turning out hulsion, as I am informed, to the amount of \$25,000.

Mazatlan letter says: The last sign of returning confidence is the impetus given to mining in this State. Several companies are doing first rate, and the silver bars, which were kept in the ore for more than two years, are now rushing into the mint of Culiacan.

#### OREGON.

The Jacksonville *Sentinel* says of the newly discovered mines in Southern Oregon; the district is in the mountains north of Rouge river near the headwaters of Jump-off-Jo. The locality very much resembles Boise Basin—in miniature. Prospecting, thus far, has been limited to the creek and a few gulches, on account of the snow. It is stated, by persons who have visited the district, that diggings that will pay from \$3 to \$15 per day to the hand, have already been discovered.

#### NEVADA.

##### Black Rock.

From the *Eastern Slope*: C. C. Goodwin informs us that the citizens of Susanville, are well satisfied with the prospects of the Black Rock mines. Ward and Bowman have by a process of their own succeeded in working the ores in small quantities, and there is no apparent reason why the same should not work equally well on a large scale.

##### Esmeralda.

The *Trespass* has seen a 60-oz. gold bar, worth \$1,148 from Todman & Cheever's mill, Pine Grove. Assays of ore from Washington Dist., gives \$10 gold to from \$190 to \$290 silver per ton.

From the *Gold Hill News* of April 20th: A new excitement has broken out in regard to a district 30 miles southeast of Wilson Dist. Some of the ore was tested, giving a return of \$312 per ton. The ledge is reported to be 11 ft. wide. There has been a general stampede from Pine Grove. The news spread through Dayton like wild-fire.

##### Humboldt.

From the *Register* of April 13th: The Star City Co. have purchased of White & Wehler, 1,000 ft. of the Golconda lode in Gold Run Dist. Besides paying a round sum in cash, the company contract to erect a mill of sufficient capacity to work 16 tons of ore per day by the first of September next; White & Wehler to own one-half of the mill and mine when the mill is completed. This mine bids fair to rival the Montezuma in extent, while its ore can be worked at half the cost.

Mr. Torrey's furnaces are nearly completed, and his teams are hauling ore. He has over 50 tons ready for the furnace, he sides 500 tons out at the mine. He designs smelting 200 tons on the first run. His ore is equal in richness to the best of the Montezuma, and apparently the supply is inexhaustible. He has some 40 hands at work. By the time he fires up his furnaces his expenses will be \$30,000, but this he expects to get back in the first run and we have not the least doubt but that he will.

The Washington Co. which suspended operations on account of the deep snow, will resume in a few days.

The *Enterprise* says that 10 tons of crude hulsion from the Montezuma mine, in Arabia Dist., is now on its way to California. It is composed largely of lead, only about 200 lbs. in a ton being silver. Freight from the mine to Cisco is 2½ cts. per lb. Thence it goes by rail.

##### Pahranaagat.

From the *Trespass* of April 19th: J. S. Bean informs us that the Illinois Co. has a ledge 26½ ft. wide, with ore assaying \$6,000 per ton. Timber is scarce in the district, but there is a tolerable supply of firewood. In the valley, 10 miles from the mines, where most of the reduction works will be built, water is abundant for milling and agricultural purposes. Croppings of rich coal are also found near by.

A letter to the Salt Lake *Vedette* says: We have mines and ore enough here, of a superior quality, to engage 500 stamps for the next 10 years, without sinking over 20 ft. below the surface. Crippin's Co. are running a tunnel to strike No. 3 claim, west of the Illinois. They are also pushing a tunnel in on the Indiana lode. The Ely & Sanderson and other lodes are being developed with very encouraging prospects.

The San Bernardino *Guardian* has discouraging reports from a party just in from Pahranaagat. Pastboard checks, issued by the stockholders, form the only circulating medium. Water scarce and unfit to drink, especially in summer. One of the party declared that he did not think there was more than one paying mine in the whole district.

##### Reese River.

From the *Reveille* of April 13th: The Mount Tenabo Co. will erect a new mill in Cortez Dist. Geo. Chellis has arrived with the intention of conducting operations.

The Sherman shaft on Lander Hill, has been sunk 104 ft. in 52 days. It is 15 by 5 ft., and thoroughly timbered.

On Wednesday last, steam works were for the first time used on the Magnolia, Lander Hill. Eight and a half tons of ore produced upwards of \$3,400, a few days since.

Same of 16th: J. W. Varney has leased the Empire mill in Yankee Blade Ravine.

The Germania & Bismark, at Milk Springs are large and well-defined ledges. Ore was brought in yesterday for reduction at the Kingston mill.

Same of 17th has an editorial in allusion to the great rush to Silver Bend, and cautioning prospectors who expect to get along with just money enough to get there. It is not like a placer gold region. Capital is absolutely necessary to open up the undoubtedly rich ledges. A man may suffer and starve, while the owner of a silver vein is worth a million of dollars.

Same of 18th: By yesterday's stage 3,560 ozs. of crude bullion came from the mill of the Social and Steptoe Co. at Egan Cañon.

Same of 19th: A pulp assay of ore from the Fisherman ledge gave \$492.98 per ton.

From the *Silver Bend Reporter* of April 13th: An assay of ore from the north shaft of the Silver Bend Co., on the Transylvania, gave the yield of \$5,566.68 to the ton. The shaft is 95 ft. deep.

The Fisher ledge, at Milk Springs, is four feet thick, with splendid rock.

Operations upon the Quintera ledge, will be resumed about the 20th inst.

Work was resumed on Thursday upon the Arizona mine. Prospects are flattering.

At North Twin River, a 3-ft. stratum of ore worth several hundred dollars per ton, has been disclosed in the Murphy, No. 2, at a depth of 40 ft.

The Titan ledge, in Manhattan Dist., is 60 ft. in width, and averages \$57 per ton by assay. This is 15 miles southwest from Belmont.

At Hot Creek, the Merrimac and Indian Jim Cos. have united for the purpose of prospecting the Indian Jim ledge. Their shaft is 40 ft. deep. The Shenandoah ledge has been sold to an Eastern company.

At the Silver Bend Co.'s claim on the Transylvania ledge, there is now nearly 200 tons of ore piled up ready for milling, at the north shaft, which will work \$200 per ton. At the south shaft 400 tons that will probably yield \$125 per ton. The company will erect a 24-stamp mill this summer.

By the first of October there will be 84 stamps, engaged in the reduction of ores from the Highbridge and Transylvania ledges as follows: Combination mill, 40; Silver Bend, 24; Belmont, 20 stamps. By that time each of these companies will have ready for reduction, a quantity of ore, much of which will yield \$500 per ton. At \$200, the combined hulsion product each month of those three companies will amount to \$252,000. Many predict that this will be below the mark.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Trespass* of April 15th: At the south shaft of the Yellow Jacket mine are to be forthwith erected two double engines of 180-horse power, 14-inch cylinders, and 30 inches stroke. These will be used for hoisting ore, while the Corliss engine now in use will drive the pumping machinery.

Same of 16th: Fifty tons of Yellow Jacket croppings are now being worked daily, in addition to the ore raised from the shafts.

Same of 17th: We saw, to-day, two splendid specimens of silver ore from the Highbridge ledge, Combination Co. and Buel claim. One weighs 14 and the other 13 pounds, and an assay shows a value per ton of \$14,300. It can hardly be said that these are quartz specimens, but rather that they are silver specimens mined from the hanging wall of the ledge, with a pedestal of slate, a garnishing of quartz, and an entirety of chloride, horn and native silver ore above the casings. The ledge is 14 feet in width, and is said to be equally rich from wall to wall.

Same of 18th: All conveyances to Belmont and vicinity are crowded.

We learn that a fine body of quartz has been sent in the fourth station of the Gould & Curry.

Same of 19th: The croppings of the Theall ledge have been assayed, and yesterday a gold bar, .999 fine, weighing 144 ozs., was turned out.

Same of 20th: The Eclipse mill is running steadily on \$300-ore raised by a windlass through the incline.

The Bowers and Plato are now raising through both tracks of their incline, daily, 150 tons of ore, that mills about \$30 per ton.

From the *Territorial Enterprise* of April 16th: For several days past the works of the Savage Co. have been idle on account of having no wood—though they managed to get enough fuel to start up their pump last night. Their mills, and in fact all the mills in Washoe Valley, are waiting for ore, but it will be at least four or five days before loaded teams can pass over either the Ophir or Geiger grade.

Same of 17th: On the Gould & Curry, Mr. Hatch, the contractor, has 40 men employed, and is taking out daily 75 tons of ore, worth \$20 per ton and upwards.

The Industrious Co., Summit Lake Dist., four miles north of this city, have three shafts on their 10-ft. lead, of what is thought to be \$80-ore.

The pumping machinery on the Sierra Nevada will be started by the 1st May. At present the Co. succeed in keeping the water in the shaft stationary by means of a large cask with a valve in the bottom for filling and emptying.

The Ophir and Mexican shaft is down 635 feet, and at this depth drifts are being run east and north in search of the lead.

The Central mill, which has been arranged for wet crushing, is now engaged in the reduction of Savage ore. The old roasting furnaces are no longer used, and have tumbled in.

The framework of the Hoosier State mill is up.

Same of 21st: The other day, Harvey Beckwith, Supt. of the Chollar-Potosi, run a drift hack in the direction of the old Chollar croppings, and struck a splendid deposit of ore, estimated to contain at least 100,000 tons. At the present time this mine is yielding 400 tons of ore per day, paying \$20 per ton and upwards. They have fine bodies of ore in the new shaft—in the old works—everywhere. The mine was never before in so flourishing a condition as at present.

From the *Gold Hill News* of April 20th: From the office of Wells, Fargo & Co., in Virginia, there were shipped, last week, 6,520 pounds of assayed hulsion, valued at \$234,101.67; from their office in Gold Hill, 2,640 pounds, valued at \$75,334.42.

The Carson *Appeal* says the workmen on the O'Reilly ledge struck, after running a drift some 26 feet from the bottom of the 90-foot shaft, lately sunk, an immense volume of hot water, which drove them all out of the work. This is thought, taken in connection with other encouraging indications, to be one of the best signs of the proximity of a real fissure vein.

BREAKAGE OF STAMP-STEMS.—We have been told by those who claim to be intimately acquainted with milling operations in both Grass Valley and Virginia City, that while the breakage of stamp-stems (iron) is a thing almost unknown in the former place, it is a serious evil and cause of expense in the latter. The breakage, we understand, is just above the junction of the stem with the stamp. We have been told that the average duration of a stamp-stem in Virginia City scarcely exceeds twelve months. The breakage is supposed to be the result of a partial crystallization, caused by the vibration from the jar of the blows. The broken stems are mended by welding, until the iron becomes too much crystallized for that operation.

If the fact is as stated, what is the cause? The stems employed in Virginia City are generally made of from 2¼ to 3¼ iron. Those in Grass Valley are usually larger; but the stamp-heads used there are also larger, in about the same proportion. Are the methods of securing the stems to the heads the same in both places? The iron certainly must be of the same quality. We should be pleased to hear from some correspondent who may be fully posted on this matter, both in Virginia City and Grass Valley.

## Mining and Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.  
DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansons, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance, \$5 00  
One copy, six months, in advance, \$3 00  
For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For references, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

**Mr. A. C. Knox,** is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

**San Francisco, Jan 11th, 1866.**

**Mr. L. W. Felton,** is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1865.

**Mr. Geo. P. Fitts** is duly authorized agent for the Mining and Scientific Press. March 23, 1867.

**Mr. S. G. Steele** will act as agent for the Mining and Scientific Press from this date. April 27, 1867.

**Mr. Chas. W. Marlette** is agent for this paper in in Colusa county and vicinity. April 27, 1867.

## San Francisco:

Saturday Morning, April 27, 1867.

## Notices to Correspondents.

**COAL SEEKER, Mt. Diablo.**—The sinking of a shaft in supersaturated loose sand, loam or similar ground, or the driving of a tunnel through the same, is perhaps one of the most difficult operations which the civil engineer is called on to perform. Brunel found this the case in making the Thames tunnel, and hundreds have found the same difficulty in the northern English coal fields when endeavoring to win the sublying carbonaceous prize by first piercing the lowest bed of the new red sandstone. The former surmounted his difficulty by the use of framed boxes, called a shield; the latter attained the same end by what is termed "tubbing" of late years, always composed of iron. The most noteworthy instance of success attending indefatigable perseverance, directed by high theoretical ability of the latter character, occurred on the banks of the Loire, under the direction of M. Triger, where repeated efforts to reach the coal measures through a thick bed of alluvial and water-saturated sand had failed. The mode adopted was to pump into the iron cylinder, which lined the shaft, an amount of air sufficient to produce a pressure on the bottom equivalent to the external pressure of the mud and water. This was accomplished by placing a cover over the upper surface of the cylinder, through which two pipes were inserted, one to convey the compressed air into it, the other dipping into the liquid substratum; by means of the latter, a stream of mud and water was conveyed to the surface when, from any circumstance, its influx could not be prevented by the entrance of the compressed air by the other pipe. In order to enable the workmen to enter and leave their work without disarranging the equilibrium of the forces required for the due working of the apparatus, M. Triger adopted the principle of the canal lock, by fixing an upper chamber in the shaft, in which, when the upper door was closed and the lower one opened, both were filled with compressed air. When the lower one was closed and the upper one opened, the air-lock was closed by the pressure of the sublying column of compressed air. By this means men and materials could easily be, from time to time, introduced without any derangement of the chief operation. M. Triger in this way succeeded in piercing a stratum of flowing soil to the depth of eighty-two feet, thus establishing the fact that human life could not only be supported, but work carried on for several hours at each shift of men, under a pressure of three and a half atmospheres, or fifty-two and a half pounds to the square inch.

**"FARMER," Santa Clara.**—You are right. It is easier to pull a wagon loaded with a ton of hay than it is to pull the same wagon loaded with the same weight of iron over the same road. The philosophy of this may be accounted for from the well known fact that the hay does not rest a dead weight on the axles as the iron does. Its elasticity buoys up and, as it were, "floats" the load over the slight obstructions encountered. The conditions, however, must be a calm atmosphere, as the existence of a high wind might reverse the result, and make the bulky article the heaviest load.

## Foundry and Machine Work.

One of the best evidences of the increase of the foundry and machine work business in this city, is the growth exhibited by the Etna Iron Works (Hanscom & Co.) at the corner of Fremont and Tehama streets. A full year has not elapsed since they were first started, yet a stranger, on visiting them, would suppose that it was an old establishment. Busy hands are seen on all sides, employed on a great variety of work and in every stage of progress, from the original design in the drawing room, through the pattern shop, the molding room, the foundry and the finishing room.

In taking a hasty glance of the works, a few days since, we were pleased to witness these signs of activity and prosperity. Among the work now being turned out at this foundry, we noticed a large amount of architectural castings, for the new Faneuil Hall Market, in process of erection between California and Pine streets, consisting of pilasters, columns, girders, etc., amounting to nearly 150 tons.

An elegant flight of cast iron steps, with ornamental balustrades, for the new Fireman's Fund Insurance Building, now being erected at the corner of California and Sansome streets, and a large quantity of iron work for a block of stone buildings in process of erection by E. H. Sawyer, of Vallejo. This last work, by the way, is among the first of some extensive improvements which have been set on foot in the old State Capital, in anticipation of the early completion of the Vallejo and Marysville railroad, which, it is expected, will be completed to Sacramento by the first of January next.

Among the curiosities at these works is a huge cast iron kettle for Scoville & Co's new candle works at the Mission. This kettle is some six feet in diameter by six feet deep, with perpendicular sides of three feet. Its capacity, we are informed, is, not far from 1,200 gallons. The lower portion of the kettle is made double, the chamber between the walls being used as a steam jacket. The bottom of the kettle is one inch thick, gradually decreasing in thickness to the top of the steam jacket, where it is five-eighths.

We never go into this establishment without seeing a greater or less number of workmen engaged upon Dunbar's piston packing. Of course we did not fail to meet with it again at the time of our recent visit. Our attention was also arrested by a mammoth retort, of a size sufficient to retort one ton of amalgam at a charge. It was being constructed for Trenche's mill, at Silver City. They are also building several newly-invented concentrators for Wheeler & Randall, quite different from anything we have yet seen in that line; also a new amalgamator, recently invented by Mr. Hesse, of this city, which will be known as "Hesse's Centrifugal Amalgamator." We shall notice both of these machines more fully at some other time.

A large number of grate bars are being manufactured here, recently invented by U. S. Boiler Inspector Bemis, and designed especially for facilitating the burning of Mt. Diablo coal. These grate bars are being extensively introduced into use on this coast.

Several of Wheaton's reaping machines are being made here. This is a valuable California invention, and its manufacture here is a sufficient proof that California can manufacture her own agricultural machinery, and invent it, too, if we cannot be allowed to make machinery of Eastern invention. The home manufacture of agricultural implements would save to this State, and for our mechanics, an immense sum of money every year.

There is another hunky article of manufacture for which we are annually sending hundreds of thousands of dollars out of the State. We allude to stoves of various patterns. We were pleased to see a large number of Tay, Brooks & Backus' Monitor stoves in process of manufacture; also the petroleum stoves, such large numbers of which are now being introduced into

this city. These stoves were at first imported; they are now being made here, as all other stoves should be.

Among the economical and progressive features we noticed first, was a mechanical arrangement for separating the earthy matter from the furnace slags, by which the usual melting loss of not less than five per cent. of the total amount of iron which goes into the cupola is saved at a trifling cost. The noisy fan-blowers, which keep up such a deafening humming in most foundries, has been replaced here by Root's Blower, a late Eastern invention, which not only works almost noiselessly, but also effects a saving of about one-third in power. This is a very ingenious and perfect machine, but difficult of description without an illustration.

They are also using one of Carvalho's Superheaters, which may be easily attached to almost any boiler in use. Its employment admits of the use of a much less pressure of steam to do the same work, thus lessening the danger of explosion and saving fuel. It is perfectly under control, and is safe as an ordinary steam conducting pipe. The superheaters are manufactured at this foundry. We shall endeavor to describe them in a future number.

**CEMENT WORKING.**—Mr. A. J. Hunter recently visited the cement mill at Wisconsin Hill, Placer county, near Iowa Hill, for the purpose of putting four of his concentrators into that mill. The company had become satisfied that they were losing gold, but attributed the loss to its extreme fineness and "rusty" condition. Mr. Hunter found that they were using screens with one-eighth inch holes, and suggested a trial with finer screens. In order to ascertain more satisfactorily the value of such a change, several tons of cement were put through the battery as it stood, battery amalgamation and copper plates being used. The sulphurets were concentrated on blankets, in the manner usually adopted in quartz working, and afterwards submitted to a careful pan working. The result was that eighteen per cent. of the gold was obtained from the battery and plates and eighty-two per cent. from the pan.

The old screens were now removed, and new ones, with about one thirty-second of an inch holes, substituted. The result of the change was, that ninety-nine per cent. of all the gold was found in the battery. The tailings (saved by blankets as before) showed but a mere trace of gold by either the pan process or a fire assay.

These results are certainly very remarkable, and well worth recording, although they are doubtless quite exceptional cases, as the gold in this claim is exceedingly fine for cement gold.

A panful of tailings was caught from the waste sluice of a neighboring cement mill, about half a mile distant, and carefully washed down for such free gold and sulphurets as it might contain. This concentration yielded only \$1.50 to the ton. The screens at this mill are about one-sixteenth of an inch in diameter, and the gold is coarse and more easily saved than that from the Wisconsin Hill claim, which must chiefly account for the difference in the value of the waste sands from the two mills.

These experiments are very interesting and valuable. Perhaps one of the most important items of interest connected with them are the facts that the sulphurets from these claims are not auriferous, while it is pretty well established that the sulphurets from some of the cement claims are valuable, especially from those in and about You Bet.

**THE WINE CULTURE IN CALIFORNIA.**—H. H. Bancroft & Co., the publishers, have sent us a copy of this little pamphlet. Henry Gihbons, M. D., is the author. It takes the ground that alcohol is poison, whether in wine or anything else; and insists that the idea of promoting temperance by substituting wine for strong drinks, is "fraught with danger."

**CANADA GOLD MINES.**—It is said that the arrival of gold-hunters at Madoc numbered hundreds in one day. The prospects are good. Claims are sold at high prices.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**A WATCH WITHOUT HANDS,** that shows on its face no figures but those which tell the hour and minute looked for, has recently been invented in London by a Mr. Barlow. The figures are displayed as they are wanted, and no others appear on the watch face.

**A NEW RESPIRING APPARATUS,** designed for use by firemen at fires, has been invented by Andrew Gullibert, of Paris, France. The apparatus consists of a flexible bag, containing twenty-five gallons of air, fastened to the back firmly, with the tube to the mouth. One of the machines was recently tried at Chicago, and pronounced entirely satisfactory, the operator remaining over fifteen minutes in the midst of dense smoke. It is believed it will be a very valuable invention.

**AN ELECTRICAL BURGLAR ALARM.**—Mr. G. Kellogg, of Oakland, has invented an instrument which he calls an electrical burglar alarm. It is so contrived that whenever a burglar attempts to enter a house the instrument gives instant notice to the police, giving the name of the street and number of the house in which the thief is operating. A caveat has been filed, preliminary to taking steps to secure a patent for the invention.

## PATENTS RECENTLY ISSUED.

62,983.—**MACHINE FOR CONCENTRATING ORES.**—Thos. Varney, San Francisco. I claim, 1st, The use of the disk, A, divided into compartments.

2d, The trough, B, all constructed in the manner and for the purposes set forth.

The above invention relates to the Varney Separator, which has already been described in our columns.

63,086.—**IMPROVEMENTS IN ADJUSTABLE HANDLES FOR FRUIT BOXES.**—Cary Peebels, Santa Clara county, Cal.

I claim a handle, A, constructed with the arms, b b, and prongs, c c, similar to that herein described, substantially as and for the purpose set forth.

The object of the above invention is to provide an adjustable handle for strawberry boxes to be used in picking the fruit, so constructed as to clasp the boxes and hold it until filled, after which it can be easily detached and applied to another box. The necessity for such an invention will be found apparent, from the fact that berries, especially strawberries, should be sent to market in the same boxes in which they are gathered, on account of the necessity of preserving the berries perfect, which cannot be where the necessity exists for rehandling and repacking. In most cases strawberry boxes are round or square, with no convenient handle or arrangement for holding, except by clamping by the thumb upon the top or edge of the box, with the fingers placed underneath for support, which soon becomes very tedious and wearisome for the hand; and in no case can more than one hand be employed at the same time. By the use of this invention, the box can be so attached to the body that both hands may be employed in picking the berries.

62,602.—**SHAKING TABLE FOR CONCENTRATING ORES.**—P. S. Buckminster, Gold Hill, Nevada.

I claim the rifles, h, b, running diagonally across the bed of a shaking table in combination with spring, e, e, at one end and the adjustable slides, d, d, for concentrating gold and other ore, arranged and operating substantially as herein described.

62,619.—**COMPOSITION FOR ROOFING.**—G. L. and H. Egan, San Francisco, Cal.:

We claim the composition of the manufacture of drain-pipes, molding, roofing, etc., the ingredients of which are prepared and combined in the proportion and manner substantially as herein described.

**DRY DOCK.**—The contract for the iron work on the new dry dock has been awarded to the Vulcan Foundry. It includes two high-pressure engines, with 22-inch cylinders and four foot stroke; four hoilers, of best American iron, sixteen-feet long and fifty-four-inches in diameter, and large centrifugal pumps capable of throwing 150 tons of water per minute. The work is to be completed in ninety days.

Established in 1849--Corner First and Mission streets, San Francisco.

**HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW** prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenus Wheeler's improved flat bottom pan, Beid's pan, Veatch's tubs, Prater's concentrators, Wakley's pans, Beers' pan, German Barrels, Arastra, Caring, Childs Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

**ANOTHER SWINDLE.**—The Virginia City *Trespass* publishes a letter lately received by the Postmaster of that place from Warren, Pennsylvania, making these inquiries: First, whether there is such a mining company as the Mount Vista Gold and Silver Mining Company, of Humboldt county, Nevada. Second, whether the company is working the mine. Third, were any dividends ever declared. Fourth, has the company any machinery, such as engines, stamps, etc.

The *Trespass* takes upon itself the replying to these questions: "In the spring of 1864 a Frenchman, who said his name was Petite, located a piece of excellent garden ground on the north slope of a spur of the Humboldt Mountains, half a mile distant from Unionville, the shire town of Humboldt county. This location he styled the Mount Vista Gold and Silver Mining Company, and the same was duly recorded in the books of the Register of that district. Interrogatory second: 'Is the company working the mine?' Answer—Petite left the sum of \$8 coin, with which to develop the lode. A miner ran a cut in the rich soil about six feet, it taking said miner two days to accomplish the work, for which he received his regular \$4 per diem, miner's wages in Nevada. Since that hour the claim has never been disturbed. Third interrogatory: 'Have the company ever declared any dividends?' Answer—Some two years since Capt. Warner (the Postmaster) received a letter from the Secretary of the company, then in New York, enclosing him a piece of the stock, and quietly informing him that if he (Warner) would send to New York representations favorable to the mine, a large amount of money could be made, of which Warner should receive his share. Warner did not answer the letter, but we have learned that a dividend has been declared by the company of 1 1/2 per cent on the capital stock, and paid to a few stool-pigeons and suckers who held stock in the Mount Vista, in order to make a showing on Wall or Chestnut streets. To the question whether the company has engines, stamps, etc. We answer—We never heard of it having an engine; certainly never in Nevada; but if it has found a sufficient number of fools in the East, it is more than probable it has got 'stamps' and is doing well."

## Golden City Chemical Works.

LABORATORY,  
Corner of Seventh and Townsend Streets.  
OFFICE,  
Corner of Montgomery and Bush Streets.

CAPITAL STOCK, --- \$500,000

Trustees:

H. P. WAKELEE, THOS. H. SELBY,  
NICHOLAS LUNING, THOS. BELL,  
CHAS. E. McLANE.

H. P. WAKELEE.....MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH  
Sulphuric, Nitric and Muriatic Acids of superior quality,  
in quantities to suit.

Orders will be received at the office only for Chemicals of  
every description, which will be manufactured as may be  
required. The Company beg to say that they have the ad-  
vantages of all improved machinery and apparatus for the  
manufacture and manipulation of these products, and our  
Laboratory is fitted up with the most recent improvements  
which experience and science suggest, and is surpassed by  
none in completeness and perfection for the purposes it is  
designed. 9v14 3m

## Overland Route.

## THE PENINSULAR AND ORIENTAL

STEAM NAVIGATION COMPANY'S  
STEAMSHIPS

Leave Hongkong Twice a Month,

On the 1st and 15th in the Northeast Monsoon,  
and about the 11th and 20th in the  
Southwest Monsoon.)

—FOR—

SOUTHAMPTON AND MARSEILLES,

VIA EGYPT,

Calling at Singapore, Penang,  
Point de Galle, Aden, Suez, Alex-  
andria, Malta and Gibraltar.

From Point de Gallo their steamers run to Madras,  
Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.

From Hongkong their steamers run constantly to  
Swatow, Amoy, Foochow, Shanghai, and Yokohama.  
Hongkong, 1867. 13v14tf

## PATENT BUSINESS.

We have lately associated with us in the Patent and Me-  
chanical Department of the Mining and Scientific Press, a gen-  
tleman of superior ability and attainments, who has ar-  
rived direct from the leading patent agency in New York  
city, and having faithful and reliable associates in Wash-  
ington City, we are now better than ever before prepared  
to secure the claims of our applicants, in a careful, prompt  
and efficient manner.  
San Francisco, Jan. 1867. DEWEY & CO.,  
Patent Solicitors.

**Enemy in Advertising.**—The Mining and Scien-  
tific Press is the best and most economical mining adver-  
tising medium in this city. Our terms are less than one  
half the rates now charged by daily newspapers, and the  
mining community are beginning to appreciate our reasona-  
ble rates of advertising. The Press contains, proportionally,  
a larger amount of mining advertising than any other paper  
on the Pacific coast. Its character renders it the proper  
journal for the concentration of mining patronage.

## Metallurgy.

## EUROPEAN METALLURGICAL WORKS,

—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphur, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, reducing by cupellation, done at moderate rates.

### PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

S. P. KIMBALL,

J. R. MURPHY.

## MOSHEIMER'S

## Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphur.

### CONSULTATION OFFICE:

328 Montgomery street, San Francisco.  
J. MOSHEIMER,  
25v13-3m Engineer and Metallurgist.

## J. A. BAUER,

## To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS  
County, with steam mill fitted up with Amalgamating  
Pans, etc., FOR SALE. The mine has three main veins, and  
more than \$30,000 have been spent in opening them and com-  
pleting the mill. Good wagon roads all the way. Apply to  
BELLOC FRERES, Bankers,  
533 Clay street, San Francisco.  
23v13-6m

By MAIL.—The Mining and Scientific Press will be sent by  
mail to any part of the civilized world. In case of removal  
subscribers have only to inform us of the post office address  
of their old and new location, and the paper will be sent  
accordingly.

## TO VICTIMS OF RHEUMATISM IN ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a safe, speedy and permanent cure are within the reach  
of every sufferer, by using

**RICHARDS' REMEDY!**  
For Inflammation, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or erratic in their character. Composed  
wholly of VEGETABLE EXTRACTS, it exterminates the  
complaint without injuring the constitution. None but the  
TORTURED SUFFERERS who have been relieved from their  
agony by the operation of this remedy, can realize the  
ecstasy which the mere cessation of long-continued tor-  
ment imports. Sleep returns, strength returns, health and  
hope return to the pain-worn and debilitated patient, and  
once cured, nothing but the grossest imprudence can lead  
to a relapse. The confidence with which these statements  
are made to the public, is the result of many years' ex-  
perience. The reputation of mere pain-  
killers is not what a SWEETENING MEDICINE,  
which produces, year after year, in all cases, the same ben-  
eficial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!  
3v8-1m

## New Mining Advertisements.

De Soto Gold and Silver Mining Company.—  
Location of Works: Star District, Humboldt County,  
State of Nevada.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twentieth day of  
April, 1867, an assessment of sixty cents per share was  
levied upon the capital stock of said Company, payable  
immediately, in United States gold and silver coin, to the  
Secretary, at the Office of the Company, No. 58 Exchange  
Building, northwest corner of Montgomery and Washington  
streets, San Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the first day of June, 1867, shall be deemed delin-  
quent, and will be duly advertised for sale at public auc-  
tion, and unless payment shall be made before, will be  
sold on Wednesday, the nineteenth day of June, 1867, to pay  
the delinquent assessment, together with costs of advertis-  
ing and expenses of sale. By order of the Board of Trustees,  
JOHN M. BURNETT, Secretary.

Office, No. 63 Exchange Building, northwest corner of  
Montgomery and Washington streets, San Francisco, Cal.  
ap27

Gold Quarry Company. Location of Works:

Placer County, State of California.

Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment levied on the  
21st day of March, 1867, the several amounts set opposite  
the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
George Atwood.....	14	100	\$2 00 10
James Freeborn.....	18	50	1 00 00

And in accordance with law, and an order of the Board of  
Trustees, made on the 21st day of March, 1867, so many  
shares of each parcel of said stock as may be necessary,  
will be sold at public auction, by Cobb & Sinton, auction-  
eers, at the office of the Company, 706 Montgomery street,  
(Room No. 4) San Francisco, Cal., on Monday, the thir-  
teenth day of May, 1867, at the hour of 11 o'clock, A. M.  
of said day, to pay said delinquent assessment thereon,  
together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary.  
Office Room No. 4, 706 Montgomery street, San Fran-  
cisco, Cal. ap27

Hanson Copper Mining Company. Location:

Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the fourth (4th) day  
of March, 1867, an assessment of ten cents (10c) per  
share was levied upon the capital stock of said Company,  
payable immediately in United States gold and silver coin,  
to the Secretary, 609 Market street, San Francisco, Cal.

Any stock upon which said assessment shall remain  
unpaid on the fourth (4th) day of April, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made before,  
will be sold on Monday, the twenty-second day of April,  
1867, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees,  
S. S. SWEET, Secretary.

Office, No. 609 Market street, San Francisco, Cal. ap27

POSTPONEMENT.—The day for deemed stock delinquent on  
the above assessment is hereby postponed until the third day  
of May, 1867, and the sale thereof until Monday, the twen-  
tieth day of May, 1867. By order of the Board of Trustees,  
JOHN HANSCOM, Secretary.

Office, at the Alamo Iron Works, Fremont street, between  
Howard and Folsom, San Francisco. ap27

X. X. L. Gold and Silver Mining Company.—Loca-

tion: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-fifth day of  
April, 1867, an assessment of three dollars (\$3) per share was  
levied upon the capital stock of said Company, payable  
immediately in United States gold and silver coin, to the  
Secretary, at his office, in the store of J. G. Dodge & Co.,  
418 and 420 Clay street, San Francisco, Cal., or to John G.  
Slattery, at Silver Mountain, Del Norte County, Cal.

Any stock upon which said assessment shall remain un-  
paid on the twenty-fifth (25th) day of May, 1867, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Monday, the tenth day of June, 1867, to pay  
the delinquent assessment, together with costs of advertis-  
ing and expenses of sale. By order of the Board of Trustees,  
S. R. STEVENS, Secretary.

Office, 418 and 420 Clay street. ap27

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal., on the twenty-third day of April, 1867, at the hour of 12 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

M. G. ELMORE, Secretary.  
Office, 302 Montgomery street, San Francisco. op27

**Postponement.**—The above sale is hereby postponed until Wednesday, the twenty-second day of May, 1867, at the same hour and place. By order of the Board of Trustees.

M. G. ELMORE, Secretary.  
Office, 302 Montgomery street, San Francisco. op27

**Chilpaneca Mining Company—District of Ures, Sonora, Mexico.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of March, 1867, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, 518 California street, up stairs, San Francisco, Cal.  
Any stock upon which said assessment shall remain unpaid on the third day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twelfth day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.  
Office, 518 California street, San Francisco. ap13

**Illegal Supplemental Advertising.**—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

**Camargo Gold and Silver Mining Company, Lander County, Nevada.**

Notice.—There are delinquent upon the following described stock, an account of assessment levied on the 14th day of February, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen any time in operation. 3v141r

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to better them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the  
PACIFIC FOUNDRY,  
San Francisco.

## REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

## PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action, Repeaters, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4 to 6 inch barrel; Rifle Games—an entirely new Arm—having a range and accuracy equal to a rifle, and most perfect design. All the new models for sale very low.

12v13tr

ALBERT E. CRANE.

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850  
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.**  
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the line of crushing. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Pulon Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county: **RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.**

**JAMES BRODIE, Esq., San Francisco.**—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, **R. P. JOHNSON,** Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the owners have chosen to sue for the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22, 1865.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street,  
San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C.

The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat, it does not draw the air for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed and insure a large supply of water.

Rights for the use or manufacture of this Valve, are for sale by **V. CUSHING,** 120 Front street, San Francisco.

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public. See illustration and description of this pump published every other week in this paper. 14v14qrtr

Notice to Miners,  
Well-Borers and Water Companies.

**M. PRAO** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. Also, manufacture Mississippi Stoves, of the latest Improved patterns, for vessels of all classes. Also, Ship Plumbing done.

**M. PRAO,**

HUNTER'S  
Eureka Amalgamator!

**FOR WORKING THE SANDS AS THEY PASS FROM** the battery. The coarse particles of sand are reduced to pass through a No. 6 screen that would pass through a No. 5 in the battery; the fine flour gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The machine is four feet eight inches square on the bottom, and covered with iron dies 1 1/2 inches thick by four inches wide, extending across the bottom with alternate strips of wood on end of the same width. The rubbers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between rubbers. The box is also lined with copper to the bottom and all the loose ends, by eccentricity giving an oscillating motion, and the rubbers are suspended on iron hangers, and adjusted by set screws.

One-fourth of a horse-power is sufficient to run one machine of ten tone capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from **W. M. WATT, Esq., of the Eureka Mill,** will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is from rock that pays \$40 per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I have ever seen. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it; but the best recommendation I can give it is that I want four more. Will you please go to the Vulcan Foundry and order them for me."

On the 1st of April I had ordered for two more, for the Pittsburg Company at Nevada City.

The price for a Machine with rubbers made, and dies and wood set to the bottom and all the loose ends, is \$275. The weight is about one ton with cast iron box; but to save freight, the box can be made of boiler iron, saving 500 pounds weight.

Orders sent to the Vulcan Foundry, the Union Foundry, or the Union Foundry, First street, will be promptly attended to.

**ANDREW HUNTER, Patentee.**  
P. S.—Patent allowed.

HUNTER'S  
IMPROVED CONCENTRATOR.

**THE INVENTOR OF THE ABOVE RECENTLY IMPROVED** Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the value of the concentrates, and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs. 14v14

## To Quartz Miners and Others.

## NOTICE!

**I WISH TO CALL YOUR ATTENTION TO A PULVERIZER** of my own invention, which I have called the **HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject examine it. Patent applied for. 1v14 3m **JAMES HITCHENS.**

STRONG & CO'S  
CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Millers, Rolling Shoes and Reverse action. Millmen and others are invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by **G. W. STRONG, Assayer.**

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay by mail, Fargo & Co's tariff on papers sent by express. If connecting express in the interior make additional charges, subscribers must themselves settle the same.

## Important Facts.

A French gardener having occasion a few years since, to paint the woodwork in the interior of his greenhouse, took the occasion to make a trial of the theory of the absorption of heat by black color, hoping that he might thereby improve the vigor and growth of his plants. His paint was composed chiefly of the waste coal tar from a gas manufactory.

He was delighted to witness a marked improvement in the growth of every plant which was trailed up against anything covered with this paint. In one instance a grape vine which had been sensibly decaying for two years, and which he was about to remove, acquired a marked increase of health and vigor.

He was also not more surprised and gratified at another striking fact developed—that the spiders, caterpillars and snails, which had before seriously annoyed him, entirely disappeared from every part of the woodwork covered with this paint; and very few, indeed, were afterward seen in any part of the greenhouse. The fruits, as well as plants, were also sensibly improved, both within and without the greenhouse, wherever they were grown within the influence of this covering. Similar experiments, it is reported, have since been tried in quite a number of the vineyards of the Gironde, with equally favorable results.

These facts strongly remind us of what is said of the "pitch grounds of Tenerife." This pitch or brea once formed a thin superficial covering for a large tract of ground, outside of the main deposit, which has now become thoroughly mixed with the soil, and is said to constitute the most fertile portion of the island. The locality is covered with cottages and gardens, and vegetation thrives there with great luxuriance. The "pitch lake" is situated on an elevation reached by a gentle ascent of a mile and a quarter from the sea. It is from the running off or wearing away of this lake that these pitch grounds have been formed at a lower level than the lake itself. Everywhere on the confines of this lake, vegetation, both natural and artificial, is abundant and vigorous, and pine-apples grown on this tract are said to be remarkably good.

This fact may not be without importance to our gardeners and vineyard growers. Has any one paid any attention to the natural growth of vegetation in the vicinity of the brea deposits of this State, wherever these deposits are but sparsely mixed with a soil at all naturally favorable to plant growth? Of course an excess of such material cannot but be injurious. Would not such experiments as may be suggested by the above, be worth trying and reporting? Has any one any practical knowledge in the matter, or will some one make an experimental trial, and report the same to this or their local journals? Our contemporaries in the brea districts, might possibly do a service to some of their readers by making mention of the above, or correcting any erroneous impressions which may be created by these remarks.

**DAVIS' EXCELSIOR KNIFE CLEANER**, for polishing table and carving knives, is a rotary machine, of English invention, constructed with a drum, having the size and form of an ordinary grindstone, and like it turned with a crank. Brushes are placed within the instrument, face to face, by means of which, in connection with a given quantity of flour of emery, expressly prepared for the purpose, the knife is effectually cleaned in a very few moments after its insertion. All interested may call at W. Frank & Co's, 406 Battery street, where, besides many other curiosities, may also be seen some very life-like looking animals, formed of a species of German clay, we believe, and a novelty of interest to those who have never witnessed anything of the kind.

**CYRUS B. INGHAM**, editor of the Tama City Union, Iowa, wishes to know the address of the person who recently sent him a copy of the Press.

**OLNEY & Co., Auctioneers and Real Estate Agents,** attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 313 Montgomery street, San Francisco. 1010

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**Hobbs' Grinder, Amalgamator and Concentrator,** combined and all within the same pan, can now be seen in operation at the Franklin Foundry, Fremont street, between Mission and Howard. Sulphurates perfectly concentrated within thirty minutes on the rim of the pan near the surface of the water—the process of grinding and amalgamating going on at the same time. All the inventor asks is an examination of his new Concentrator, believing it to be the best and quickest ever yet invented. 11v14-1f

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Plac and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *rose gold*—thus restoring them to their original usefulness and beauty. 15v14-1f

Call and examine the work. Finest quality of artificial work also manufactured. 15v14-1f

## Gaston's Screw Grinder and Amalgamator

— IS —  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 15v14qr

### PACIFIC POWDER MILL

COMPANY'S

### BLASTING POWDER!

MANUFACTURED

### IN MARIN COUNTY,

CALIFORNIA.

FOR SALE BY

### HAYWARD, COLEMAN & CO.,

AGENTS,

414 Front Street, San Francisco. 3v14-1m

### PACIFIC BILLIARD TOURNAMENT.

Open to all Players on the Pacific Coast.

A GRAND BILLIARD TOURNAMENT FOR THE CHAMPIONSHIP of the Pacific Coast will take place at Congress Hall, San Francisco, On the 16th, 17th and 18th days of May next.

First Prize—A splendid GOLD MOUNTED CUE and the CHAMPIONSHIP. There will also be four other prizes in cash, ranging from one hundred dollars up.

The New York American Billiard Players' Association's rules will be strictly adhered to in this contest. A Committee of Billiard Players will be appointed to regulate the details of the Tournament. Gentlemen wishing to participate in the contest will please communicate with STRAHLE & HUGHES, 15v14-1m 557 Market street, San Francisco.

### Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Measles, Swollen Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 524 Sacramento street, opposite Whit Clker House, San Francisco. 10v14-1y

### Just Published.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS of the Nervous System and Reproductive Organs, to be had by addressing and enclosing twenty-five cents, postage stamps to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v13-1y

### HEALTH! HEALTH!

No more Typhoid, or other Deadly Fevers.

Contracted by inhaling the Noxious Gases of Sewers and Cesspools.

### Taylor's Stench Traps and Garbage Baskets,

And promote the health, comfort and cleanliness of your family. For description see Mining and Scientific Press, April 6, 1897. Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v14qr

### SAN FRANCISCO BRUSH FACTORY, BRUSHES,

At lower prices than cost of Eastern Importation. Brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root fiber; also, Stucco Brushes from the same material. ## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO., 9v14-6ml5p Corner of Front and Market streets.

PLUMAS COUNTY MAP—Prof. J. D. Whitney, State Geologist, abandons the contract, announced some time since, by which he was to furnish a map of Plumas county for \$3,000; and has sent a communication to the Board of Supervisors of that county, to the effect that, after considering the matter in all its bearings, he has come to the conclusion that it is the duty of the Geological Survey to furnish all the counties of the State with maps free of charge to the counties themselves.

**Allen's Lung Balsam.**

The following letter, from Dr. A. L. Scoville, who has had many years experience in the medicine business, and with Lung Remedies, will give the afflicted still more assurance that the sure remedy is found at last; and the consumptive should lose no time in commencing the use of Allen's Lung Balsam:

CINCINNATI, January 9, 1864.

Gents—I make the following statement from a perfect conviction and knowledge of the benefits of Allen's Lung Balsam, in curing the most deep-seated Pulmonary Consumption. I have witnessed its effects on the young and the old, and I can truly say that it is by far the best expectorant remedy with which I am acquainted. For Coughs, and all the early stages of Lung Complaints, I believe it to be a certain cure, and if every family would keep it by them, ready to administer upon the first appearance of disease about the lungs, there would be very few cases of fatal consumption! It causes the phlegm and matter to raise, without irritating those delicate organs (the lungs) and without producing constipation of the bowels. It also gives strength to the system, stops the night-sweats, and changes all the morbid secretions to a healthy state.

Yours, respectfully, A. L. SCOVILLE.  
Consumptives, do not despair, because all the remedies that you have tried have failed, but try this Great Remedy. Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.

Sold by all Medicine dealers everywhere. 14v14-1m

FIG. 1.

FIG. 2.

**FOR GOLD AND SILVER ORES,**

With Revolving Stirrers and Rotary Distributor.

Can be seen in operation at the Union Foundry, First St., San Francisco.

**Directions for Operating Hendy's Concentrators:**

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—Set the Pan, A, level, by its inner rim.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

**References:**

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL.....	Grass Valley, Nevada County.
GOLD HILL MILL.....	Grass Valley, Nevada County.
CONEY & BIGELOW MILL.....	Jackson, Amador County.
SPRING HILL MILL.....	Amador, Amador County.
GOLDEN GATE MILL.....	Volcano, Amador County.

GOLDEN RULE MILL.....	Stewart Flat, Placer County.
BENTON MILL.....	Bear Valley, Mariposa County.
LOUISIANA MILL.....	Coulterville, Mariposa County.
RAWHIDE RANCH MILL.....	Jameson, Tuolumne County.
PEOPLE'S MILL.....	Alleghany, Sierra County.
TYRON & CO'S MILL.....	Prescott, Arizona.
WOOLSEY & CO'S MILL.....	Prescott, Arizona.
NOYES & CO'S MILL.....	Prescott, Arizona.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
TRIUNFO G. & S. M. CO.....	Lower California.

And in use in many other parts of this coast.

For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

**Remarks:**

Many Concentrators have been gotten up in this city. Some of these claim foreign origin; others are of home production. The sonorous Greek names, with which some of these have been dignified, ought, it would seem, to have entitled them to a better fate than that which has befallen them. A large proportion of these machines are now "numbered among the things that were." A few were still-born; never having had an existence except in the shape of advertisements and cuts, prematurely prepared by their too confident projectors. For one of these it was claimed, with a grand flourish of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order or in the way." Unfortunately, however, although it had a reasonable supply of legs, it obstinately refused to run. Amputation failed to remedy the defect, and it now lies forgotten among a heap of old iron,—a mechanical abortion.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works, for 1866, pages 51, 53.

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus:

**Pacific Mail Steamship Co's  
STEAMSHIPS FOR  
NEW YORK, JAPAN AND CHINA.**

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days

On the 10th, 18th and 30th of each month that has 31 days

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding, when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:

April 30th—CONSTITUTION..... Capt. W. F. Laplage,

Connecting with the RISING STAR, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three months' delay requisite in transacting business through Eastern agencies.

**THE ELEMENTS OF COMPOSITION, BELLES-LETTRES, AND ORATORY.**—This work, by Prof. Augustus Layres, is to appear in three parts, or books. The first part, the "Elements of Composition," is just published, and we have been complimented with a copy by the author.

It is a work which deserves more than a mere passing notice. It treats an old subject in a new way. It makes an agreeable pastime of what has been by many deemed an irksome task. Although not a treatise upon grammar, it has to do with matters which are the very end and aim of grammar; and in making of these matters an attractive study, it has a tendency to render that also more attractive. Grammar is generally voted, at school, the driest of all studies, and is shirked accordingly. Disgusted with the interminable string of "rules" which he is compelled to commit to memory, the student rarely troubles himself to look into their real use; and so they are gradually forgotten, as the school-days pass by, and the word-jingle, which alone made them at one time familiar, ceases. It is true that many such students acquire the habit of speaking and writing with correctness—and even elegance—but when this is the case it is due to a naturally accurate ear, together with the having cultivated a correct literary taste by constant familiarity with the choicest literary works, rather than to anything which could be called a knowledge of grammar. Such men, however faultless their own literary productions may be, if asked the reason why they would arrange a sentence thus instead of so, would be entirely at fault. Although knowing instinctively that it was correct, they would be utterly unable to explain it to another; and would consequently be not only unfit to act as teachers, but would often be subjected to a feeling of mortification by that inability.

There is no question that the grand stumbling-block in the way of the student of grammar, has been the faulty manner in which the subject has been presented to him. Prof. Layres, in the work under consideration, has "changed all that." He plunges at once "in *medias res*." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather we should say neatly and skillfully dissects it—displays one by

one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject. Here is the whole matter in a nut-shell. This is *analysis and synthesis*. This is the only way to teach anything—viz., by examples. In order, for instance, to become acquainted with the mechanism of a watch, a man must take it to pieces, note the structure and office of each of its several parts, and then recombining them into a single whole, observe the effect. What progress would the student of anatomy make in that science if his professor should confine himself to the enunciation of general propositions, unaided by demonstrations with platens, mannikin, or cadaver? Nothing but a vague indefiniteness would be the result of his teachings.

Prof. Layres proceeds in his course from the simple to the compound; and the student who follows him becomes a grammarian before he knows it. By the time he has completed the careful perusal of this little book, he is competent not only to analyze or to construct the most complex sentences, but to arrange such sentences together in the most effective manner for the proper treatment of a literary topic.

The work, beginning with the sentence, presupposes an acquaintance with words, and with the rudiments of grammar. In order to complete the contemplated school textbook series, it seems to us that an elementary work on grammar, or at least a preliminary chapter, introducing the pupil to the various "parts of speech," with their changes and powers, would be desirable.

Prof. Layres, who is a foreigner by birth, expresses, in his preface, the utmost admiration for the system of instruction in vogue in the public schools of the United States; and remarks that he has prepared this work especially with a view to its use in these schools. It will, however, be useful for study and reference, not only to the young student, but to the advocate, the clergyman, and the author. We understand that its adoption in the schools of Sacramento city has already been decided upon.

An Appendix, containing remarks on punctuation, and the use of capital letters, closes the work. It is published by A. Roman & Co., and was printed at the book and job office of the MINING AND SCIENTIFIC PRESS.

**QUICK WORK.**—The largest of the new steam fire engines was lying at the repairing shop, all in pieces, at the moment when the alarm was given for the Cosmopolitan fire. Mr. Hayes, the head mechanical engineer of the department took the matter in hand, and in three-quarters of an hour from the time of screwing up the first nut she was throwing two large streams upon the burning hotel.

**THE SUBMARINE CABLE** between Florida and Cuba will be in working order by June 1st, unless accident prevents.

## Pickering's Patent Regulator.

We present this week a form of steam engine regulator, that is perhaps new to some of our readers. It is, however, in extensive use in the Eastern States and has been adopted during the past two years by several of our own prominent machine shops, a number of quartz mills, flour mills, fac-

tories, and on board of the ocean screw steamers Ajax and California, running on this coast.

Propeller engines are very apt to run irregularly when the ship is in a rough sea. This is termed "racing" by engineers, and it causes much loss of power, besides being dangerous to the safety of the engine. To maintain a uniform speed in such cases is very difficult. The ship rising and falling so rapidly requires instantaneous action on the part of the regulator. We are assured that this regulator has accomplished the purpose in the most perfect manner.

It is the invention of Mr. Pickering, of the firm of Pickering & Davis, New York, and patented October, 1862, and October, 1865. The patentee has recently gone to Paris, and it is expected this will be one of the American inventions that will challenge all Europe. It is marked by great simplicity, and having no joint it is extremely sensitive, as well as durable, besides being the cheapest economical governor that is made. We append a description:

As may be seen by the engraving, the ends

of the springs are secured to flanges, the lower of which, resting on steel washers, and having a collar to prevent its rising, is capable of only a rotary motion, while the upper one, being at liberty to move lengthwise as well as to rotate, receives its rotary motion from the lower one, through the springs, and communicates any lateral motion, due to the varying centrifugal force, immediately to the balanced valve to which the governor is firmly secured by the bracket, a part of which forms a long bearing for the horizontal spindle, which communicates motion from the power to the governor through the miter gearing, which is used for the smaller sizes, while for the larger ones, when required to run perfectly noiseless, we use frictional gearing, which is giving great satisfaction.

The object of this invention is to obtain the requisite centripetal force and stiffness without making the springs too heavy, and consists in the peculiar construction of the spring, and also in the shape of the curve given it, by the manner in which the ends and middle portion are secured, so as to keep those parts, at all times, parallel with the center of motion. By this arrangement we can use steel so thin, that all liability to break, or tendency to "set," or lose its elasticity, is dispensed with; while, by using two or more strips together, we obtain the required centripetal force. The peculiar curve obtained by this arrangement is called a double cyma, by the use of which, two or more strips, firmly secured together, will work freely, without any tendency to huckle, or interfere with each other's action.

The various sizes of these regulators can be seen by calling on David Stoddard, at 114 Beale street, San Francisco, who is the agent of the patentee, and keeps a full assortment on hand. Mr. S. is also agent for Giffard's Injectors, which have received some new and valuable improvements at the hands of American manufacturers.

**THE SAN FRANCISCO PORT SOCIETY.**—We have received the proceedings of the seventh anniversary of the San Francisco Port Society, containing the chaplain's report, constitution, list of officers and members of the Society, and a list of contributions to the building fund of the new Seamen's Bethel, a brief illustrated description of which we gave last week. The officers of this Society are as follows: President, Ira P. Rankin; Vice President, R. B. Swain; Secretary, J. Rowell; Treasurers, David N. Hawley; Trustees: W. R. Stowell, D. N. Hawley, J. T. Dean, Wm. C. Hinckley, John T. McLean, Oliver Eldridge, E. P. Flint, J. Rowell and Capt. J. F. Stewart. This Association is accomplishing much good in ameliorating the condition and elevating the moral standard of the seamen of this port. Rev. J. Rowell, as pastor and an officer, seems to be untiring in his efforts.

**LARGE FORGING.**—The largest shaft ever forged in this city, was that recently made at the Pacific Forge Works for the steamship *Amsrica*, which came in on her last trip from San Juan del Sur with one wheel, and being made whole, sailed again on the 26th ult., with two. The broken shaft was built up with scrap iron faggots and welded under a trip-hammer. These works, now on Mission creek, are about to be removed to the Potrero, and greatly enlarged.

## Communications.

In this Department we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## The Action of Electricity on Metallic Solutions.

BY EDWARD PIQUE.

EDITORS PRESS:—Some time ago you were kind enough to insert an article of mine in your valuable paper, where I proved, as plainly as possible, that in galvanic batteries the chemical action is not the origin of the electricity produced, although such an opinion has been expressed by some of the most learned men of this age. At present, I intend to correct another erroneous opinion connected with this matter which has been put forth by several eminent natural philosophers.

They assume that in a watery solution of most of the metallic salts, the water is decomposed, and that the hydrogen resulting from the decomposition of the water acts on the metallic oxide in solution, whereby the metal is reduced and deposited on the negative electrode. Such an idea is simply absurd, for the reason that the decomposition of water requires electricity of a much higher power than the decomposition of most of the metallic solutions. For instance, if we form a weak galvanic apparatus by immersing a plate of copper and one of amalgamated zinc in dilute sulphuric acid, and conduct the electricity so produced into a glass of water, by means of two copper plates connected with each of the above metals, the water will not be decomposed. If we now dissolve some blue vitriol in the water contained in the latter glass, the copper of the solution will immediately be reduced and deposited on the negative electrode, while the positive copper plate will, in the same measure, be dissolved. We do not see any appearance of hydrogen gas, since the current is not strong enough to decompose the water. If we now increase the electric tension by connecting a number of zinc and copper pairs, or by using a more powerful galvanic apparatus, as, for instance, a porous cell arrangement, with platinum and nitric acid on one side, and amalgamated zinc on the other, the water will be decomposed simultaneously with the sulphate of copper in solution, hydrogen will be evolved at the negative plate, and copper will appear at the same place; but it will adhere only lightly to the plate, and drop off as soon as a larger quantity be formed. Neither will it have the beautiful metallic appearance, as in the first instance; but it will represent a dark, spongy mass, in consequence of the hydrogen disintegrating the metallic deposit, and also because most likely a partial oxidation of the copper has taken place.

What I have said about the sulphate of copper applies equally to many other metallic solutions. I do not see any necessity to assume that the hydrogen of the decomposed water acts as a reducing agent on the metallic compound in solution, since electricity in itself will separate the constituents of the compound; and it is a great deal simpler to say, that if we treat, for instance, a solution of chloride of copper in the way above stated, the copper will be attracted by the negative plate, and the liberated chlorine will dissolve a part of the positive copper plate. A similar explanation will answer for any other solution of metals. That the water acts only as a dissolving medium, and is by no means a necessary assistant to the decomposition of metallic compounds, is very simply proved by the fact that most of the chlorides, in a fused state, are very readily decomposed by the galvanic battery, and the metal obtained in a pure state. Even some of the most electro-positive metals (as, for instance, the metal magnesium) have been produced in quantities by this method.

To throw a little more light on my first

statement, I wish to refer the reader to the law that operates when a mixed solution of several metals is submitted to the action of a galvanic battery. The different metals in solution are connected with their negative partners; as, for instance, with oxygen, chlorine, etc., with different degrees of intensity. Consequently the electricity will likewise have to be of different tension or power to effect a separation of the different combinations. Water, being an oxide, has to follow the same regulation. A very feeble degree of electricity is sufficient to decompose chloride of gold or platinum, a little stronger for nitrate of silver, still stronger for sulphate of copper. Then follow, in succession, the sulphates of tin, cadmium, zinc, nickel, iron, manganese, and the salts of the alkalis. Every one, in the order mentioned, requires a more powerful degree of electricity for its decomposition than the preceding ones. The oxide of hydrogen, or water, requires a considerable tension of electricity for that purpose, more so than most of the other oxides.

If we now, for instance, mix the solutions of sulphate of copper and sulphate of zinc, and apply electricity of just sufficient tension to decompose the sulphate of copper, the result will be that nothing but a deposit of copper will appear on the negative plate, and all the zinc will remain in the solution; but if we apply electricity of more power or tension, so that according to the size of the immersed metallic surface, more electricity will pass than is required to decompose the sulphate of copper, a part of the zinc will at the same time be reduced, and we shall obtain on the negative plate a coat of brass, which is an alloy of both these metals.

A similar explanation will apply to a solution of sulphate of copper alone, or of any other single metallic compound in water. A weak degree of electricity will reduce only the metal, but electricity of a higher tension will decompose the water at the same time, and in the latter case the hydrogen of the decomposed water will cause the spongy appearance of the reduced metal, which is often destitute of a metallic appearance. Even some metals are deposited from their solutions as oxides only when acted on by currents from large batteries and yet are deposited in a brilliant metallic form if submitted to the action of a weak electric current. Of these, nickel is an example. A solution of its chloride or sulphate will yield a gelatinous green oxide when a powerful electric current is introduced; but when the current is weak, it will form a crust of metallic nickel on the negative electrode, often of a silvery luster.

This fact is nothing new. It is well known and mentioned by all the writers on this subject; but, strange to say, not one of those natural philosophers ever attempted to give a reason for this phenomenon. I will try to give my opinion to the best of my knowledge.

Certainly no one will pretend that the hydrogen which, simultaneously with the metal, appears at the negative plate, could cause the oxidation of the metal, as the hydrogen has just the contrary effect.

I will, to explain this phenomenon, first refer to the law that governs the communication of electricity. If a body is charged with one kind of free electricity, and comes in immediate contact with another body, particularly if they are both good conductors, the electrified body will give up a part of its own electricity, and, communicating it to the other body, will charge the latter with the same kind of electricity as itself possesses. If, on the contrary, these two bodies do not touch each other immediately, but are separated by a small layer of a non-conducting or badly conducting substance, induction will come into play, and, as every electrician knows, in this case the electrified body will not charge the other body with the same kind of electricity as its own, but with just the contrary kind. Now, in the above case, the hydrogen plays the part of the insulator that separates the metal intending to encrust the negative plate from the latter, and, consequently, puts the reduced metal in a highly positive and finely divided state, both of which conditions are favorable to a rapid oxidation.

As an example of the protecting influence of the negative plate on metallic deposits, I will mention only the interesting case of the metal ammonium, which, when reduced from a solution of its chloride by a weak battery in contact with a little quicksilver, will form an amalgam. This spongy ammoniacal amalgam, although it cannot be kept immersed in water even for a few instants without the formation of ammonia, yet as long as it is connected with the negative electrode of the battery, it may be preserved, without change, from days or weeks. The instant the connection with the battery is broken, a mass of this amalgam as large as

a walnut, appears to vanish in a few seconds, torrents of minute bubbles being given off, and a scarcely appreciable quantity of mercury being left on the wire. Or, again closing the connection with the battery, decomposition recommences, and the amalgam is reproduced. (See *Bird's Natural Philosophy*.)

This fact proves plain enough that the amalgam, as long as it is in connection with the negative electrode, participates in the electro-negative character of the latter, which not only enables it to resist the oxidizing influence of the water, but even to continue the reduction of the metal ammonium from the solution on its own surface.

[Written for the Mining and Scientific Press.]

## The Reese River Country and its Mines.

BY A. J. HOWE.

NUMBER TWO.

[Continued from Page 242.]

Twenty-two miles further up Reese River valley, following the western base of the Toiyabe Range, we come to San Pedro cañon, in

WASHINGTON DISTRICT.

Here the inhabitants have thus far employed themselves to better advantage, in raising turnips and cabbages, than mining. There are, however, mines in this district well worthy the attention of capitalists; among them, lodes of argentiferous galena that might be made very profitable, under proper management, by the smelting process. One in particular, the "St. Elena," has attained considerable note. This has been managed by Señor Alvarez, a Spaniard, who seems to have been poorly calculated to manage a work of such magnitude without the adequate means. He has expended a fortune on this mine, and, I understand, is now at the East endeavoring to bring capital to bear on it. May his success be as boundless as his enterprise. Besides the immense amount of lead contained in the ore, it yields upwards of \$100 per ton in silver.

In the summer of 1863, Messrs. Hersherperger & Co. brought a 10-stamp mill into this district; a situation was selected above the town of Washington, and five of the stamps put in operation that year; but for some unexplained reason, the miners failed to supply it with ore, and latterly it has been used as a sawmill, turning out considerable quantities of lumber from the white pines that grow high up the mountain sides above the mill.

There are many really good mines in Washington district; but if the miners cannot, or will not develop them, they must be content to have them lie idle and comparatively unnoticed, till the wide field of choice now open to capitalists is narrowed down. Among the mines here worthy of notice, I will mention a group of parallel lodes, owned by Emanuel San Pedro, an intelligent and hospitable native of Spain. The series is admirably situated for tunneling, with a fine stream of water running past the mouth of the tunnel, and surrounded by an almost exhaustless supply of the best known fuel. This group is in a narrow belt of granite. The lodes are from twenty to fifty feet distant from each other, and are large and moderately rich as far as developed; which development amounts to but little. San Pedro having exhausted his means elsewhere, is now waiting with admirable fortitude for "something to turn up." I venture nothing in engaging that he will entertain in a hospitable manner, and give any stray capitalist a "good lay."

The town of Washington, situated in San Pedro Cañon, with a beautiful stream of clear water coursing down from the highest peaks of the Toiyabe Range, through its main street, might, without much stretch of imagination, be called a romantic locality. It has evidently seen livelier days than at present; still many of the pioneers stick, with the tenacity of barnacles, confident that their day is dawning. In no portion of the Toiyabe Range has Nature been more

lavish in her bounteous supply of timber, than here.

We will now take the reader over the line into Nye county, turning our backs to Lander for the present, the boundary running in a northeast and southwest direction, through the town of Washington. Crossing the sage-covered plain in a westerly direction five miles, we reach

REESE RIVER.

Here we find this far-famed stream in all its glory, entirely hidden as we approach by the luxuriant rye grass, wild currant and willows. It is rapid at this point and about six yards wide, its eddies and overhanging, grass-covered borders affording excellent hiding places for the beautifully speckled brook trout that sport in its waters. The volume of water here is greater than at any other place along its course, while only fifteen miles below, in the vicinity of Covington's ranch, it sinks for several miles, reappearing near Willson's ranch. One of Austin's enterprising merchants will erect a flouring mill here during the coming summer, in anticipation of which the ranchmen along the river, and elsewhere throughout the agricultural portions of this region, are busy putting in large crops of wheat and barley—last year's experimental crops having proved that Central Nevada is capable of producing its own bread; aye, and of furnishing a surplus for the desert region lying to the south.

We are now on the stage road leading from Mammoth and Lone to Austin; the distance by it back to Austin is thirty-six miles, being somewhat nearer than by the road we have traveled. This road follows the Reese River Valley in a north and south course over forty-five miles. Our course is now due south, up the river for eighteen miles to Bramber's Station. Here the broad valley of Reese River begins to contract; the Toiyabe and Shoshone ranges approach till, eighteen miles above, a low divide only separates them, forming an accessible pass to the great arid plains on the south.

Opposite Bramber's Station, and for some distance below, the peaks in the Toiyabe Range reach the altitude at which the white and yellow pine flourish. A close observer can readily distinguish this line of altitude at the distance of eighteen or twenty miles. The foot-hills and mountain sides two-thirds of the way up are covered with the dense, dark-green foliage of the nut pine; then comes a narrow belt destitute of timber; lastly, the northern slopes of the highest peaks will be covered with clumps of the majestic white pine, towering above their dwarfish kin below. At Bramber's our road turns to the west, passing over the Shoshone Range by easy grade, six miles, where, near the western base, is situated Lone City, in Union District.

[To be Continued.]

LATEST NEWS FROM ARIZONA.—Late news from Hardyville report the miners in the San Francisco, Sacramento and Waba Yuma Districts all busy at work, sinking shafts, running tunnels into their ledges, and getting out ore for the mills. The mill at Hardyville (of ten stamps) is running day and night. The ore crushed is very rich, which encourages the miners to push the developments of their rich lodes.

Mr. F. H. Adams, with a party of miners, starts for the Sacramento District to develop the Antietam lode, which is very rich in copper, as also in gold and silver. The mine is owned by the Specie Basis M. Co., of Philadelphia. The same company also owns a number of other lodes in that District, which they will soon develop. The miners all feel greatly relieved since the arrival of two companies of cavalry at Fort Mohave, which are after the red-skins wherever seen. Provisions of all kinds are plenty at Hardyville and vicinity. Late news from Williams' Fork confirms all previous reports of the rich copper mines now being worked by several companies at that place. Stages now arrived regularly with the United States mails.

SCORPIONS IN DURANGO, MEXICO, are of an especially venomous species. The government, in the time of the Viceroy, offered a bounty of six cents each. The consequence was that the people went into the business of raising them. The increase became so great that the bounty has been gradually reduced, until now it is only half a cent. But even at this price it pays to breed them.

## Mechanical.

COMPARATIVE RESISTING POWERS OF A HOLLOW SPHERE AND A HOLLOW CYLINDER. Mr. Zera Colburn, in "Engineering Facts and Figures," says that "The strength of a hollow sphere to resist internal pressure is exactly twice that of a hollow cylinder of the same diameter, material and thickness."

\* \* \* "The place in which rupture, if it happen at all, will take place in a hollow sphere, is the largest plane that can be drawn through it, and the metal resisting the strain tending to cause rupture, is the whole section of metal bounding the plane."

\* \* \* "In a hollow cylinder, the area upon which the greatest pressure tending to cause rupture will be exerted, is that represented by the product of the length into the diameter of the cylinder."

The ends of a hollow cylinder, the common form of a boiler, add nothing to the strength of the cylindrical part, when a rupture begins in that part, as it usually does. In boilers where great strength is desirable, without regard to cost or convenience of form, the cylindrical shape should be used; and since such a shape gives twice the strength of the ordinary form, may there not be economy in a more general adoption of such a mode of construction. Mr. Colburn says that a cast iron sphere, seven feet in diameter and seven-sixteenths of an inch in thickness, is as strong as an ordinary wrought iron cylinder boiler, of the same internal capacity—the great difference between the tensile strength of cast and wrought iron, in a boiler of the dimensions named, being fully compensated by the difference of resisting strength between the spherical and cylindrical forms.

In comparing cast with wrought iron, it may not be inopportune to allude to the fact that the capacity of the former for the transmission of heat is much greater than the latter. Hence cast iron, if presented in a safe form, is better adapted to making steam boilers than wrought iron. The superiority of the Harrison (cast iron) over the ordinary cylinder or wrought iron boiler, in point of safety and the economical production of steam, is due to the facts above set forth. In fact, the only thing which has hitherto prevented that boiler from coming into general use, is the difficulty of keeping steam-tight the innumerable joints which are inseparable from its mode of construction.

WIRE DIRECT FROM THE BLOOM.—Messrs. Johnson & Nephew, of Mauchester, England, wire manufacturers, are now producing wire by a continuous process of rolling and drawing; so that there is no break in the work from the time the bloom leaves the furnace until it is wound up in the form of wire on a reel. Sieman's gas furnace is used by them, and blooms are used weighing 100 pounds each. The blooms are conveyed from the furnace directly to a series of rollers, which are geared so as to give an increasing velocity proportioned to the various stages of elongation, until the bloom is all converted into wire.

SAWING IRON.—The saw is now used with great success in England, in cutting out locomotive frame plates and other such like work. An endless band-saw is used, half an inch wide, one 32d of an inch thick, and run at a rate of about 200 feet a minute; it is lubricated with soap, and cuts 3/4-inch plates at the rate of one inch feed per minute. It works four or five hours without sharpening. The finest angles are said to be cut with a precision never attained with the old methods.

IRON MANUFACTURE IN PRUSSIA.—The value of steel manufactured in Prussia in 1850, amounted to only \$300,000; in ten years thereafter it rose to \$1,250,000, and now amounts to nearly \$9,000,000 per annum. The manufacture of pig, cast and wrought iron has increased in about the same ratio, and now amounts to about \$50,000,000 per annum.

OILS AND BEARINGS.—We observe an announcement from Europe that the higher American oils contain a considerable amount of bisulphide of carbon, which may have something to do with the injurious effect upon bearings and journals. This "injurious effect" is chiefly due to the presence of acid introduced in the refining process, and not subsequently washed out as thoroughly as it should be. Lubricating oil should be prepared without the aid of acids—it is so prepared by Messrs. White & Co., and also by Stott & Co., both of this city. The time is not distant when the use of acids and alkalis in refining coal oil will be entirely done away with, as an expensive and useless process.

THE TEMPERING OF STEEL TUBES.—A correspondent of the *Scientific American* writes to that paper as follows: "In your issue of Feb. 16th, I notice an article from correspondent 'V,' in which he gives the manner of tempering steel tools for various purposes, stating the color that the steel assumes. Now I think his rule will not hold good in all cases, as I find that the coloring depends altogether upon the amount of polish given to the steel after it is hardened. So far as my experience goes, I find that the higher the polish the higher the color should be left.

For instance, take a piece of steel and harden it, then give it a bright polish, and for a wood-cutting tool, it only requires drawing to a pale straw-yellow, while the other side which is not polished at all, will be deep blue. I think there can be no definite rule given for all to go by, unless we can have a standard rule for the polish to be given to the hardened surface. Such a rule I think is impossible, and the best way is for each steel worker to go by his own experience. It is a fact among steel workers that when one goes into another's shop and sees the color that he leaves his tools, when he tries to imitate the other, his tools will not stand, although he may give them the same shade of color. The reason is, I think, one gives the tool a higher polish than the other. If any of your correspondents can give a standard rule to polish by, so that every worker can give the same polish, I should like to hear from them and so would others.

FRICTION.—The friction of iron journals in brass boxes, with a film of good oil interposed, has been found in some cases to be as little as one-sixteenth of the weight. Ordinarily it is about one-thirtieth of the weight, while if the surfaces are wiped dry from oil it is about one-tenth. The friction of metals upon each other becomes a larger proportion of the pressure as the pressure is increased. The friction of wrought-iron on wrought-iron, at a pressure of 32½ pounds per square inch, was found by Mr. G. Rennie to be 14 of the pressure. At 4½ cwt. per square inch, it was 400 of the pressure. Two thin metal plates, their inner faces roughened like those of a vise, and held together by screws, form a cheap, strong and convenient fastening for driving straps. If the strap stretch, the screws (which pass between the ends of and not through the strap) have only to be loosened, the ends of the leather cut shorter, and clamped anew.

Spur-gearing has been driven at a surface speed of nearly a mile a minute, a three-foot gear making 500 turns. At this speed the motion, with good gearing, is very smooth.—*London Engineering*.

STRENGTH OF IRON UNDER DIFFERENT CONDITIONS.—During some experiments made by the U. S. Board of Ordnance, under the direction of Major Wade, it was ascertained that a gun, burst with hydrostatic pressure, showed only about one-third of the strength exhibited under direct tensile strain in a testing machine. Among many similar results, a gun burst with a pressure of 9,000 pounds per square inch of resisting metal, whereas a sample bar of the same iron bore 27,350 pounds per square inch before breaking.

THE BERLIN WARE, so celebrated for its power of withstanding heat, acids and alkalis, according to Dingler's *Polytechnic Journal*, is composed of 45 parts kaolin, 37½ alumina and 16½ feldspar. The enamel is composed of 42 parts silica, 33 kaolin, 13 unburnt gypsum and 12 of Berlin ware, as above described.

PLATINUM-STEEL ALLOY.—The proportions of platinum that appear to improve steel for cutting instruments are from one to three per cent; 1.5 per cent is thought to be about the best which can be thus employed.

## Scientific Miscellany.

THE SPOTS ON THE SUN.—A DISCOVERY. The astronomers at the Kew Observatory (England) after a careful and close examination have discovered a most remarkable coincidence between the appearance, size and varying position of the spots on the sun, and the revolutions of the planets. When Jupiter and Venus are both in conjunction the action is observed to be much more marked than when they are in opposition.

The nature of the influence exerted, in an opinion expressed by Prof. Tate, is "that the properties in a body, especially those with respect to heat and light, may be influenced by the neighborhood of a large body;" and an influence of this kind would naturally be most powerful upon a body possessed of a very high temperature, like the sun; a very small increment of heat causing a mass of liquid to assume a gaseous form, and *vice versa*. So that the heat withdrawn by Jupiter and Venus from the side exposed towards them, might be sufficient to cause a copious condensation of gases which might have a visible effect directly, or produce mechanical changes by means of altered refraction varying the distribution of a great amount of heat. This conjectural explanation will be held subject to the results of a more extended comparison of facts.

THE LOSS OF LIGHT BY GLASS SHADES. Carefully conducted experiments, with the photometer, have fully proved that there is a very great loss of light by the use of any kind of shade. Even the cleanest and purest crystal plate reduces the intensity of gas or coal oil light fully six per cent. The following comparative table has been carefully prepared:

Description of Shade.	Loss of Light.
The cleanest glass.	6.1 per cent.
Crystal plate.	8.5 "
Crystal glass (common).	10.5 "
Ground glass.	29.4 "
Smooth opal.	52.8 "
Ground opal.	55.8 "
Ground opal, ornamented with painted figures.	73.9 "

The screen through which the evolutions of light are propagated, serves to diminish first the rapidity of the vibrations requisite to produce the most refrangible rays, and in proportion as the transparency of the screen is diminished, by any cause, this arrest becomes more and more complete. The use of screens, it will thus be seen, should form an important matter for consideration in lighting public halls, etc. Much economy may be employed in their choice.

HOW TO CRYSTALLIZE CARBON.—Take a long thin leaf of gold, and wind round it a helix formed of a similar tin leaf, so that the covered and uncovered portions of the gold shall be about equal. Now, with the metallic couple thus formed, a spiral is made, which, if plunged into the sulphide of carbon, will slowly decompose the sulphide—the sulphur combining with the tin, while the liberated carbon will be precipitated in crystals.

THE KNOWN ASTEROIDS, or minor planets revolving between the orbits of Mars and Jupiter, now number ninety-one. The ninety-ninth was discovered by Dr. Luther, of Bilk, near Dusseldorf, on the first of October last, and the ninety-first and last at the Marseilles Observatory, at about the same time.

DYNAMIC FORCE.—A remarkable discovery has been made by Mr. C. Siemens, which demonstrates, in a striking manner, the convertibility of dynamic into electrical force. A bar of soft iron enveloped with copper wire, not transversely, but in the direction of its length, if inoculated in the slightest degree with magnetism, and then made to rotate rapidly, generates electricity to such a degree that wire is melted by the currents, and effects are produced which have hitherto required the aid of an electro-magnet.

LIGHT AND HYDROGEN.—It is a suggestive statement, if correct, that an atmosphere of hydrogen supplies to plants the want of light, enabling them to grow green in the dark. The fact that they are nearly colorless, when grown in the dark and in common atmospheric air, is well known.

The annual production of diamonds in the world is set down at \$4,500,000 in value.

ELECTRICAL STATE OF THE EARTH'S CRUST.—M. Matteucci has discovered that if the surface of the earth be connected at different altitudes by a conducting wire, a constant current of electricity will flow from the lower to the higher point of contact, the intensity of which will be in proportion to the difference in altitude of the two points. Geological formations and atmospheric changes will of course modify this action.

The following paragraph may be read with interest in connection with the above:

The attempt to establish telegraphic communication with underground workings at the Pewabic Mine, Lake Superior, has disclosed a curious difficulty. Since the discovery that by placing each end of a telegraph wire in the ground the circuit is made as completely as when two wires are used, but one wire has been employed, and the telegraph successfully worked. The wire used in the Pewabic Mine is a 1-16th copper wire, wound in the same manner as water-proof fuse, the wire taking the place of the powder. After the line was set up, to the surprise of all, no signals could be transmitted, and though the operator made a thorough examination and tried numberless experiments, it could not be made to "give one little sign of life." The end of the wire underground was put in a hole drilled in the rock and tamped in; a bed of earth was afterwards made, and lastly a pool of water tried, all to no effect. The circuit was broken at as short a distance as 30 feet below surface, while above ground it works well enough. Will some of our scientific readers offer an explanation?

METEORITES.—Prof. C. W. Shepard, of Amherst College, has one of the finest meteorological collections in the world. He has made their constitution a subject of careful study, in the progress of which he has divided them into three classes, as follows: The first class, "Litholites," or stony, derived from the Greek word *lithos*, a stone, embraces three sub-classes. 1. Eucritic, or distinct earthy individuals; crystalline. 2. Disortic or indistinct earthy individuals. 3. Anthracite, or black. The second class, "Lithosiderites," or mixed stone and iron, from the Greek words *lithos* and *sideros*, iron, embraces two sub-classes. 1. Pleiotholitic, or more than half stony. 2. Meiotholitic, or less than half stony. The third class, "Siderites," consisting chiefly of iron, includes two sub-classes. 1. Psatharic, or brittle. 2. Apsatharic, or tough. Each of these sub-classes is subdivided into several orders, which cannot be here enumerated. Under these orders he has arranged 211 varieties, stating when and where each was found. Under the head of meteoric minerals he enumerates eighteen species which are supposed to have existed in meteorites anterior to their arrival within our atmosphere.

THEORY OF STEEL.—M. H. Caron, in a communication made to the French Academy of Sciences, attributes the combination of iron with carbon or other elements of the same family by which tempered steel is formed, to the sudden shrinking of the mass, which he considers as analogous to the instantaneous compression produced by hammering. In illustration of this point, he found that by hammering a bar of iron heated to a bright redness, on an anvil covered with powdered charcoal, the face of the bar in contact with the charcoal was, in spots, converted into steel, and capable of resisting the file. His researches also confirm the results of previous experiments, that the density of steel is decreased by tempering. In one specimen, after thirty successive temperings, the density was reduced from 7.817 to 7.743.

A NEW COMET was discovered on the 22d of January, by M. Stephan, director of the observatory at Marseilles. It possesses a well defined nucleus, with a tail in line with the direction in which it is seen from the earth. Its appearance at this time is regarded as highly opportune for an examination of its physical characteristics, by spectrum analysis, which examination will be made on its nearest approach to the earth.

THE SUPPOSED LUNAR VOLCANO.—We noticed some weeks since some supposed changes in the appearance of a volcanic crater in the moon, from which it has been inferred by European astronomers that the volcano must be, at least at times, in a state of activity. *Per contra*, Mr. Rutherford, on this side of the Atlantic, has lately examined all his photographs of the moon (which, it is well known, far surpass in size as well as minuteness of detail any European pictures), with especial reference to this subject, and he avers that he is unable to detect any change in the brightness of the locality in question.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**AN IMPROVED GATE FASTENER.**—The Contra Costa *Gazette* describes a new "Gate Fastener" recently invented by Mr. George McCoy, of Antioch, in that county. The invention consists in the application of a V spring similar to that of a gun lock, to the bolt, which by action of the spring is operated so quickly that it will infallibly shoot into the fastening mortise, however quickly the gate may be swung, and cannot be drawn out except by direct pressure upon the opening lever, which is so arranged as to be reached from on horseback or on foot. In the model inspected, the gate was hung to swing both ways, and throw with any degree of force either way, never failed to fasten upon the instant shoot of the bolt when opposite the mortise. This improvement is little, if any, more costly than the ordinary fastenings, which are generally of small account and not to be depended on.

**A NEW QUARTZ MILL INVENTION.**—The Helena (Montana) *Gazette* describes a new quartz mill invention recently devised by some party, name not given, in that place. A model of the same was on exhibition at the house of Tutt & Donnell. The stamps have additional force imparted to them by wooden springs, and strike the quartz obliquely, thus giving a grinding as well as crushing force. The device is said to be very simple and cheap, and is soon to be put to a practical test. The "wooden spring" arrangement is an old idea, never yet, however, found practicable. How the obliquely strike is given, is not stated. If it can be done without unusual wear to the machinery, it might be economical.

**A FIRE INDICATOR.**—Among the recent improvements having in view the safety of life and property from fire, an ingenious device by Mr. Charles Dian, of Montreal, Canada, is especially mentioned. It consists of a small dial, something like a clock face, hung up in a sleeping apartment or sitting room, from which wires extend to the various rooms of the building, and all connected with one or more alarm bells. The instant any one of these wires is unduly heated an alarm is given by the bells, and the dials—there may be any number of them—point out the exact locality of the fire. Such an invention must be valuable for hotels and large buildings. They are being introduced into some large buildings in Canada, and the Board of Fire Underwriters of New York have officially certified to the striking merit of the invention, strongly urging its general introduction in that city.

**WARMING CITY RAILROAD CARS.**—A plan has been suggested in New York for warming city railroad cars, an object very desirable in the northern and eastern cities for the health and comfort of passengers. The plan is as follows: Metallic or other tubes, of sufficient size and weight, are filled with heated sand at the depot before the cars start, and are laid into chambers under the floor or seats, and out of the way and out of sight. These give a comfortable amount of heat during the direct and return trip, when the sand is again renewed, and the comfort and health of the passengers, drivers and conductors are thus secured while on the cars, for the pipes extend out under the driver's feet and back to where the conductor stands. This is no theoretic plan, but a working device in use on the railways in Northern Germany.

**LIGHTING FIRES BY GAS.**—An invention has recently been made in England called the "gas fire-igniter," which is intended as a substitute for wood and paper in lighting fires. A row of three gas-burners is fitted on below and behind the grate bottom, with a tap at one side, so that when a fire is wanted the gas is lit, and the flame passing amongst the coals sets fire to them without the aid of wood or paper. In summer, water can be boiled by the gas alone, as by an ordinary gas fire.

**SALE OF THE NEW ALMADEN MINE.**—A deed conveying this mine was recently made by the Philadelphia trustees to certain parties in New York. The consideration expressed was \$3,500,000. It was filed for record in San José. The transfer does not involve a change of ownership of the mine, but is made in order to escape the heavy taxes upon incorporations in Pennsylvania.

**METALLIC SIGNS.**—We paid a visit some few days since, to the workshop of Andrade & Patterson, on the corner of Montgomery and Pine streets, for the purpose of seeing the *modus operandi* of manufacturing the new and elegant style of signs being introduced here by them, which they call metallic signs. Many of our readers have no doubt noticed some of these attractive embellishments on many of the stores on Montgomery and other leading streets. The material of which these signs are made is thick sheet zinc, which the proprietors import from the East expressly for the purpose. The metal is first cut to the required size, and then nicely flattened and cleaned off. The design is then made upon paper, and traced upon the zinc; the next thing is to outline, as it is called; this is done by means of a sharp steel chisel and hammer, and the shape of the letters or design of the sign, is cut in about one-sixteenth of an inch deep; it is then given into the hands of another workman, who with a different kind of chisel cuts out the body of the letters; after this it is trimmed up, and any fancy ornament or border is engraved. It is then given into the hands of a third person to be polished. This is a long and laborious process; but the sign is finally turned out as bright as a mirror. The next thing is the hending, (for most of these signs are circular), which is followed by the process of filling in; that is, filling the letters, which have been cut out level with the surface of the metal. For this purpose they manufacture a kind of cement, which is soft and black, but which after a short time becomes quite hard. The sign is then screwed to a wooden frame, with brass screws, which form quite a pretty contrast to the brightly polished zinc. This completes the manufacture of the most attractive, and most durable kind of sign ever introduced; it is attractive because of its brightness, and we are assured by the manufacturers that one of these signs cannot be reasonably worn out in an ordinary lifetime.

This description of signs was first introduced in New York some six years ago, and so well have they been appreciated, and so liberally patronized, that there is scarcely a store on Broadway without one or more of them; in fact there are at the present time some thirty men continually employed there in this business. We inquired the prices and find them to be very reasonable, not greatly in advance of an ordinary painted sign, while they are assuredly much more attractive and ten times as durable.

We were glad to see both partners were actively engaged in the mechanical part of the trade. They are also making door plates of this kind of metal which look very nice, and cost only about one-half the price of silver-plated ones.

Previous to the arrival of Mr. Andrade in this city, many persons so felt the necessity of these signs that several were imported from New York, and many will no doubt also be pleased to learn that this has now become an established business in this city, and join us in the hope that Messrs. Andrade & Patterson may meet with that success which their enterprise undoubtedly merits.

**ANOTHER OF THE LUCKY ONES.**—The Denver *Gazette* says that young "Jim Whitlatch" is in this city, en route for the Paris Exposition. He is owner of the most famous mine in Montana—the Whitlatch Union, which is yielding an average of \$8,000 per week. He declares that he intends to take to the Exposition the first \$100,000 turned out by the mine. Young Whitlatch was at one time the owner of a good silver mine in Nevada.

**BUSSEY'S NEW SAFE LOCK.**—Amador County has semi-officially adopted this new combination lock, by having one with four bolts attached to the treasury vault. The County Treasurer speaks emphatically in favor of this California invention, after testing its value by practical use. A correspondent writes that Mr. Bussey sold all the locks he had on hand, during his late visit to that county.

**HUMBOLDT OIL WELLS.**—The Irwin Davis well, Mattole, was abandoned at the depth of 1,450 feet.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board  
SAN FRANCISCO, SATURDAY MORNING,  
May 4, 1887.  
CITY STOCKS.

City shares have been exceedingly inactive, and sales at the Board embrace a limited amount of business in this class of securities. Much of this inactivity may be attributed to the continued upward tendency of the entire list of mining stocks. Spring Valley Water sold at \$67 per share. Cal. Steam Nav. Co. sold at 71 per cent. early in the week, and at the close 70 is bid. North Beach and Mission R. R. realized \$49.50 per share. Pacific Ins. Co. sold at \$125 to \$126. The San Francisco Gas Co. paid its usual monthly dividend of  $\frac{1}{2}$  per cent. on the first inst., amounting to \$30,000. We quote this stock at \$66.50 bid and \$67.50 asked.

We learn from the Secretary that the Front Street, Mission and Ocean Railroad Company held a meeting on Tuesday evening, at which it was unanimously agreed to issue additional stock sufficient to pay their debts. Some \$21,000 worth of the new stock was subscribed at this meeting, and stockholders will have an opportunity to take seven additional shares to every ten they now own, if subscribed within twenty days.

The sales in the Stock and Exchange Board during the month of April have been as follows: April, 1884, \$2,649,072; April, 1885, \$4,339,032; April, 1886, \$4,038,096; April, 1887, \$5,593,016.

## MINING SHARE MARKET.

The mining share market has been characterized by a marked degree of animation during the past week, and great firmness, at an advance, prevails in most shares at the close.

**HALE & NORCROSS**—continues out of the market. We are informed that this mine is looking better as the different breasts are being opened. Air is now forced into the south breasts on the 780 foot level, and they are now raising up to connect with the 700 foot level for the purpose of obtaining ventilation. They are also running a drift on the 700 foot level, directed to this point, to connect with the "raise" below.

**SAVAGE**—has advanced rapidly over our previous quotations, opening at \$2,825, improving to \$3,060, then selling at \$3,030, rising to \$3,280, and closing yesterday at \$3,270. During the week ending April 27th, 1,806 tons of ore were taken from the mine, showing an assay value of \$80,907, equal to \$44.79 per ton. The yield of the previous week gave an assay value of \$32.32 per ton. The upper works produced 55 tons, sixth station 264 tons, seventh station 677 tons, and Curtis' shaft 810 tons. For several weeks past ore has been taken from the seventh station breasts through the Curtis shaft, showing that the above amount did not entirely come from the south mine.

Since our last reference suitable mine timber has been obtained, and work has been resumed in the various breasts. The Curtis shaft is now over sixty feet in depth from the third or new station, and is said to be in very favorable ground for sinking. We learn that the drifts from the third station are making good progress toward the lead. It is confidently stated that this company will declare a dividend of \$150 per foot out of the earnings of last month, besides carrying forward a large surplus. In the United States District Court, at Carson, Nevada, on the 2d inst., the case of Thornburgh vs The Savage Company, after a two days' trial, was decided by the jury in favor of the defendants.

**CROWN POINT**—has exhibited great firmness under a sharp advance, rapidly improving from \$1,460 to \$1,700, receding to \$1,645, jumping to \$2,000, and closing yesterday at \$1,950 b. 3. Some 626 tons of ore were extracted from the mine during the week ending April 26th—42 tons of which came from the new development in the 500-foot level. We learn that slow progress is being made in opening north and south on the east vein, owing to the hardness of the rock; however, the mine is said to look very favorable at this point.

**YELLOW JACKET**—has been in the market to a considerable extent, advancing from

\$1,335 to \$1,600, then realizing \$1,520 to \$1,575, and closing at \$1,675. Information has been received by telegram from the Gold Hill office of this company that they had \$205,000 in hand on the first instant.

**CHOLLAR POTOSI**—has been exceedingly active since our last reference, at greatly enhanced figures, jumping from \$500 to \$662, and closing at \$635, seller 30. The Blue Wing station is said to be looking much better in the "raise," and breasting is being continued to the north in fire ore. The second winze in this station is down fifty feet, and is also said to be in good ore. We understand that the old Santa Fe continues good in going north. Another winze is being sunk from this station to the lower Santa Fe, which has attained a depth of about 30 feet, and is reported to be in good ore. The body of ore in the north end of the first station, from the new shaft, is said to have increased in size, but as yet shows no improvement in quality. The shipments of ore to custom mills, during the week ending April 27th, have been as follows: From the Potosi mine, 2,999 tons; new shaft, 468 tons. Total, 3,467 tons—previous week, 2,400 tons. This company at present gives employment to 273 men at the mine, and requires fourteen mills for the reduction of its ores.

**GOULD & CURRY**—advanced from \$500 to \$590, receded to \$535@520, improved to \$550, and closed yesterday at \$500. We learn that the bottom of the Bonner shaft is in better ground, and that work at that point is progressing more rapidly. The south drift from the fifth station is still in hard ground. The north-east drift on the fourth station has been commenced, and they continue to work to the east on the sixth station. The bullion received at the San Francisco office in the month of April amounted to \$63,130.19.

**OPHIR**—improved from \$382.50 to \$460, declined to \$410, rallied to \$475, and closed at \$420. The tenth station drift south is in 130 feet, and the north drift, on the same level, is in 30 feet. The first cross-cut is now being run through the ledge.

**ALPHA**—sold within a range of \$425 to \$460. BELCHER has been in active demand under a very marked advance, improving from \$320 to \$405, then selling at \$350@340, and closing at \$440.

**IMPERIAL**—opened at \$272.50, rose to \$280, receded to \$274, and closed yesterday at \$277.50. The bullion received at the office in this city up to the 23d ult. amounted to upwards of \$49,000. The Imperial-Empire shaft is timbered to the depth of 872 feet.

**EMPIRE**—is not included in the list of stocks which have lately exhibited such a rapid appreciation, selling within a range of \$193 to \$202, and at the close obtaining \$194.

**CONFIDENCE**—sold to a large extent, opening at \$59, seller 30, rising to \$70, then selling at \$58 to \$67.50, and closing at \$66.50. GOLD HILL Q. M. Co. sold at \$180@165, and KENTUCK at \$200 per share.

**BULLION**—changed hands more freely than for some time past, advancing from \$50 to \$82.50, falling to \$60@40, and at the close realizing \$55. OVERMAN rose from \$42 to \$49, declined to \$43, and closed at \$48. SIERRA NEVADA advanced from \$14 to \$20, then sold at \$15, and at the close \$15 is asked. The latest accounts from this mine are to the 20th of April. The water in the shaft has been reduced 500 feet, and they then commenced to erect the plunger pump to drain the levels. It is expected that the water will all be drained out before the 1st of June, and thenceforward the work will progress on the ledge struck last fall. The twenty-eighth assessment is being paid up, and will become delinquent on the 14th inst. The sale of delinquent stock will take place on the 30th inst.

**EXCHEQUER**—advanced from \$8 to \$18, receded to \$9, then sold at \$12.50, seller 3, and closed yesterday at \$12. DANEY sold at \$9@12. GOLDEN RULE (Cal.) sold at \$16, seller 30, per share.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,895,823.

## Allen's Lung Balsam.

Remarkable cure of the daughter of Robert Lawrence, Esq.

NEWYORK, Ky., June 1, 1887.—Gents:—I will give you a statement of the wonderful medicinal properties of ALLEN'S LUNG BALSAM. My daughter was attacked with a cold, which settled on her lungs. A severe cough was the consequence, which so harassed her that she became much reduced. She had great pains in her side and breast, attended with cold chills and night sweats. She raised more than a pint of matter a day. Finally her lungs became ulcerated, her hands and feet were cold and clammy as death. Her physician, having failed to give any permanent relief, said that he could not do anything more for her; that she must soon die. At this time I procured Allen's Lung Balsam, which caused her to raise large quantities of matter and phlegm. When this was expectorated, her appetite and strength gained rapidly, and her cough in a short time ceased, and now she is a most extraordinary trophy of the medicinal properties of Allen's Lung Balsam.

Respectfully yours, ROBERT LAWRENCE.  
Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.  
Sold by all Medicine Dealers everywhere. 1874-1m

## List of Officers of Corporations and Mining Companies.

(PUBLISHED IN THE FIRST ISSUE OF EACH MONTH)

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

**ALAMEDA COAL CO.**—January 14th. Trustees: B. Dean, B. Eugene Anger, A. Wapler, W. B. Agard and P. McMahon. President, B. Dean; Secretary, A. Wapler; Treasurer, B. Eugene Anger; Treasurer, A. T. Ladd. Office, 704 Sansome street.

**DANEY G. & S. M. CO.**—April 15th. Trustees: W. W. Palmer, H. A. Fox, W. B. Johnston, E. J. Pringle, H. L. Henschel, A. Pavillier and Jas. Paterson. President, W. W. Palmer; Vice President, H. A. Fox; Secretary, A. Noell. Office, 607 Washington street.

**FRANCO AMERICANA S. M. CO.**—April 16th. Trustees: J. Landsberger, H. Schulmann, J. Regensburger, B. Broderson, Jno. Stock. President, J. Regensburger; Secretary, Angelo Cohn; Treasurer, H. Schulmann; Superintendent, F. Ernst. Office, 652 Washington street.

**HOPE GRAVEL M. CO.**—April 23d. Trustees: W. A. Bateman, C. W. Ham, B. C. Howard, F. Madge and Lewis Teese, Jr. President, Lewis Teese, Jr.; Secretary, David Wilder; Treasurer, B. C. Howard; Superintendent, H. J. Paine; Foreman at the mine, Sam'l Locke. Office, 529 Clay street.

**NEW IDRIA M. CO.**—April 29th. Trustees: Wm. E. Barron, Thomas Bell, D. O. Mills, Joseph Barron and W. H. L. Barnes. President, Wm. E. Barron; Secretary, John S. Brodie; Treasurer, Bank of California; Superintendent, Wm. Neely Thompson. Office, at Barron & Co's.

**NEW INCORPORATIONS.**—The following companies have filed their certificates of incorporation since our last issue:

April 28th.—Fillmore Homestead Association. Capital stock, \$16,000, in 40 shares of \$400 each. Trustees: T. S. Russell, W. H. Saery, C. J. Ladd, John A. Nye, Wm. Francy, J. L. Jones and Wm. Hollis.

April 28th.—California Manufacturing and Commercial Company. Place of operations, Nicaragua. Capital stock, \$150,000, divided into 1,500 shares of \$100 each. Directors in San Francisco: R. F. Ryan, Daniel Murphy, Capt. J. H. Blethen, John McKee, Peter Ward, Arthur Quinn, and Felix O'Rourke. In Nicaragua: Henry Gottell, Esq., Rivas; Padre Acosta, San Jose; Victor Mestayer, Granada; Yidefonso Vivas, Granada; Don Chico Munoz, Leon; A. H. Maduro & Co., Leon; Ex-President, Thos. Martinez, Managua.

May 2d.—Philadelphia Slide Gold Mining Company. Location of mine, El Dorado Co. Capital stock, \$300,000; 3,000 shares of \$100 each. Trustees, S. Klein, H. Greenwood, E. R. Hawley, A. H. Bailly and E. H. Taft.

**PACIFIC STRAW WORKS.**—We took occasion, a few days since, to visit the Pacific Straw Works, No. 335 Bush street, one of the principal objects of which is the renovation of hats and bonnets that have grown out of fashion or become somewhat "worse for the wear." The number of the different kinds of articles, "made as good as new" in a single month, will sometimes reach 8,000; giving employment to about forty persons at fair wages. Almost everything required to carry forward the work, even to the blocks of plaster, wood and iron, is made in the establishment. It has three distinct departments, one for renovating, another for coloring, and a third for the manufacture of the hat and bonnet frames, with elevators for carrying the work from one story to another as needed. The steps in the process of the operation may be stated in about the following order: The different articles in their dilapidated or soiled condition are received, usually from the milliners, and then numbered, picked clean of the threads and linings, mended, altered to the prevailing style of fashion, washed, bleached and dried in the sun; then stiffened or sized, again dried, steamed, blocked into proper shape, pressed and finished for delivery. The process of making the frames, which are of wire and buckram imported from New York, is not quite so tedious. They are cut to the desired size, softened in water, put under iron forms heated with gas and then pressed to the proper form by machinery. A large amount of this class of work is done here, and in much better style than similar work from the East.

## MINING SHAREHOLDERS' DIRECTORY

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location, Amount and Date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

**MINING MACHINERY.**—We are informed that three of J. H. Stewart's Hinge Mullers have been recently sent to the interior—one to the Oriental mill and mine at Wisconsin Hill, Placer county—the others to the Pyramid mine near Rose Spring, White Oak township, El Dorado county, for the new quartz mill of Angel Brothers, which is now nearly completed. A very good idea as to the construction and merits of these new mullers, can be formed from the cut and description found in another column, or they can be seen at the Miners' Foundry, where they are being built.

**EXPLOSION OF A RETORT.**—At the Excelsior mill between Silver City and Dayton, Nevada, a retort containing 400 pounds of amalgam exploded the other day, scattering the precious stuff in every direction. The heavy iron cylinder was blown to atoms. Strange to say, the superintendent, who was near, was only slightly injured. The cause of the explosion was undoubtedly the clogging of the pipe.

**BLAKE'S PATENT**  
**QUARTZ CRUSHER.**  
**CAUTION!**  
The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.  
This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.  
All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.  
Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified in advance. Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of April 25th: Five tons of Tarshish ore was taken this week to Nevada to be worked, with the firm belief that the yield will be at least \$500 per ton. In crossing the ledge, 17 ft. has been made without reaching the west wall.

The results obtained in the I. X. L. have not been flattering. The company are now satisfied that they must attain a greater depth before they can expect anything permanent; and now contemplate extending the tunnel some 500 ft. further into the mountain, with hopes of striking another chimney.

## Amador County.

From the *Ledger* of April 27th: The Oneida is daily improving in richness and quantity of rock. Last Monday, Mr. Reichling cast a brick for them worth \$9,000, the result of 11 days' work of the mill.

Coney & Bigelow have commenced the erection of their chlorination works.

Letter from Volcano: The Italian or Sorocco mine is paying well. So also the Paugh. The Vaughn is yielding large dividends to Fogus & Co. The Golden Gate is being worked with satisfactory results. Prospects of the Belding and Pioneer mines are flattering. There are no less than 70 different companies engaged in placer mining in the basin and immediate neighborhood, and that too with success.

## Calaveras County.

From the San Andreas *Register* of April 27th: The excitement at Cat Camp has reached fever heat. It is represented that the ground, for an area of 10 miles square, is very rich.

Letter to same from "Jumperville, Mokelumne Rich Gulch," April 20th, says: The mill that was announced as being nearly completed more than two months ago, and when scarcely any steps had been taken, is now approaching completion. It is expected to be finished sometime in May. I understand that another quartz mill will be built during the approaching summer.

From the Copperopolis *Courier* of same date: Messrs. Cronise & Co., late purchasers of the big reservoir in Salt Spring Valley, and also the Hughes quartz mine, at Quail Hill, have had a survey made and are about to let a contract for digging a ditch, running from the big reservoir to the Hughes mine. The ditch will be eleven miles in length and of capacity to carry 200 in. of water, and will be completed within 65 days. By building reservoirs along the line of the ditch, it will supply the Gopher placer mining with water. This district has never been worked to any great extent on account of a scarcity of water. This company are about to build a 20-stamp mill at the Hughes mine, which will be erected with the utmost despatch.

## El Dorado County.

From the Placerville *Courier* of April 27th: A day or two ago Mr. Raphet, a merchant at Newtown, brought into our office a nugget of solid gold weighing 36 ounces, taken out of the claim of two Germans known as Joe and Chris, between the North and South Forks of Weber creek.

Mr. Shepherd has shown us another beautiful specimen of rock from his claim at Poverty Point.

From the *Democrat* of same date: We receive favorable accounts from Fairplay, Newtown, Kelsey, Georgetown, Spanish Dry Diggings and the mines in our immediate neighborhood. A large belt of rich-mining ground some miles east of Placerville is lying idle for want of water. Among the rich claims of the county is Hugh B. Newell's, at Gold Hill, near Coloma. Out of 22 days' washing he cleaned up, a few days ago, \$3,800. In the vicinity of his claim is the rich White Eagle quartz lode, owned by Charles Grainer, and several other ledges, which show fine prospects.

## Fresno County.

From the Mariposa *Mail* of April 27th: Nat Harbert and Wm. Miller returned from the Fresno on Monday evening. The ledge they are working is seven feet in width at the depth of 15 ft., and the rock not only shows gold but prospects rich. Messrs. Harbert, Miller and Rogers are the owners, and intend building a mill this summer.

## Kern County.

Messrs. Thomas & Taylor, superintendents of Harrold's mine (better known as the Burning Moscow), in the new El Dorado Dist., have made a clean-up of average rock, which yielded, by the arastra process, \$24.85 per ton. They have gone down 75 ft., at which depth the ledge is from three

and a half to four ft. wide. An 8-stamp mill will be in operation within 30 days. There is an inexhaustible supply of water, and the expense of working the rock will not exceed \$5 per ton.

The property of the Kern River Gold and Silver Mining Co. is advertised for sale by the Sheriff.

## Mariposa County.

From the *Gazette* of April 20th: On the left bank of the Middle Fork of the Merced, Messrs. Berdow, Snediker & Hennessy have struck a vein which shows free gold in almost every fragment. They are prospecting it in Stanley's arastra. The same party struck a vein on the right bank also, which worked, in Ferguson's mill, \$40 per ton. . . . Ferguson & Co. are crushing rock that averages \$100 per ton as fast as their eight-stamp mill will do it. . . . At Ned's Gulch, W. Coleman & Co. are running their arastra on rock which averages \$150 per ton. . . . Jenkins & Co. are crushing at the Mount Hope mill. Their rock is uncommonly rich, but base metals abound. . . . A. G. Black, Sheehan and Jerry Davis are developing a magnificent vein, 16 ft. wide, at the Burnell cabin. It pays \$20 per ton in a little old rotten mill. . . . On Bull creek, Messrs. Lamh & Co. have a small but very rich vein. . . . The Crown Lead mill has been idle for two years.

From the Mariposa *Mail* of April 27th: It is said that work will be resumed immediately on the Princeton mine, with a force of eight or ten hands, to pump the water out, and that in the course of six weeks or two months the mine will be in a condition to employ a full force and set the mills to running as formerly. Mr. Brumagim, the manager of the Grant, will start the quartz mill at Bear Valley as soon as it can be repaired. The 50-stamp mill at Mariposa, too, will soon commence running with half the present number of stamps.

A Hunter's Valley letter to the Stockton *Independent* says the Princeton mine has 400 ft. of water in it; also, that the great dam on the Merced river was washed away during the past winter. The machinery is idle and rusted. . . . La Victoire copper mine in this valley, which was considered enormously rich a couple of years since, has of late been thought to have "petered out." It is owned principally by Messrs. Pioche & Gagliardo, of San Francisco, and may yet prove as rich as it formerly promised. On visiting the place yesterday we found the smelting works in operation.

The Potts mine is about a mile from the La Victoire, and is undoubtedly one of the richest quartz claims in the State. The company now has a shaft down 150 ft., and the rock will average \$40 per ton. They are now preparing to build a new mill of 12 stamps, which will be completed in a few months. La Grange is and will remain dead until the dam on the Tuolumne is rebuilt. A Mr. Thurston is working the only claim near the town that can be supplied with water. He had the means to bring in a ditch of his own. He is doing well.

## Nevada County.

From the *Transcript* of April 25th: On the Skyhigh claim, Deer Creek, the tunnel is in 150 ft., and they have just commenced drifting. In blasting in the tunnel five car loads of gravel were thrown out, which was prospected and yielded one and a half ozs. of gold worth \$17.75 per oz. The company will clean up in a few days.

Same of 27th: Oshorn & Co., at Scott's Flat, after a run of eight days, cleaned up \$400 last week. There are more mines being worked at Scott's Flat than for many years.

The French Co. and Black Bros., owning gravel claims at French Corral, have arranged to run a bedrock tunnel from a ravine near the South Yuba river, for the purpose of opening the claims at Kate Hays' Flat.

Same of 30th: Rich gravel was struck in the gravel claims of Evans & Co., in Birchville Dist. The bed of it is 200 ft. wide. It is estimated that they will take out \$20,000 the next run.

The Granite Tunnel Co., Liberty Hill, Birchville Dist., has commenced washing again.

The miners at Rocky Bar, near Washington, were getting out excellent pay until yesterday, when they were compelled to stop on account of the rise of the Yuba river from the melting of snow. Root, Fish & Co., after one week's work with five men, cleaned up about \$800. Parties are engaged in sinking for the old river bed about Washington, and at a place called Kino Bar very flattering prospects have been found. At Canal Bar, there is every prospect that a number of companies will reach the channel this summer. The river at this point is quite high, and it is probable the miners will not be able to resume work for three or four weeks.

From same of May 1st: Several companies are engaged in washing at Hunt's Hill. The prospects are said to be flattering. The Eastern Co's mill is running, and the Goug-eye will start up in a day or two. The latter company has been engaged in washing off the surface gravel during the winter, and has uncovered a large quantity of rich looking cement, which will give the mill plenty of work.

From the *Gazette* of April 27th: We learn that the claims of Johnson & Co., near Blue Tent, have lately been sold to Bond and others for \$9,000. The claims of Cuddeback and others, near by, have also been sold.

From the Grass Valley *National* of April 22d: This morning, the Lone Jack mine, No. 2, otherwise known as the Homeward Bound, situated about a mile and a half from Grass Valley, was sold to David Hunter and others for a large sum. The purchasers will proceed immediately to erect additional machinery.

Same of 24th: The Ophir is now pumped out, and a force of 24 men engaged in getting out rock. The past winter has been a heavy one, especially the Ophir, as they have had to contend with so much water.

Sixty-three tons of rock from the Shamrock ledge, south of the Forest Spring, yielded about \$2,000. In the 18 months, during which this claim has been worked, \$20,000 has been realized.

From the Grass Valley *Union* of April 26th: The incline on the Wisconsin is now down 250 ft., with a vein averaging one foot, and increasing. The quartz shows abundance of free gold, as well as sulphurets. It is estimated as worth \$100 per ton.

We yesterday saw very rich quartz from a new location, the Victory ledge, which is between Massachusetts Hill and the North Star Co's mine. The rock was taken out at water level, about 30 ft. from the surface, where a well defined 2-foot vein is exposed.

EXCELSIOR.—From the *Gazette* of May 1st: P. E. Jeffries and Ed. Fowler arrived in town yesterday from Meadow Lake. Times are quite dull in the district, but an improvement is anticipated as soon as the snow disappears. The Winton mill is the only one running at present. The Grant, Montreal, Golden Rule and Reduction mills will probably all be running by the middle of this month. At the present time the snow is about 14 feet deep, but has been melting off very rapidly in the past few days—sinking four or five inches a day. There are now about 400 inhabitants in Meadow Lake and vicinity.

## Plumas County.

From the *National* of April 27th: Davis, Bradley & Co., in the Shing claims, have been making from \$7 to \$16 per day for the past four months. Turner & Sons are making \$8 per day to the land. White & Co., from Gibsonville, have purchased the hydraulic claims of J. C. Gentry & Co. for \$2,500 cash. These claims pay largely.

From the Quincy *Union* of April 20th: The owners of the Blue Nose mining claims, in the mountain between Nelson and Hopkins' creek, have, after several years' work in prospecting, struck good pay in their diggings. . . . Williams & Radley have struck good diggings at the head of Rattlesnake Ravine, a short distance from Betsyburgh, and are getting as high as \$1 to the pan. . . . At the last clean up of the Crescent Mills, the company took out \$4,000, the result of one week's run of the mill. . . . Several of the new claims recently located on Dutch Hill are paying an ounce per day to the hand.

## Placer County.

From the *Stars and Stripes* of April 24th: The late strike in the Green Emigrant claim, of which we have made previous mention, has developed into an affair of fabulous richness. It exceeds anything we have ever gazed at in the quartz line. The pay streak has been followed until it is now about eight feet wide and the rock, which closely resembles red cement, will yield from \$100 to \$200 to the pan, of free gold. A few handfuls were washed on a shovel, last Monday, which realized about \$150. About \$3,000 have been panned out within the past few days. Lowry & McCarty, who have a contract which allows them the use of the ground until December, with the privilege of purchasing 800 ft. at \$15 per ft., have been offered \$50,000 for their contract.

From the Placer *Herald* of April 27th: The Golden Rule claim, near Horse Shoe Bar, have their 20-stamp mill nearly completed, and will soon be ready for crushing their rock.

A letter from Forest Hill to the Dutch Flat *Enquirer*, says there are 10 cement mills at work within a circle of three miles radius, of which that place is the center.

## Shasta County.

From the *Courier* of April 27th: The Mammoth mill is to be removed to the Harrison lode at Quartz Hill.

Tiffin's prospecting party of six or eight men will start out next week for the Upper Pit river.

Accounts from the South Fork mines are most encouraging. A large quantity of ore has been taken from the Chicago mine, and is ready for shipment to San Francisco. Work has been commenced on one of the Crystal extensions, and fine prospects obtained. The shaft on the Original Crystal is down 65 ft., and the lode at that depth is well defined and contains very rich silver prospects. Work on the Pacific is going on and the lode looks well, although rather narrow. Some very rich silver ore is being taken from this claim at present. . . . Speculation in claims and feet is not so lively as it has been, but more actual work is being done on the claims at present than at any time since their discovery.

## Sierra County.

From the Downville *Messenger* of April 27th: On the 19th, Mr. Peter Verineersch, who is mining on Goodyear's creek, near Oak ranch, in five hour's pining, picked up from the bed-rock a trifle over \$50. On the 22d, in about the same time, he got about \$25, and thinks by scraping up the fine gold he can get an ounce or two more.

Letter to same from St. Louis: The hydraulic miners are getting ready for operations as fast as possible, as the American Ditch is now bringing in 400 inches of water, and is increasing rapidly.

We noticed at the Downville Foundry, a few days since, a set of pumping and hoisting machinery, which has been got up to order for the Independence mine.

## San Bernardino County.

From the *Guardian* of April 20th: Messrs. Farcot, Moore, Garvey, and Lawler left this week for Holcomb Valley. Mr. Farcot takes with him a powerful steam pump. It is his intention to sink in the valley, collect the water in the reservoirs, raise it to the surface, and distribute it over the mining ground. Mr. Moore goes up to direct operations on the "Green," a gold bearing quartz ledge. There is a large mill on the premises, and a quantity of ore on hand for milling. The men have been engaged all winter in sinking on this ledge, and it is now down 185 ft. It is intended to fully test the rock with arastras. Mr. Garvey has some valuable quartz claims, and takes men up with him to prospect and develop them; He has an excellent mill upon one of them.

The interest in the Temascal tin mines is beginning to revive. The cloud on the title has been dissipated, by the dismissal of the case by the U. S. Supreme Court. Shares are changing hands. Several San Francisco parties are talking of purchasing and commencing operations.

## Tuolumne County.

From the Columbia *Citizen* of April 27th: Kane's claim has done well so far this year. . . . Reiley & Co's still promises well. . . . Coyle & Co's is paying exceedingly well. . . . Byrne, Herrin & Co's paid \$100 per share at the last clean-up, after a run of a few days. . . . McInroe & Co's is a good one. . . . So also Capt. Griffin & Co's. . . . The Cascade claim has been bought by Mr. Hanrahan, after a clean-up of 50 ozs. of gold. . . . Ford & Co's will pay well above wages. . . . Haynes & Co's, the Shilling claim, Boyentou's, and the Podeta give good indications for the season. The prospects for a good mining season are favorable.

## Yuba County.

From the North *Californian* of April 25th: The Rattlesnake Mining Co., at Brown's Valley, will start their mill this week. The Donnehroge mill will be in operation soon. The Pennsylvania and Jefferson mines are crushing day and night on rich rock.

Same of 27th: Messrs. Ward & Robery will complete a mill on the Bateman ledge at Dobbin's Ranch within two months.

Same of 29th, The Blue Gravel Mining Co. at Smartsville, last week, cleaned up \$60,000. This is the largest they have ever made. Three bedrock tunnels are now being run to open the Old River claim at other points.

## ARIZONA.

The Idaho *World* publishes a letter from J. A. Luckett, just returned from Arizona. He says: There are thousands of rich placer diggings throughout the Territory, but they are on the lands where water is very scarce. I think, however, when the country is rid of the Indians there will be machinery brought to bear on the ground that will give employment to thousands of men. Another great drawback to the country is the laws that were adopted allowing men to hold thousands of feet in quartz ledges, merely by marking off and recording, thus keeping capital out of the country; but their time will soon be out, and the day is not far distant when Arizona will be ahead of all the mining countries on the Pacific slope.

The *Miner* of April 8th says: Early last month 50 Apaches made an attack upon the

persons in charge of the buildings at the Mowry mine. Ned Marcy was instantly killed; R. M. Doss wounded; Hon. Oscar Buckalew, of the last Legislature, shot in the knee, and refusing amputation, will probably die. Everything would have been destroyed but for the timely arrival of Lieut. Hutton and party.

A large party of miners left Leavenworth for Arizona on the 18th inst., under the guidance of an old mountaineer, who professes to have discovered extraordinary rich mines, but to have been driven away by Indians.

From the San Bernardino *Guardian* of April 27th: A gentleman just from Prescott, gives us these items: For a month past, business at Prescott has been extremely dull. The Umpqua mill will commence running the first of next month. The Bully Bheno Co. are doing nothing at present. Capt. Wolsey is operating his stamps with considerable success. The large new 20-stamp mill at Wickburg, got to running week before last, and is at present turning out \$2,000 a day. The ore still continues good, and is entirely free from sulphates. This mill is owned by New Yorkers, and is the largest in the Territory.

#### BRITISH COLUMBIA.

From the *Oregonian*, April 3d: Reports from Forty-nine Creek are good. Old California and Cariboo miners say they believe it will be the best camp they have seen for a poor man since they left California; there are about 100 men there now; more going every day; the mines are easily worked, and pay from the surface down; prospects so far will pay from \$6 to \$18 per day. It is 90 miles from Colville.

#### IDAHO.

From the *Avalanche* of April 13th: Mr. Gove visited the Oro Fino mine during the week, and found the works in a better state of preservation than could have been anticipated.

The Hays & Ray lower tunnel is now in 600 ft., and the ledge is improving in quality. At the rate of progress so far, the tunnel will reach the Poorman works by the 1st of June. It has been decided to sink a shaft at the south line and at the bottom of the Poorman works to connect with the tunnel.

The shaft on the New York ledge is down 50 ft. The ore is carefully assorted in the mine. The Webfoot mill will be started as soon as the roads are in a passable condition. In a visit the other day to the first south extension of the Silver Cord, we panned out the decomposed and crumbled quartz, and found almost every particle to show free gold and sulphurets of silver.

The Rising Star mine, in Flint Dist., is yielding richer ore than ever, we are informed. We saw a small chunk from there which is more than half silver in weight. An assay recently made of this ore shows it to be worth \$5,999 per ton. As we are told, the quantity of this rich stuff is increasing. The Flint mills will both start up next week on Rising Star ore. Work on the Forrest has been continued through the winter. Two more companies will erect a 10-stamp mill in Flint this summer, with one of Knox's crushers.

From the Lewiston *Journal* of April 12th: All reports from the Lemhi mines confirm the belief that the area of that mining section is quite as large if not larger than the Blackfoot region, but no reports make the mines as rich. There is this to encourage miners in going there, namely, most of the country west and south of the present camps of Lemhi, is comparatively unprospected. The distance from Lewiston to the mouth of the Lemhi is about 260 miles. It cannot be traveled with animals before June.

The people of Warren's are subscribing toward the purchase of a quartz mill for testing the ledges in that camp.

The Walla Walla *Statesman* has a letter from Spokane Bridge, which says: Mr. Tim Lee has received news from Mr. John Fisher, of Kootenai notoriety, of a grand camp being struck on Thompson's river, a tributary of the Pen d' Oreille.

We learn from a private letter from Missoula City that about 100 miners were waiting at the mouth of the Joco for the snow to settle so that they could go to the new diggings. Thompson river is a tributary to the Pen d' Oreille. The mines are supposed to be south of the 49th parallel and in U. S. territory.

From the Idaho City *World* of April 13th: From friends residing in Pioneer City, Centerville, Placerville, Granite Creek, and other points in the Basin, we learn that active preparations are generally being made for the opening of the mining season, and upon a larger average scale than in any previous spring.

A miner's meeting in Dist. No. 4, Moore's Creek, voted April 6th, that all claims be laid over until the general price is 10 cents

per inch for 24 hours and dump free of cost, and all such claims shall be noticed on the first of May, and that creek claims be laid over from the first of December to the first of July.

From the *Statesman* of 13th: The road is alive with Chinamen. At Umatilla the seats in the stages are all engaged for 20 weeks ahead.

#### MONTANA.

From the *Post* of April 13th: "Neal" writes from Atlantic City: From claim number three above lower discovery, which is just being opened, I saw a prospect from one pan amounting to \$1.66.

"M." writes from Jefferson: The shaft upon No. 3, east, on the Gregory, is now 140 ft. deep, and the crevice at that depth is 16 ft. wide, containing throughout that entire width ore of exceeding richness.

"Voice," from Beaver Town: On the Casket lode they have a tunnel in 80 ft. and a 5-ft. crevice of richer rock than ever.

Alder Gulch will be alive with workers before the end of the week.

Turnley's Little Giant mill cleaned up on last Tuesday 183 ounces, being the proceeds of the last week's run from Whitlatch Union rock.

Letter from Argenta: I witnessed the last cupellation of 11,000 lbs. of rich lead from 1½ tons of Legal Tender ore. It yielded of 200 lbs. of pure silver. These works are a complete success, and this is due to the persevering energy of Mr. Deidesheimer, the Superintendent.

#### NEVADA.

**Black Rock.** From correspondence of the Susanville *Sage Brush*: In Virginia City can be seen a piece of Snow Storm ore, which has been treated in a smith's fire, and there is but little doubt but that one-fourth of its weight is silver and gold. Now, if it is silver alone, its value must be some \$9,000 per ton, and there certainly is more than twenty per cent. of gold.

**Esmeralda.** From the *Union* of April 20th: The lately discovered district of Washington, near Pine Grove, on Walker river, is attracting the attention of capitalists. A town has been laid out and christened Washington. There is plenty of wood and water. The most encouraging feature is, that the mine owners are not on the sell.

From the *Enterprise* of April 25th: A personal friend of ours, who is a practical miner, just in from Walker river, does not think much of Wilson's Dist., the veins being narrow, but speak well of Washington Dist.

From the *Trespass* of April 24th: Mr. Wilson, from Pine Grove, gives us these items: The tunnel upon the Wilson claim is in 400 ft., and is expected every hour to strike the vein. So far, 240 tons of ore have been worked, the first 67 tons yielding \$40 per ton. Twelve tons from the Wheeler worked \$54 per ton. The prospects of the Imperial are flattering. A large vein of good ore was cut last week, but cannot be worked at present, on account of water. The Midas adjoins the Wilson, and the tunnel is a joint affair between the two. Some ore from the Grant recently paid \$10 per ton. Miners are plenty, and the supply exceeds the demand at present.

#### Humboldt.

From the *Register* of April 20th: The St. John mine, in Sacramento Dist., is to be developed by parties in St. Louis. It is a vein of good size, and crops out boldly. It is situated within eight miles of the line of the Pacific Railroad.

Mr. Nason, of the Oreana Furnaces, furnishes return teams to the railroad terminus at Cisco, with his crude bullion as back freight at \$40 per ton. Nine thousand dollars of refined and ten tons of crude bullion has been shipped recently from these furnaces.

At Unionville, Fall's mill is kept constantly at work on ores from the surrounding mountains.

Arrangements are being made by the Seminole Co. to resume work at an early day. The Superintendent, Davids, is now in New York.

#### Reese River.

From the *Reveille* of April 20th: The first lot of ore from the Rigby mill at San Antonio was brought into town to-day. It amounted to 4,337 ounces. The bullion is the product of ore from ledges in Potomac hill.

Roasting furnaces are being added to the small mill of the Constitution Co. at Hot creek. Considerable work has been done on the Indian Jim.

From same of 23d: In Reveille Dist., the Fisherman ledge of the Bullion Co. is looking superbly. The vein is four to five feet wide, of \$500 ore. There is ore enough on the dump now to yield fully \$15,000 worth of bullion, and pieces weighing fifty pounds,

which would work a dollar to the pound, are seen lying around.

The Rutland mill is now working successfully. Wood is abundant at \$2.50 per cord.

Same of 24th: Preparations for work on an extensive scale are being made in the Cortez district. The Cortez Giant of the Mount Tenabo Co. is steadily worked, and exhibits a large body of improved ore.

Same of 25th: We hear flattering accounts of the Silver Chamber mine, on Union hill. At the bottom of the incline, the ledge is said to be five ft. thick. We were shown a sample of the ore, which will yield probably from \$40 to \$60 per ton.

The ledges of the Plymouth Co. on Lander Hill, are to be thoroughly worked. From the Kalesed, three tons of ore has just been reduced at the Parrott mill. An assay of the pulp gave an average of \$244 per ton.

Same of 26th: The Manhattan mill produced, in 11 days, billion of the value of \$25,000. The capacity of the mill at present is only ten stamps.

The Fuller mine, on Lander Hill, is yielding ore, the pulp of which assays from \$700 to \$800 per ton. The Buel North Star is also producing rich ore. The North Star mine of the Manhattan Co. is turning out the richest kind of ore in quantities beyond the capacity of the mill to work. The great Sherman shaft goes on. Fine ore is coming out of the Savage. The Magnolia is preparing to take out rich sulphurets ore with the new hoisting works. Work progresses on the Diana, Fortuna and Great Eastern.

From the Silver Bend *Reporter* of April 20th: The Silver Bend Co. have suspended work on their mine. Various reasons are assigned by outsiders, and none by the company. A very probable one is, that the company have already several months' mill supply of rich ore at their dump, and their mine is so well opened that they can keep up a constant supply, and they may as well suspend until their mill (now on the road) is received.

Mr. Arthur Doyle, on the 9th inst., discovered a monster ledge in Manhattan Dist., 18 miles from Belmont. It is 30 to 40 ft. in width, and is traceable for six miles.

A small train of camels and dromedaries are now engaged in conveying provisions to Mill Spring Dist., and returning with ore to Austin for reduction.

At Spanish Belt, Philadelphia Dist., the Wide West have sunk a perpendicular shaft about 40 ft. deep. At 15 ft. from the surface it passes through a ledge several feet thick, in which it discloses a body of ore extending nearly across the eastern side of the shaft, and three feet thick, as rich as the best found in the Highbridge ledge. The Westport Co. struck the vein 65 ft. in; but the ore was not so rich as that on the surface. It is believed that greater depth will develop a good mine.

On the 17th inst., the Combination Co. commenced a perpendicular shaft on the Highbridge, which is intended to be carried to the depth of 700 ft. It will be 16 ft. 8 in. by 5 ft. 8 in., divided into three compartments each 5 ft. square. It is intended to be the finest piece of work of the kind in Nevada (the Comstock lode excepted). The machinery for a first-class mill is on the way, comprising one engine of 100-horse power and one of 80-horse. It will have 50 stamps.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of April 25th: The Granite mill is crushing ore from the Savage mine.

Same of 26th: The Summit mill, 20 stamps, is crushing ore from the Chollar-Potosi.

During the week past, from the office of Wells, Fargo & Co., in this city, there were shipped 4,267 lbs. of assayed bullion, valued at \$130,291.99; from their office in Gold Hill, 4,183 lbs., valued at \$115,123.46.

Same of 27th: The Hoosier State mill will probably be at work in a fortnight. It will contain 18 stamps, 24 Knox pans, and four of Greely's patent pans, and will be capable of reducing 40 tons of ore per day.

Work is still being vigorously prosecuted at the new Hale & Norcross shaft. Just at present the rock is very hard and every foot taken out must be blasted.... The Chollar-Potosi is yielding immensely in excellent ores.

From the *Trespass* of April 23d: The engine at the Petaluma mill was started for the first time last evening, and worked well. It will reduce ore from the Kentuck mine.

The owners of the Trench ground, in Gold Hill, are working their claims through

an incline, double track, and hoist the ore with a windlass, keeping their mill in Silver City in active operation. The ore pays \$25 per ton.

Same of 26th: A very rich auriferous lode was cut last week in Palmyra Dist., a few miles from Como. In 1862, the Van De Water ledge was located at this point. Subsequently a tunnel of 434 ft. was run, but no ledge found; a shaft was sunk 60 ft. with no better result, and the work was abandoned. Recently the tunnel was continued into the hill by a party, who relocated the claim. After running some 25 ft., they struck a 9-ft. ledge of ore, which assays \$56 to the ton, of which \$54 is gold. Free gold is plainly visible in the rock.

From the Gold Hill *News* of April 23d: At the Crown Point, the company are taking out a little over 100 tons of pay ore per day. The Kentuck is taking out considerable ore of good quality: some of it is in fact uncommonly rich. The Yellow Jacket Co. are taking out a large amount of excellent ore at the south shaft. Most of this ore now being taken out in Gold Hill, is from the surface or above the upper level. It yields from \$25 to \$30 per ton on an average.

In Gold Cañon, two men can tend tailing sluices enough to save a ton and a half per day, worth from \$18 to \$22 per ton. The tailing mills work them for \$10 per ton. There are 75 sets of these sluices between Gold Hill and Nevada.

#### OREGON.

From the Jacksonville *Press*: The excitement with regard to the new diggings on Jump-Off-Joe continues unabated, and persons returning from there bring with them evidences of their richness in the shape of the genuine ore.

From the *Sentinel*: Crandall & Co., owners of the copper ledge on Fall creek, are now building a furnace for smelting purposes. The ore contains copper, gold and silver.

The *Avalanche* has been shown late letters from the Eagle creek copper mines, which speak enthusiastically of the large size and wonderful richness of the veins. Some of the samples are full of native copper.

The *Times* has seen a sample of very fine bituminous coal from Yaquina Bay. Beds of it have been found of three feet in thickness.

**A SUGGESTION.**—In the *Bulletin's* review of the annual report of the Nevada State Mineralogist we find the following, which we quote entire:

We wish, if it were possible, that an Annual Report of Mining might be published by the Geological Survey of California, which should aim to give, in a compact and trustworthy form, matters of immediate interest, the postponement of which to the day when the volume on *Technical Geology* may appear, is a loss of no small information to the busy, active miner, who has a right to ask that he may be supplied with much new matter of current and immediate interest. The full details of many such things can, we know, be properly given only in the most stately and dignified form of a quarto volume; but we presume there are ample materials at hand for the preparation and publication of such an Annual Review of the Progress of Mining as would be of great public utility. The Geological Survey feels itself limited at present to working on its larger mission within the appropriations which are so hard to secure each year; but we are convinced that if the Legislature would make a special appropriation for the preparation of such an annual as we have suggested, to be published by the State Printer, it would do much good to the mining interest, and aid to popularize the Survey. None but those who know the difficulties, prejudices and discouragements the Survey has encountered, and who are familiar with the wide scope of work it has laid out in a new and extensive field, can appreciate how much it has done in the accumulation of original scientific material as well as in the domain of practical information. It would, no doubt, be glad to do what we have suggested in addition, if it had the authority and the means.

Our sister State has set us a good example in this respect, and we hope on every account she will follow it up each year, and that we may not, from any cause, fail to copy and improve on it. The subject is suggestive, but we forbear, remembering that we are writing a book notice and not a review.

**FOR GRAPE GROWERS.**—The Visalia *Delta* of April 17th, says: We will give \$25 to any person in the State, who will raise a greater weight of grapes from one acre the present season, than are raised from the same space in the Tulare Valley. The proof shall be furnished and the award made at the California State Fair for 1867."

## Mining and Scientific Press.

W. B. EWER.....SENIOR EDITOR.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.  
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance.....\$5 00  
One copy, six months, in advance.....\$3 00  
For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with all obligations, and a faithful performance of all contracts. For references, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

**Mr. E. W. Felton**, is an authorized agent for this paper at Portland, Oregon, Dec. 1, 1865.

**Mr. Geo. P. Pitts** is a duly authorized agent for the Mining and Scientific Press at Portland, Dec. 23, 1865.

**Mr. C. Steele** will act as agent for the Mining and Scientific Press from this date, April 27, 1867.

**Mr. Chas. W. Marlette** is agent for this paper in In Colusa county and vicinity, April 27, 1867.

## San Francisco:

Saturday Morning, May 4, 1867.

## Notices to Correspondents.

ENQUIRER requests our views as to the best mode of preserving gold-fish. Our duties rather draw our attention to matters relating to fishing for gold, in place of piscatorial preservation. In common with many, however, we have felt and still feel some pleasure in observing the gambols of these diminutive dwellers of the aquatic element. Our own experience tends to show that a change of water oftener than twice a week is not desirable; handling is very undesirable; when such is required, a coarse cloth net should be employed. The temperature of the room should never be allowed to fall below 50° or 60° Fah.—in fact, gold-fish delight in a comparatively warm water, say from 70° to 80°, provided the other conditions required for their healthy growth are present. Gold-fish do not require much food; as, however, the water (excepting after heavy rains) which is now supplied to San Francisco, is almost void of animal, vegetable and mineral impurities, it is quite evident that the fish must deteriorate unless supplied with food of some sort—crumbs of bread, sparingly, and occasionally insects, or small worms, may be from time to time given them. The disease you allude to, which causes the fish to turn black and die, most probably arises from neglecting to supply these pleasing little fresh water denizens with one or the other of the requisites of life above alluded to. As a general rule, the globes ordinarily used to hold gold-fish are too small. In a good sized aquarium, furnished with aquatic plants and some of the common varieties of univalves, found in California fresh water, would doubtless render a change of water not necessary oftener than once in a fortnight. In any case, it must be seen to that a sufficiency of aliment to maintain life is furnished.

T. N., Austin.—We do not take the gloomy view you do respecting our mining prospects, whether as respects the current year or the more distant future. On the contrary, we conceive that we are on the verge of a more rational management; also, that more sober views will in future be entertained respecting not only the profits which may be anticipated, but also the losses which may be sustained in mining enterprises. In the commencement of the mining furore, the former passed all reasonable bounds, and caused "wild-cat" to be profusely scattered amongst credulous investors. A depressed feeling now almost as unreasonably prevails. Things will soon probably shape into their proper places, and a profitable and brilliant future looms at no very distant period.

COMMUNICATIONS RECEIVED.—"Copper Smelting at Campo Seco," by W. B. West; also, "Mining in Boise Basin," by John Hemsley. We have, at this time, quite a number of favors on hand from various correspondents, which will find a place in our columns as fast as we can make room for them.

THE FINEST BANK-NOTE ENGRAVING in the world is done in New York. The American Bank-Note Company supplies half the world with paper money to order.

## Important Improvement in Glass Making.

## AN IMPROVED GLASS POT.

One of the most difficult and important operations connected with the production of glass ware, is the making and setting of the melting pots. All who are acquainted with glass working, are aware that the pots in which the glass is made from its crude materials, and from which it is taken in its melted state to be fashioned into all the curious shapes in which it finds its way into the various avenues of commerce, are arranged in a circle around the inside circumference of a large circular furnace, placed inside of a truncated cone, open at the top, and from sixty to seventy feet high. The heat in this furnace is kept up at a very high point, in order to retain the melted glass in a constant state of fluidity. Muspratt fixes the heat of a glass furnace at 20,000° Fah.

In the manufacture of coarse glass these pots are open at the top, so that the heat may be applied directly to the material; but for the finer varieties of glass, the pots must be closed from the direct action of the flames, in order to keep the material free from the dust and other impurities produced by the combustion of the coal. In such pots the heat for melting and keeping the material in that state, must be passed through the walls of the pots; hence a greater intensity is required. This is, of course, attended with an increased expense of fuel and time, over that required for the making of common or green glass.

It is a little singular that in all the history and activity of modern invention, no improvement has been introduced into the form and construction of melting pots for making glass. The pots are the same to-day, so far as the economy of glass making is concerned, as those which were described some hundreds of years ago. They are made in two forms, one an open pot as above described, and the other hooded or covered over, to keep the impurities of the furnace from being mixed with the glass. These last, which are exclusively used in all flint or fine glass furnaces, have only a working hole open to the external air, through which they are filled with the charges of raw material, and by means of which the workman has access to the melted material when blowing. In the use of the covered pots, as now constructed, the heat and products of combustion pass out of the furnace through bye-holes, placed on each side of the pot. From these bye-holes, flues lead to the stack, by which the draught of the furnace is established and the smoke carried away. The "bath" or material is melted, as already stated, by forcing the heat through the walls of the pot, at great cost of fuel and time much in excess of that required to make common green glass in open pots. When open pots are used, the smoke and gases pass out of the furnace through working holes, and is taken away by means of an outer cone.

It seems to have been reserved for a California manufacturer to make the first material improvement in glass pots on record. Mr. Carlton Newman, of the firm of Newman & Brannan, proprietors of the San Francisco Glass Works, at the foot of Third street, in this city, has effectually broken the ice in this direction, and devised an improvement which, though simple in its character, bids fair to accomplish a most important work of economy in glass manufacture, whereby the time for bringing the metal for the manufacture of fine glass into a condition for being worked, is reduced from thirty-six to twenty hours. The saving of time and fuel by this improvement will be more fully understood when it is recollected that there are generally ten pots in each furnace, each of which have to be filled with new material as often as every other day.

The device by which Mr. Newman has

accomplished this, is simply an ingenious application of the well known principle of adding fresh oxygen to the liberated gases and smoke, from burning coal, before they pass into the flue for escape into the outer air, whereby they are more thoroughly consumed. The incidental advantages derived from this, are of far more importance to the glass manufacturer than the mere saving of fuel and time, as will hereafter be shown.

The gases and smoke which, in the present mode of constructing closed pots and furnaces for fine glass working are made to pass over the pots into the flues, are by this invention caused to pass into the pot during the process of melting, through an aperture in the top, at which point they meet a current of fresh air, by which they are ignited and kept burning, like a huge gas jet, in such a manner that a large volume of flame is made to play directly over the material to be melted (the working aperture, in the meantime, being closed), while the products of this gaseous combustion are conveyed from the interior of the pot through two conveniently devised apertures, opening from the inside and leading by proper flues to the main stack. When the glass is ready for working, all these temporary apertures are closed up, and the smoke and flames from the furnace pass up the stack through bye-holes, in the usual manner. The apertures are also prevented, by being so closed, from admitting from the outside any draft through the working holes, by which the interior of the furnace might be chilled. The extra cost of constructing a pot after Mr. Newman's invention, is a mere trifle, not exceeding one dollar.

The peculiarities of Mr. Newman's invention, and the difference between his mode of constructing the pots and those now in use, will be readily seen after reading the above, by any person at all acquainted with the construction of glass furnaces. It will, moreover, be readily apparent to all such, that one of the advantages of Mr. Newman's invention is to render the melting in a covered pot as effective and rapid as in an open one.

One of the incidental advantages derived from this circumstance, is the fact that the manufacturer, by the use of these pots, will be able to economically melt and work green glass and flint glass, in different pots, in the same furnace, without interfering the one with the other; which cannot be economically done by any pots or furnace-construction now in use. One important advantage of this will be readily recognized by every glass manufacturer, in which the necessity of different furnaces, suited for different kinds of work, is done away with, as well as the thriftless practice of exchanging orders—the flint glass manufacturer sending his orders for green glass to the green glass manufacturer, and vice versa.

In addition to the advantages already enumerated, there are yet three other important economical considerations derivable from this important invention, in furnaces where the pots are used exclusively for making green glass.

**First.**—By means of the great heat which can be maintained in these pots, the operator is enabled to burn off the "sandever" or salts, which appear to consist of an excess or impurity of the fluxing materials employed in the process of melting the "batch." Instead of having to remove this matter by lading or running it off by filling the pot up to its very brim (in either case wasting a large amount of glass at every melting), it is all removed by vaporization by an increase of heat and draft through the pot, that can not be obtained in the green-glass furnace. The removal is also much more complete than can possibly be effected in the ordinary manner. The well known injurious effect upon the "bench" or hearth of the furnace by the "running over" process, is by the use of this pot entirely avoided.

**Second.**—By using this pot in green glass manufacture, Mr. Newman has found it pos-

sible to use the common sulphate of soda waste of the acid factories, instead of the "soda ash" of commerce. The first is a useless product at present, while the latter costs in this market 4½ cents per pound, and constitutes a large item in the cost of glass making. This sulphate of soda is subjected to a partial desulphurizing process, by being roasted with pulverized charcoal, in a simply constructed reverberatory oven, which is attended with but little cost or trouble. Sulphate of soda is used altogether in Europe instead of soda ash (carbonate of soda) for the manufacture of green glass, although we believe that but one or two American glass manufacturers have yet been able to make use of it. Why it is so, we are unable to say, although it may possibly be from the excess of acid left in it by the American acid manufacturers. The successful employment of this cheap material in Europe should induce our own manufacturers to inquire more fully into the matter, to the end that they might also profit by the same advantage. The small excess of acid that may be left by our manufacturers could easily be removed if that should be any hindrance to its use.

**Third.**—But by far the most important economical consideration is the saving of furnace destruction, and the improvement effected in the quality of the green glassware produced by the use of this pot. All glass-blowers are aware of the destructive action of the "tears" or "slacks" which drop from the crown of the green glass furnace. They are produced by the alkaline volatilization from the pots, which, condensing on the crown of the furnace, unite with the silica and alumina of the bricks, and form a sort of glass, which melts and drops off until both the crown and hence are completely eaten away and the furnace destroyed. This is felt in every part of the furnace, and is greatly increased by the overflow of the "sandever," already noticed. By the exclusive use of these pots, all this source of destruction and annoyance is entirely removed, as no alkaline vapors whatever can enter the furnace. Hence, a green glass furnace, with the improved pots, can be made to stand five or six years, or as long as a flint-glass furnace, instead of being so injured as to require rebuilding every year, as is now the case.\* And yet further—these tears or slacks, as is well known, in furnaces of ordinary construction are constantly dropping into the open pots, from which they have to be picked out to prevent their becoming mixed with the glass; yet with all possible care to prevent this, a large number of bottles to each blower are daily destroyed by their pestilent presence. They form a foreign substance, which will not mix with the glass, but are sure to cause its fracture, either during the annealing process or upon the slightest carelessness of handling afterwards.

Much more might be written with regard to the value of this invention; but we have already exceeded the space we had intended, and must close by merely claiming this as one of the most important inventions among the great number of really valuable contributions which California has made in the direction of economical industry. These pots have been in constant use at the San Francisco Glass Works, in this city, for the past six months, and are found to accomplish all and more than is claimed for them. A patent has been granted for the invention by the United States Government, and steps are being taken to secure patents in the principal countries of Europe.

\*Green glass furnaces are rebuilt every year in most or all American glass manufacturing, although we understand they are made to last an average of about three years in Europe. The greater durability of European furnaces is due to the improved character of the materials of which they are built.

**GOLD AND SILVER TABLES.**—We have received from L. A. Garnett, Esq., manager of the San Francisco Assaying and Refining works, a copy of the above-named work. It contains, besides the tables showing the value of gold and silver per oz., at different degrees of fineness, rules for the purchase and sale of unparted gold bars; foreign gold and silver coins and their value; explanation of English assay returns; Mexican, French, and Chinese weights; relative value of avoirdupois and troy weights; comparative value of gold and legal tender notes; and other memoranda. The book is invaluable for bankers and gold dust buyers.

**ALPINE SILVER.**—A telegram from Mount, April 30th, is as follows: Seven thousand pounds Tarshish ore, worked at Ophir Mill, Washoe, turned out a brick worth \$1,050.

### Metallurgical Works--Important Enterprise.

We understand that T. H. Selby & Co., the enterprising proprietors of the lead-pipe and shot works on First street, are making preparations for the early establishment, in this city, of works for smelting lead ores. They have already collected the chief portion of the materials for putting up the works, and will commence their erection as soon as a proper location can be secured. They have recently established an agency at the head of navigation on the Colorado river for the purchase of lead ores and whatever pig lead may be produced from any smelting works which may be erected at the mines. Ores and metals will be purchased outright, or advances will be made on them, at the option of the sellers. The miners of that section, and indeed of every other portion of the Pacific coast, will thus be able to command the cash for their lead ores as soon as they can be delivered at any of the company's depots.

It was the expectation of this company when they started their lead works in this city, that the facility which would thereby be offered for an immediate market for lead ores, would be such an inducement as would call into existence smelting works for the production of the raw material in quantity sufficient for the wants of the manufactory; but the result has been far otherwise. Although the company has turned out some 1,000 tons of manufactured articles, they have been compelled to rely upon the Eastern markets for all but a mere moiety of their pig lead. The only successful lead smelting works hitherto started on this coast are those of the Trinity and Sacramento Silver Mining Company, in Humboldt county, Nevada, who are working an argentiferous lead ore. A full description of these works was given in our issue of February 23d; but the cost of transportation from that locality will preclude any very considerable delivery of lead from thence in this city until the Pacific Railroad shall be in operation as far as that point.

It is gratifying, however, to be able to state that our pioneer lead manufactory has proved so complete a success as to induce its enterprising proprietors, as already stated, to the still further investment of capital in that direction, in order to secure for their works a supply of lead from our native ores. The fact has now been fully established that valuable lead mines exist on this coast, and that they can be profitably worked, and nothing but capital and enterprise is needed to add their riches also to the already valuable and varied mineral productions of this coast. It is fortunate that so important an undertaking is to fall into the hands of gentlemen of such intelligence and means as will preclude any possibility of failure of the enterprise—not that lead smelting is difficult or in any way an intricate operation, for it is almost as simple as baking bread; but a Digger Indian makes a poor hand at that, and so will any person of inexperience fail in producing lead, be the ore ever so rich.

The great fault of Californians is their desire to experiment and improve; and, most unfortunately, those who enter upon such operations are generally those who lack the means to make more than one experiment, which generally winds up their business, and too often acts as an effectual discouragement against any further effort in that direction by other parties. We have reason for believing that the gentlemen who have this matter in hand will undertake no experiment, but will put up furnaces upon well established principles, such as have long been in successful operation in Germany and England, and employ in their construction and operation parties every way competent to carry out whatever they undertake. Appearances indicate that but a few years will elapse before the entire wants of California, in the way of manu-

factured lead, will be produced within our own territory and from the product of our own mines.

We further learn that it is in contemplation, as fast as circumstances will permit, to increase and vary these works, until they shall be able to treat every kind of ore, such as lead, copper, gold, silver, zinc, etc., until they have in operation as complete and varied a metallurgical establishment as the progressive requirements of our most varied mineral resources shall call for.

**THE GREAT CENTRAL COPPER MINE**, located at Williams' Fork, Arizona, appears to be now in full tide of successful operation. Letters have been received in this city, during the past week, from which we learn that the company's new and large furnace was fired up for the first time on Saturday, April 6th, with the most satisfactory results. "In two hours after turning on the blast the copper was running like water." After the fire was run down and the furnace cooled off, the hearth was found clean—the metal having all run off. The furnace was fired up again on the 9th ult., and was in full blast when the correspondent, whose letter has been submitted to our inspection, left the mine on his way to Prescott. This furnace has proven its capacity to smelt from sixteen to twenty tons of ore each twenty-four hours, producing according to the richness of the ore. It is the intention of the company to ship to this city all ores which assay forty per cent. and over, as the cost of smelting them, taken in connection with the present facilities for transportation, make it more profitable to ship high-grade ores than to smelt them on the ground. Freight is largely saved by smelting at the mine the low-grade ores. The average of the ores which will be smelted will be about twenty-five per cent. The shipping ores will assay from forty to seventy-five per cent.—averaging about fifty-five. The company had, at last dates, over one hundred and fifty tons of good smelting ore on the ground, and some fifteen tons of sixty per cent. ore for shipment. This ore is from the Eliza vein, and the Cornish miners thought they would have out from sixty to one hundred tons additional of shipping ore by the first of May, which would come fully up to the fifty-five per cent., as above. The company own seven veins under their incorporation, a portion of which will be worked for gold and silver. One of the copper veins, the Marion, has exhibited most remarkable developments within the few past weeks. The vein, at last accounts, was fully five feet thick, producing good smelting ore. We hope to hear further accounts from this interesting and important mine in a few weeks.

**PACIFIC LAW MAGAZINE**.—We have received the fourth number of this monthly. It contains, among other matter, No. 2 of what would seem to be a series of valuable articles on the subject of "Congressional legislation upon titles to mining claims, and the right of way over public lands to ditch companies," by Gregory Yale. Not having yet seen No. 1 of the series, we will only say here that we intend to look up the subject carefully, and give space to it in a future issue.

**LOWER CALIFORNIA**.—Professor Gabb and party arrived at San Diego on the 20th of April. An account of the expedition will probably be published soon. It will undoubtedly be an extremely interesting one, inasmuch as the country explored was one but little known, and the party possessed within itself every essential for the production of an elaborate scientific report.

**PACIFIC MUSICAL GAZETTE**.—We have received the first number of this journal, from Kohler, Chase & Co., the publishers. It is a neat monthly of 12 quarto pages letter press, and four pages of music. That such a publication is called for in this city is another gratifying proof of its rapid progress in culture and refinement.

**PURE SOAP**.—We recently visited the factory of Messrs. Lucy & Hynes, on Beale, between Mission and Howard streets, where for the past five years they have been engaged in the manufacture of their "Genuine Pale and Chemical Olive Soap." As one of the best evidences of the merits and public appreciation of the same, they have supplied the Government during the same period, on several different contracts, and on each occasion with no inconsiderable amounts. The specimens of soap examined in this extensive establishment, have every appearance of being entirely pure and free from all foreign substances, such as soapstone, plaster of paris, sal soda, or other impurities which often manifest themselves on exposure to a moist atmosphere in little frosty bubbles on the surface of any inferior or adulterated article.

**HOOKE'S EXCELSIOR PUMPS**.—Capt. V. Cushing sold four of these pumps in one day last week. One of these was to Geo. J. Griffing, for Holcomb Valley, via Los Angeles; one to Joseph Mulhill & Co. for Mexico; one to the California Land Mill and Mining Company, for Meadow Lake, Nevada county, and one for Woodward's Gardens. To the one last mentioned, which will be in a place accessible to every citizen, the inventor invites public attention, as a specimen of these pumps.

**THE FLOWING WELL IN SANTA BARBARA**. We are informed by a gentleman who arrived from Santa Barbara, by steamer, on Thursday last, that the report of a flowing well on the Ojai ranch, is without foundation.

**Brown's Filtering Heater**.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to Austin A. Wells, Agent.

—USE—  
**EMERY & EATON'S**  
**GREEN SEAL SMOKING TOBACCO.**  
16v14-6m No. 513 Battery street.

**Gold Bars**, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**J. W. WINTER, DENTIST.**  
First-class gold fillings for \$3, as good as any dentist can produce in the city. Dr. Winter has practiced Dentistry twenty years—fifteen in this State. For a full upper set of gum teeth, on vulcanite base, from \$20 to \$35. Teeth extracted without pain by local application. 18v14-tr

**THE CELEBRATED**  
**Self Generating Portable**  
**Gas Lamp.**  
This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

**Directions for Use.**  
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will then burn, sending out gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.  
A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.  
Manufactured solely by JOHN J. HUCKES, original proprietor, Factory, North Beach, San Francisco, and for sale by his agents in every city and town throughout the State. 18v14-3m

**Builders' Insurance Company**—

The highest price paid for Scrap Iron. 9v14-3m9p

**A. S. Hallidie & Co.,**  
MANUFACTURERS OF  
**FLAT & ROUND WIRE ROPE,**  
For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach.

**NOTICE**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Wire Ropes, which have been in use for a number of years by the leading mines on this Coast, and of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—  
**Round Wire Rope**—Iron or Steel, for Hoisting.  
**Flat Wire Rope**—

**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope**—For Ships' Rigging, Derrick Gays, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**—1/2 to 3/4-inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13-6m9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Raz, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, P, ae, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior Double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Priores concentrators, Washers, pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Rotors of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

U. J. BOOTH. GEO. W. PRISCOTT. IRVING M. SCOTT.

**BEACHING THE GREAT EASTERN.**—To complete the overhauling of this monster ship, necessary to prepare her for her summer's duty, it was decided to place her upon a gridiron specially constructed for her on the Cheshire side of the river, about one-third the distance between high and low water mark. It was 400 feet long, by 60 feet broad. The operation of placing her upon it was a delicate one, and the experiment was considered somewhat hazardous. But it was a complete success. The Liverpool *Albion* thus speaks of it:

"The first and only attempt was made with the morning tide on Saturday, and as the monster glided quietly and easily to her resting place, it seemed to be the simplest thing in the world. The Great Eastern moved from her moorings shortly after 9 o'clock, drawing 18 feet 6 inches of water. She was propelled by her screw, and was assisted by a tug or two. The tide was at its height at 10.20, and registered 18 feet 1 inch. Captain Sir James Anderson commanded, and was assisted by Mr. Brereton, C. E., successor to the late Mr. Brunel, and Mr. Tucking. She was put side on, and came smoothly and easily to the bed prepared for her without a single hitch. She was favored by smooth water. She was at once secured in her position by powerful anchors and chain cables, and early in the afternoon was high and dry. \* \* \* For eighteen or twenty feet her plates were covered with a peculiar kind of gray weed, like coarse hair, which, to any one standing quite underneath, gave her the appearance of the skin of a huge Polar bear just emerged from his icy bath. The wintry surroundings gave strength to this comparison. Myriads of mussels and barnacles had found a home among this weed, and, though her bottom is much cleaner than was expected, it will take much labor to thoroughly clean the surface."

THE Millmen's Association to-day offer a reward of \$1,000 for the detection and conviction of any amalgam thief employed in any mill, the owner or owners of which are members of the Association.—*Virginia Tresspass*, April 20th.

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c. &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Green Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

## EUROPEAN METALLURGICAL WORKS,

—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphurets, pyrites, and the (so called) "rebel-  
lious ores," are having special attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. P. KIMBALL, J. R. MURPHY.  
19v10

## MOSHEIMER'S Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that  
the nature of the ore may require.

Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

CONSULTATION OFFICE:  
328 Montgomery street, San Francisco.  
J. MOSHEIMER,  
26v13-3m Engineer and Metallurgist.

## J. A. BAUER, Chemical Laboratory,

AND DRUG STORE,  
644 Washington Street. [Established 1849.]  
SAN FRANCISCO.

Careful Analyses made of

Ores, Minerals, Waters, Oils, Liquors,  
Wines, Products of Art, etc.

## Pharmaceutical Preparations Made to Order.

Opinion given on Chemical Questions and Oology.

Particular attention paid to Analyses of all kinds, in  
cases where legal questions are involved.

Pure Nitric Acid. Nitrate of Silver. Gold Chloride, Platin  
Chloride, Sodium Amalgam, Sulphate of Copper, etc., for  
sale.  
12v14-6m

## EDWARD W. TIFFT,

DEALER IN ALL KINDS OF

WOOD AND COAL,  
No. 513 Bush street, between Dupont and Stockton,  
14v14-6m SAN FRANCISCO.

## Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN  
engagement as a working Superintendent in the con-  
struction or operation of a Quartz Mill. Has had five years  
steady and successful experience in working cream Wash-  
ing, and is practiced in saving sulphurets and the treatment of  
rebellious ores. Is prepared to furnish references for all  
the necessary qualifications of an intelligent, faithful and  
reliable quartz operator. P. M. SEAW.  
San Francisco, care Mining and Scientific Press. 10v14-3m

## New Mining Advertisements.

### Cineo Sinaloa Gold and Silver Mining Company.

Copala, Sinaloa, Mexico.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the first day of May,  
1887, an assessment of ten (10) cents per share was levied  
upon each and every share of the capital stock of said  
Company, payable immediately in United States gold and  
silver coin, to the Secretary, No. 623 Clay street, San Fran-  
cisco, California.

Any stock upon which said assessment shall remain un-  
paid on the thirty-first day of May, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Saturday, the twenty-second day of June, 1887, to pay  
the delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.  
EDWARD C. LOVELL, Secretary. m  
Office, No. 523 Clay street, San Francisco.

## Chiptonea Mining Company—District of Ures,

Sonora, Mexico.

NOTICE.—There are delinquent upon the following de-  
scribed stock, on account of assessment levied on the  
twenty-eighth day of March, 1887, the several amounts  
set opposite the names of the respective shareholders, as  
follows:

Names	No. Certificate.	No. Shares.	Amount.

Mosheimer, Jos.	56	26	125 00
Mosheimer, Jos.	57	26	130 10

And in accordance with law, and an order of the Board of  
Trustees, made on the twenty-eighth day of March, 1887, so  
many shares of each parcel of said stock as may be neces-  
sary, will be sold at public auction, at the salesroom of  
J. Middleton & Son, No. 404 Montgomery street, San Fran-  
cisco, California, on the twentieth day of May 1887, at  
the hour of 12 o'clock, M., of said day, to pay said delin-  
quent assessment thereon, together with costs of adver-  
tising and expenses of sale.

JOHN F. LOHSE, Secretary.  
Office, 318 California street, San Francisco, Cal. m4

## Chalk Mountain Blue Gravel Company.—Lo-

cation of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board  
of Trustees of said Company, held on the first day of  
May, 1887, an assessment of one dollar (\$1) per share was  
levied upon the capital stock of said Company, payable  
immediately, in United States gold and silver coin, to the  
Secretary.

Any stock upon which said assessment shall remain un-  
paid on the first (1st) day of June, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the seventeenth (17th) day of June,  
1887, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.  
J. M. BUFFINGTON, Secretary.  
Office, No. 5 Government House, corner Washington and  
Sansome streets, San Francisco, California. may4

## Diana Gold and Silver Mining Company.—Lo-

cation of Works: Lander County, Nevada.

Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment levied on the twen-  
ty-second day of March, 1887, the several amounts set  
opposite the names of the respective shareholders as fol-  
lows:

Names	No. Certificate.	No. Shares.	Amount.
F. H. Allen	230	5	\$15 00
I. C. Bateman	211	4	20 00

And in accordance with law, and an order of the Board  
of Trustees, made on the twenty-second day of March, 1887,  
so many shares of each parcel of said stock as may be ne-  
cessary, will be sold at public auction, by Jones & Ben-  
dixen, at the office of the Secretary, corner Front and Clay  
street, San Francisco, on the fourth day of June, 1887, at  
the hour of 12 o'clock, M., of said day, to pay said delin-  
quent assessment thereon, together with costs of advertising  
and expenses of sale.

N. C. PASSETT, Secretary.  
Office, cor. Front and Clay streets, San Francisco. my4

## I. X. L. Gold and Silver Mining Company.—Lo-

cation: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the thirtieth day of  
April, 1887, an assessment of one dollar and fifty cents (\$1.50)  
per share was levied upon the capital stock of said Com-  
pany, payable immediately in United States gold and silver  
coin, to the Secretary, at his office, in the store of J. O.  
Hodge & Co., 413 and 420 Clay street, San Francisco, Cal., or  
to John O. Shaven, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain un-  
paid on the thirtieth (30th) day of May, 1887, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Monday, the seventeenth day of June, 1887,  
to pay the delinquent assessment, together with costs of  
advertising and expenses of sale. By order of the Board of  
Trustees.  
S. B. STEVENS, Secretary.  
Office, 413 and 420 Clay street. m4

And in accordance with law, and an order of the Board of  
Trustees, made on the twentieth day of February, 1887, so  
many shares of each parcel of said stock as may be neces-  
sary will be sold at public auction, by John Middleton & Son,  
No. 404 Montgomery street, San Francisco, California,  
on the twentieth day of May, 1887, at the hour of 1 o'clock P.  
M., of said day, to pay said delinquent assessment thereon,  
together with costs of advertising and expenses of sale.

O. P. SUTTON, Secretary.  
Office, 404 California street, San Francisco. may4

**Lady Franklin Gold and Silver Mining Company.**—Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1887, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 345 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of June, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.  
Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. m4

**Whitman Gold and Silver Mining Company.**—Location of Works: Indian Springs District, Lyon County, Nevada.

The Annual Meeting of the stockholders of the Whitman Gold and Silver Mining Company, for the election of Trustees and the transaction of such other business as may come before the Company, will be held in San Francisco, at the office of Chas. Mayne, Esq., No. 535 Clay street, on TUESDAY, the fourth day of June, 1887, at twelve o'clock, noon.

THOS. W. COLBURN, Secretary.  
San Francisco, May 1, 1887. m4-5

**Mining Notices--Continued.****Arizona Consolidated Mining Company, Eureka District, Arizona Territory.**

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, will be held on MONDAY, the sixth day of May, 1887, at 7 o'clock P. M., at the office of the Secretary, 611 Clay street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

G. W. BUNNELL, Secretary.  
Office, No. 611 Clay street, San Francisco. ap20

**Adelia Gold Mining Company, Rock Creek, Sierra County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of April, 1887, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, A. C. TAYLOR, No. 429 Pacific street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the ninth day of May, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. C. TAYLOR, Secretary.  
Office, No. 429 Pacific street, San Francisco. ap13

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. B is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Millers' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 5v14tt

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

**ALBERT E. CRANE.**

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850

No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.**

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco: Dear Sir:—I have pleasure in informing you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED OBERMAN AMALGAMATING BARREL.** This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanatory description of this machine, will be found in the Mining and Scientific Press, of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street, San Francisco.

**Hooker's Patent Pump Valve.**

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve, which shows the India rubber facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C.

The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, are for sale by

**120 Front street, San Francisco.**

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

See illustration and description of this Pump, published every other week in this paper. 16v14tt

**Notice to Miners, Well-Borers and Water Companies.**

**M. PRAO** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for this branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

HUNTER'S  
Eureka Amalgamator!

**FOR WORKING THE SANDS AS THEY PASS FROM** the battery. The coarse particles of sand are reduced to pass through a No. 6 screen that would pass through a No. 5 in the battery; the fine flour gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The machine is four feet eight inches square on the bottom, and covered with iron dies 1 1/2 inches thick by four inches wide, extending across the bottom with alternate strips of wood on end of the same width. The rubbers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between rubbers. The box is also lined with copper plates. The machine is set in operation by eccentrics, giving an oscillating motion; and the rubbers are suspended on iron hangers, and adjusted by set screws.

One-fourth of a horse-power is sufficient to run one machine of ten tons capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from WM. WATT, Esq., of the Eureka Mill, will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is from rock that pays \$50 per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I have ever seen. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it, but the best recommendation I can give is that I want four more. Will you please go to the Vulcan Foundry and order them."

On the first of April I had an order for two more, for the Fulton Foundry, First street, will be promptly attended to.

**P. S.—Patent allowed.**

HUNTER'S  
IMPROVED CONCENTRATOR.

**THE INVENTOR OF THE ABOVE RECENTLY IMPROVED** Mining is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

For full description of this machine, see in operation at the Union Foundry, in this city, up stairs. 14v14

**To Quartz Miners and Others.**

**NOTICE!**

**I WISH TO CALL YOUR ATTENTION TO A PULVERIZER** of my own invention, which I have called the

**HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tallings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m

**STRONG & CO'S**

**CELEBRATED UNION PAN!**

A fast Grinder and thorough Amalgamator; has double Mullers, Rolling Shoes and reverse action.

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction of any Pan in operation, daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

[Written for the Mining and Scientific Press.]  
The "Gravity" Question—Again.

GRASS VALLEY, April 22, 1867.

**EDITORS PRESS:**—"Machinist," in your issue of the 19th ult., says "It is easy to see how I fell into the error," etc. Now I am not yet convinced that I am in error.

He says: "The center of the earth is the center of gravity for all the matter contained in the earth." This is an astronomical fact which I am not prepared to deny; but I do not believe that the attraction of the whole mass acts precisely as if it [the mass] were all collected at that point; and to convince him that such is not the case, and that he may possibly be in error himself, I will quote from some of the "elementary" works to which he refers me, and which I have been studying carefully for the last twenty years, only to find that they, like all other things of human origin, are fallible. I will now quote from Mitchell's Orbs of Heaven, page 104: "A power does seize the equator and plunges successive halves of it beneath the plane of the ecliptic; but do you now demand what power seizes the earth's protuberant equator and tilts it successively towards every point of the compass? I answer that the power is lodged in the sun and moon, and it is their combined action which works out these wonderful results. In case the sun and moon were so situated as always to be in the plane of the earth's equator, then they would have no power to change the position of the equator. But we know they are not in this plane, except when passing through it, and are found sometimes on the north and sometimes on the south side of it. Wherever either of them may be, the nearest half of the redundant matter about the earth's equator will be more forcibly attracted than the remote half, and the equator will be tilted toward the attracting body," etc. Again, on the same page, he says: "Thus does the earth's whole solid mass sway to the motion of the ring of matter heaped up around the equator." Again, on the same page: "Every particle of matter attracts every other particle of matter, and it is impossible for the sun and moon to exert any influence on the equatorial ring of matter which belongs to our globe, without feeling in their turn the reaction of this ring on themselves. The sun, from its size and distance may escape any visible effect; not so the moon. Her proximity to the earth, and her diminutive mass render her peculiarly sensitive to the influence of the redundant matter at the earth's equator; and as her attraction tilts the plane of the earth's equator, so does the attraction of the equatorial ring tilt the plane of the moon's orbit."

How now about the center of gravity? If the equatorial ring attracts the moon with more force than any other part of the globe, will it not act in the same manner on a mass of iron? or if not, why not? In this connection, I would call the attention of "Machinist" to the assertion made in the elementary works he refers me to, "That if a piece of lead weighing four pounds be taken half way down to the earth's center, it will weigh only two pounds. I think there is a little geometrical mistake here. I am under the impression (not positive) that it would weigh only one-half pound, or one-eighth of what it weighed at the surface. Will "Machinist" give this problem a few days close study, and give us the result.

A. C. D.

**A FORMIDABLE WAR SHIP.**—When the Kalamazoo is finished, she will be the most formidable war ship afloat. Her armor will be fifteen inches thick entirely around her, with two turrets of eighteen-inch thickness. These turrets will each be armed with twenty-inch guns, carrying balls of 1,080 pounds weight. With four such monster guns, and with iron sides fifteen and eighteen inches thick, she can place herself with perfect safety in the very midst of a whole fleet of ordinary ironclads. The ironclads of Europe will be hut scare-crows in her path. The last number of *Blackwood's* (Edinburgh) Magazine contains an article paying a high compliment to the efficiency of American ironclads, by the side of which the writer thinks the English ironclads appear to quite a disadvantage.

**A FEAST OF REASON.**—Prof. James Hall, says a correspondent of the *Evening Post*, New York, March 16th, gave last night a select entertainment at the State Museum of Natural History. A number of celebrities were present. After the dinner, which was without wine, the health of the Professor was proposed, and responded to in an eloquent address. The Professor is an enthusiast, and his reply was a lecture on American geology, intensely interesting. He said that a previous continent once filled the North Atlantic ocean, and drift from it produced America. The first land was the Adirondac region, then the highlands, after which the other parts of the State and continent came into being. The higher mountains were produced last, even in the Adirondac country. The iron of Essex county, a fine magnetic ore, was deposited there in beds instead of in veins, and was the most valuable in this part of the continent. The geology of New York had been, he remarked, more thoroughly studied than that of any other part of the world. Even in New England learned men had made mineralogy rather than geology their study, and had let lessons from the rocks comparatively alone. In Europe all writers on geology began by quoting the natural history of New York. So also in Canada.

**Gaston's Screw Grinder and Amalgamator**

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the hub of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is effectually rubbed by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed in and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, **H. A. GASTON**, at Cosmopolitan Hotel, San Francisco; or **R. L. THOMAS, Esq.**, Virginia City, Nevada.

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**

**FOUR SIZES,**

**8, 10, 12, and 15-Horse Power,**

**HOADLEY'S.**

**3 to 40-Horse Power.**

**HITTINGER'S.**

**THREE SIZES,**

**5, 7, and 10-Horse Power**

**HITTINGER'S.**

**TWO SIZES,**

**5 and 7-Horse Power,**

**COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, AND ECONOMY, with the Minimum of weight and price.**  
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
All sizes on hand from 3 to 30 horse power, with and without carriages.  
Also, Portable Saw and Orist Mill's.

**COAL DISCOVERY IN ALAMEDA COUNTY.**—Mr. John S. Royal has recently made what bids fair to be a valuable coal discovery in Corral Hollow, in township three east and three south from Mount Diablo meridian. The coal was discovered at a point in a ravine near where the late rains had washed out the earth some thirty feet deep. Mr. Royal assures us that the vein is fully eight feet thick. Being near the surface, it is, of course, very much decomposed, and shows the unchanged coal only in thin seams, one of which, however, is some six or eight inches thick. The character of the samples brought in give evidence of a most promising vein, and its position is such that it will require but a small amount of capital to develop it. It is convenient of access by an excellent road already constructed to the San Joaquin river, while the line of the Pacific Railroad from San José to Stockton is located within four miles of the mine. Coal has been known to exist in this vicinity for several years past, and several hundred tons have been brought from thence to this city. It is a portion of the Mount Diablo coal bed, but has been elevated by an east and west up-throw. It is evidently of a very superior quality, containing less sulphur and more bituminous matter than most of the Mount Diablo coals. The discovery is certainly almost promising one, and well worth the attention of capitalists, whose assistance is needed for its development.

**COAL AT THE BUTTES.**—Clark, Bruce & Co. are reported to have struck a good quality of ore on the west side of the Butte mountains, near the Colusa road. The shaft which has been sunk discloses three separate veins (at or near Mount Diablo). The proprietors intend to continue work, and are sanguine of success. The coal has been tested at Marysville, and is pronounced of a superior quality.

**CARBONDALE,** according to the *Contra Costa Gazette*, is steadily improving—a number of new buildings have been erected this spring, and the place is gathering permanent population. Ben. Jones has reached the vein in his mine, and at the level struck finds the coal of fine quality.

## Crawford's Stump and Rock Extractor and Elevator.

STUMP AND SNAG PULLER.

PRICE OF MACHINES:—No. 1, 10 tons, \$200; No. 2, 15 tons, \$275; No. 3, 20 tons, \$350. Small Model Machines—weight 30 pounds—lift 1-2 to 3 tons, \$75; other sizes to order.

These Machines are adapted to all kinds of work, and where labor is scarce they are invaluable. Two men can work the machine. A few of their uses are: Loading boilers, granite, heavy ordnance in casemate, or any heavy body. For mountain teamsters they are of great value, lifting wagons, etc., clearing lands of stumps, moving boulders for miers, or for railway companies. There is scarcely any work of moving heavy bodies which they are not adapted to. Single Machines, or Right of City or County, and all information can be obtained by letter, or otherwise, by application to  
San Francisco, April 17, 1887. [16v14eowlm]

GRUB AND ROCK EXTRACTOR.

Small Model Machines—weight 30 pounds—lift 1-2 to 3 tons, \$75; other sizes to order.

Office California Steam Navigation Company.

## BAKER & HAMILTON,

IMPORTERS AND DEALERS IN

**Agricultural Implements, Portable Steam Engines, Hardware,  
Rubber and Leather Belting, Etc., Etc.**

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire, grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire box, and can be blown off daily by the blow-cock and vent, the ash-pit by which means the Boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

**HOADLEY'S THRASHING ENGINES.**

**HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.**

FOR SALE BY

**BAKER & HAMILTON,**

Front St., bet. Pine and Market, San Francisco.  
18v14-17

J STREET, NEAR THE LEVER, SACRAMENTO.

**Perry Davis' Vegetable Pain Killer,**

After a thorough trial, by innumerable living witnesses, has proved itself the Medicine of the Age. Although there have been many medicinal preparations brought before the public since the first introduction of Perry Davis' Vegetable Pain Killer, and large amounts expended in their introduction, the Pain Killer has continued to steadily advance in the estimation of the world as the best Family Medicine ever introduced. It is an internal and external remedy. One positive proof of its efficacy, is that the sales have constantly increased, and upon its own merits. The effect of the Pain Killer upon the patient, when taken internally in cases of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy in cases of Burns, Bruises, Sore, Sprains, Cuts, Sting of Insects, and other causes of suffering, has secured for it such a host of testimony, as an almost infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

Sold by all Medicine Dealers everywhere. 18v14-1m

## Foundry for Sale.

A One-half Interest in the  
**UNION IRON WORKS,**  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
Sacramento, Cal.  
26-1319-19p

## Pacific Mail Steamship Co's

STEAMSHIPS FOR

**NEW YORK, JAPAN AND CHINA.**

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from PANAMA for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following steamships will be dispatched on dates as given below:

May 10th—GOLDEN CITY.....Capt. Jas. T. Watkins. Connecting with HENRY CHANCEY, Capt. Cray.

May 18th—MONTANA.....Capt. Jos. Sutton. Connecting with ARIZONA, Capt. Harris.

May 20th—SACRAMENTO.....Capt. J. M. Cavarly. Connecting with OCEAN QUEEN, Capt. Manly.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

**OLIVER ELDRIDGE, Agent.**

ROBERT S. WHIGHAM, whose name is familiar to most of the early quartz miners of Nevada county, died in New York, on the 3d of April last, of consumption, at the age of forty-five. The deceased was one of the pioneer quartz miners of Nevada county, having located a claim and erected a mill near Nevada City in 1852, on what he called the Pittsburg, but which has since been more popularly known as the "Whigham" lead. From that time to the day of his death, he has been actively engaged, with varying fortune, in developing the quartz mining interests of California, and in that portion of the neighboring State of Nevada, known as Esmeralda. Although the mine located by him proved disastrous to his fortunes, it has since so improved as to have become a most valuable property; while Mr. W. within the past two or three years has so improved his own pecuniary prospects, as to be able to leave a handsome competency for his family. We have known Mr. Whigham intimately for the last fifteen years. He leaves a large circle of friends, who knew him only to respect him, all of whom will be deeply pained to learn of his death, in the prime of manhood and in the midst of usefulness.

PRACY'S NEW MACHINE WORKS.—Mr. Geo. T. Pracy, in his new machine works, Nos. 109 and 111 Mission street, below Main, has just completed a steam engine of fifteen-horse power and eight-inch cylinder. The governor is one of the best, being of improved and simple construction. Self-acting steam piston packing, for which superior merits are claimed, has been adopted for this engine. Mr. Pracy has recently completed one of Huntington's new patent shingle machines, capable of turning out from 25,000 to 50,000 shingles per day. It is one of the simplest and best machines of this character now in use. These machines and, in short, most kinds of machinery, are manufactured by Mr. Pracy, samples of which are constantly on hand at his works.

NORTH'S SHIP YARD.—At John G. North's ship yard, on the Potrero, the steamship Orizaba has recently left the ways, where she has been undergoing a thorough repairing. About one hundred carpenters and caulkers have been at work on her. This steamship is of 1,200 tons burthen. Mr. North's facilities for repairing all kinds of vessels, except those of the largest size, are unequalled on this coast.

## Colby's Patent Compound Motion Churn.

The various forms of churns which have been from time to time devised, may be divided into four classes or divisions: First, those in which the fluid, the vessel containing it, as well as the agitators, are all in rotary motion—such churns are complicated and seldom used. Second, those in which the receptacle for the fluid is at rest while the agitator has a rectilinear, vertical action—such as the old-fashioned churn, with a common dasher to play up and down. Third, those in which the vessel is at rest and the agitators placed in a rotary motion, vortically—the manifest inferiority of action

gravity than either of the above substances; hence it so readily "rises" in the form of cream. Cream, however, contains more or less of all the other component parts of the milk. The butter with which milk is churned, nearly all of which rises with the cream, is contained in little cells or globules, the walls or envelopes of which prevent its coming together into a mass in its natural state. The first thing that is to be done in making butter, is to break these envelopes. This must be done by agitation; the moment the envelopes are broken the butter runs together in a mass. Hence the necessity for churning.

Now the most perfect churn is that which, in agitating the mass, will most effectually seek out and break up these innumerable and infinitesimally small globules. If you give the whole mass of cream a sort of rotary movement, *in bulk*, as in the first class of machines noticed at the outset of this article, there will be but a very slow *breaking up* of the butter globules. The up and down motion of the second class is better; but the cream still moves about, in large bodies, without being finely divided or pulverized, if we may use such an expression. So with those machines, of the ordinary make, of the third and fourth classes—the cream is rolled about in large masses, and the globules glide smoothly over one another (in consequence of their oily nature) without breaking.

We do not know whether Mr. Colby, in devising the churn here-with illustrated, studied into the philosophy of the work he was endeavoring to provide for, as above; but if he did not, he has been remarkably fortunate in hitting upon a device which certainly comes nearer to the work of any other inventor we know of, to what a chemist would pronounce to be necessary; but which very few chemists would have the mechanical ingenuity to devise.

By a close examination of the illustration, it will be seen that by means of two principal geared wheels working into two spur wheels (only one of the spur wheels being shown), there is a double action to the horizontal dashes; the inner one, consisting of four sets of arms radiating from a central axis, revolving one way, while the outer one, consisting of four longitudinal dashers, held in position by four arms on each terminal of the axis, revolve in an opposite direction. The complete *breaking up* of the cream by such an action must be at once apparent. Farther, on examining the radiating arms of the inner dasher, it will be seen that they have beveled faces—the bevel upon each successive series being made at an opposite angle, by means of which, in addition to the excessive agitation communicated by the double action of the dashers, additional disturbance is given to the liquid, similar to that which would be produced by a double propeller screw, set in close connection on the same shaft, with faces to propel in op-

posite directions. It would be difficult to conceive of any device for effecting a more complete and complex agitation than is thus produced. In short, Mr. Colby seems to have exactly hit the mark, and the globules of butter must be excessively fine in that cream where every one of them is not hit and broken by the action of his churn in the course of ten minutes. He assures us, in fact, that he has made butter with this machine in *five minutes*, and he *guarantees* that every one of the machines, of nine gallons capacity, worked with the ordinary speed of hand work, will make butter in *ten minutes*—that, or no sale.

This useful machine is, moreover, a California invention, for which a patent has been obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. It is made and sold at from \$15 to \$40, according to size. For further particulars, inquire of O'Neil & Colby, 12 Sutter street.

of such machines renders their use very unfrequent. Fourth, those in which the vessel is at rest and the agitators in a rotary motion on a horizontal axis. Such is the class to which the machine herewith illustrated belongs. The varieties into which these four grand divisions are subdivided is almost innumerable; but we do not recollect, in all their multitude, to have met one of these useful machines which combines so many advantages as the one which we are now about to describe. In order to fully understand the advantages of this machine, it will be necessary for the reader to call to mind, for a moment,

### THE PHILOSOPHY OF BUTTER MAKING.

Milk is a compound substance, consisting of a *butyaceous* or oily matter, from which butter is derived; a caseous matter, from which cheese is formed; a saccharine matter, known as "milk sugar," which is present in the milk of all female mammals that feed upon food containing starch, but absent from the milk of all carnivorous animals which live solely upon flesh; a trace of saline matters—all the preceding being held in solution in about eighty-six per cent. of water. The total amount of *butyaceous* matter which we are now to particularly consider, varies from three to four and a half per cent. It is also of less specific

THE U. S. GRANT.—We have seen, at the office of Mr. Buffington, in the Government Building, some very fine specimens of auriferous quartz, from the U. S. Grant mine of Meadow Lake district. These specimens show a large amount of free gold, in a rock highly charged with sulphurets. Mr. Buffington also showed us some very beautiful specimens, much resembling those which are frequently found in furnaces after the fires have been suffered to go out. They present the most unmistakable evidences of the great heat to which that region has been subjected. Crystals of iron pyrites, in cubes, even half an inch in size, were shown, completely buried in a kind of slag, while the cubes themselves were scarcely changed, even on the surface; giving evidence that they had been at some considerable distance from the intensity of the heat, the molten incrustations having either fallen upon them from above, or been deposited upon them by sublimation from below. They also furnish the evidence that the fires were *subsequent* to the formation of the vein, as the crystals have been first perfectly formed—probably by aggregation—and subsequently affected by heat. A 5-stamp water mill was erected upon this mine last season, which run but a short time before winter set in. Work upon the mine, however, has been continued through the winter, and a large amount of ore has been taken out for summer crushing. The mill was to have been started the present week. This mine is worked by an incorporated company, nearly all the stock being held by those actually engaged in work upon the mine. That is the way to make a mine pay.

WAR TO THE KNIFE IN ARIZONA.—A Los Angeles telegram, May 4th, says that passengers just arrived from Prescott, report that a general war of extermination is to be waged against all Indians except Mohaves and Chimahuervis. The opinion of Gov. McCormick, long ago expressed, that it was time to put an end to all trifling with the subject, is now the opinion of Gen. Gregg, who in three recent fights, forty miles from Prescott, killed fifty-four of the redskins. The settlers are much pleased at the prospect of being ultimately freed from these savage pests.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 274.]  
UNION DISTRICT.

We are now fifty-five miles distant from Austin, in a south of southwest direction, and again in a section of country stirring with life and enterprise. Ione, the principal town in this district, is the county seat of Nye; but the late Legislature has provided for the removal of the county records, on the fifteenth of May next, to Belmont. This is eastward, over two ranges, and a more central part of the county.

The first discovery of silver in this district was by Messrs. McGee and McIntire, in the summer of 1863. This was in the vicinity of Grantsville, in the southern portion of the district. In the month of November following, the northern portion, where Ione is situated, was explored by Messrs. Haight, Carpenter and others. They were soon followed by other parties, who were rushing hither and thither over the country, from the older settlements. Early in the winter of that year, Upper Ione, containing forty or fifty houses, was rapidly built up. The site of this town is a beautiful spot, in a broad expansion of the cañon, the lower portion of which abounds with springs of most excellent water. The town was, to all appearances, completely shut in on every side by lofty pines and hills, while at the lower outlet, leading to the Sinkavata Valley below, there rises an immense quartzite bluff, with walls nearly perpendicular and sixty or seventy feet in height. Notwithstanding the many advantages and the natural beauty of the situation, this town has now gone to decay, as it was subsequently found to be too distant from the principal belt containing the mines. Three-fourths of a mile further down, where the cañon again expands sufficiently for a commodious street, with ample building room on either side, was built the present town, which contains a hundred or more houses, and which, at one time, had a population of five or six hundred, but which is somewhat less at present—Ione having furnished a large share of the population which has discovered and settled the rich districts by which it is surrounded. It was at one time on the high road to prosperity; but here again the blight following the insane policy of mill building before the mines were opened, swept over the Ionians. Their pioneer mill of ten stamps, was completed in the spring of 1865, by Messrs. Stewart & Bragg, and found the miners utterly unprepared to supply it with ore; consequently, suits and executions followed, and the mill was closed by the Sheriff, and remains so to this day. The miners became discouraged, neglecting their mines, rich as they are known to be.

"During the short period this mill was in operation, the yield from such ore as they were able to obtain was abundantly satisfactory, and gave the most positive evidence of the richness of the mines, which are situated in the hill southeast from the town. They occur in syenite, and are worked with the greatest facility; and, notwithstanding they have yielded, and six or eight of the lodes are now yielding ore that works from \$100 to \$250 per ton, not a single shaft has yet reached the water line. The Northern Star, Crown, Indianapolis, Mountain Brow and Brown lodes, are among the many that have produced ore of a high grade, and are all being worked at the present time.

Now we come to another chapter of mismanagement and folly. During the summer of 1865, the Knickerbocker mill, a fine structure, of twenty stamps, was erected by Eastern capitalists at a probable cost of over \$130,000. The mill is situated three miles

south of Ione, and equally distant from the nearest mines, the company not owning, previous to its completion, a single lode that had, or ever would, produce a ton of pay ore. This mill was completed in the spring of 1866, and is now running on such ores as it can procure from Ione, Mammoth District and Grantsville—the former three, and the latter respectively ten and seven miles distant. This is their only salvation. Owing to the high grade of ore in this vicinity, they may be able to keep on their "pins" at the cost of hauling ore that distance.

This company purchased the Great Eastern mine, Grantsville, of P. A. Haven & Co., nearly a year ago, and are now driving a tunnel to strike the lode at great depth. When completed, they expect to supply their mill from this mine alone, the surface ore having worked satisfactorily.

In the southern part of this district, also, on the western slope of the Shoshone Range, many fine lodes have been partially opened, and the indications are that when the mines of this section are in readiness for reduction works, its growth and progress will be healthy and substantial. In the summer of 1865, the machinery for a twenty-stamp mill was freighted into this vicinity; but, by the prudence and foresight of the superintendent, its construction will be delayed until their mines are sufficiently developed to guarantee a supply of ore.

Two miles north of Ione we find Agate Hill, famous for its beautiful agates. This has been called, and with some truth,

## A MOUNTAIN OF AGATES.

So abundant are they found. They occur in a belt about one hundred feet wide, crossing a ridge which slopes gently to the east and abruptly to the west, covering a space of about an acre. In places on the surface where the soft gangue has been washed away by the rains, the agates are left in great abundance, covering the ground five or six inches deep. By digging into the gangue, they are found thickly interspersed throughout.

Ten miles further north, on the west side of the range, is situated

## NORTH UNION DISTRICT.

Of the mines here but little can be said, they being entirely undeveloped. The lodes here were discovered early in the spring of 1865, and are found mostly in a gray slate formation. The characteristics of the ore, as far as can be determined at the surface, appears to be green and blue carbonate of copper; occasionally black oxide of copper and chlorido of silver. These lodes give considerable promise of eventually proving permanent and rich. The Hamilton Gold and Silver Mining Co., a Philadelphia organization, own some ten or twelve of them, and it is possible that this district may be the scene of active operations during the coming summer. The unsurpassed milling facilities and abundance of timber will aid in inducing the early development of this district.

This range of mountains is the line dividing the territory of the Shoshone Indians on the east from that of the Piutes on the west, and on ordinary occasions is considered and occupied by both as neutral ground. Neither tribe seems to make their residence here for long periods of time, merely visiting and remaining during the season for

## GATHERING PINE NUTS.

Which usually begins in September. The nuts from the "piñon," which constitutes the principal part of the timber throughout nearly the whole of Nevada, afford the Indian tribes fully one-half their sustenance. The cone that produces the nut is similar in form to others of the "conifera," and is from three to five inches in length; clustered around the center at the base of each lap or scale of the cone, are the nuts, twenty to thirty in each cone, and the trees in their bearing seasons are loaded with the latter. The Indian method of harvesting is to gather the cones into large piles, mixed with light brush and dry leaves; fire is then set to the piles, and the pitchy outside of the cone and dry brush burns readily. When sufficiently roasted, the cones burst open and the kernels are partially exposed. The pile is then spread out and thrashed until the nuts are separated; the coarser part is then raked off, and the remaining mass winnowed by the squaws until the nuts are left quite clean. The harvest is generally cached for future use near the spot where gathered. These Indian women show considerable skill in the operation of winnowing. In this, as in all else pertaining to labor, they are the sole operators. The Indians assert that the forests of each mountain bear in turns; but it is more probable that the production of the nut is biennial. I have noticed that the cone is formed and attains a considerable size the year previous to its ripening.

We have now visited all the principal

districts on the western slope of the Toiyabe Range and those of the Shoshone Mountains. Across the Sinkavata Valley, ten miles distant, we have a fine view from here of the Mammoth Range, with its subdued and symmetrical rounded peaks, black with its forests of piñon growing from the valley to the summit, and stretching north until the two ranges appear to blend, and south as far as our vision reaches.

[To be Continued.]

[Written for the Mining and Scientific Press.]

## Copper Smelting at Campo Seco.

BY W. B. WEST.

EDITORS PRESS:—In compliance with my promise, I give you a few items of my experience in copper smelting at Campo Seco. The works were projected in May, 1865, and were designed to produce matte from the poor-grade ore of the Campo Seco mine. They were finished and running by November of the same year. The improvements consisted of a railroad three-quarters of a mile long, connecting the mine with the smelting works, and delivering the ore upon platforms dug in the side of the hill for the roasting kilns, a coal house, laboratory and a large building for smelting. The latter building was forty by sixty feet, and contained two cupolas and blower. Our cupolas were of sandstone, lined with the same, or soapstone, sometimes. I did not find any great difference in the material; neither of them lasted more than twenty days. The blower was McKenzie's, driven by water power. The establishment was so arranged that the ore was continually carried down hill from the time it was hoisted from the mine until it was put into the furnaces. The slag was dumped into the Mokelumne river by wheeling it a few feet. In this way all unnecessary labor was saved, and the work done in the most economical manner possible.

Our object was not to make pure copper, but only matte of thirty-five per cent. At that time matte was selling in San Francisco at \$3.25 per unit. I therefore judged it to be more profitable to smelt once and make rich matte, than to go through the more difficult and tedious process of making copper, especially as our ore was a difficult one to treat, and I had no skilled labor. The character of the ore rendered it difficult to work alone. It was an almost pure sulphide, seldom containing five per cent. silica. The average of sulphur was from 40 to 48 per cent.; iron, 40; copper, 6 to 10. The better grades were all shipped.

Any one familiar with copper smelting can judge of the difficulty of working this ore. It was almost entirely free from silica; so I was obliged to add from fifteen to twenty per cent. pure quartz to flux the iron.

The process of roasting proved a difficult operation, the ore smelting down in the heap and forming a hard combination to smelt again. The utmost care did not prevent some from being smelted. I found the best preventive was to mix ten per cent. quartz or half-roasted ore with the heap. It is easy to give instructions for regulating the roasting of copper in heaps; but to manage an ore that contains so little gangue and so much sulphur, is no easy matter.

The ore smelted quite easy; the only trouble experienced was when the charge was too well roasted (too free from sulphur). The iron was apt to "salamander" in the furnace. The usual amount smelted per day was from eight to ten tons of 2,352 pounds per day, exclusive of fifteen to twenty per cent. flux. The average amount of coal was 250 bushels per day. Labor: two furnace men, two slag tenders, two feeders. There were other men employed getting down ore, breaking matte, and mixing the charge. In an operation like copper smelting, some reliable men are necessary, but a majority of the work can be done by Chinese. It is, however, absolutely necessary for the superintendent to know his business, and to have furnace men upon whom he can depend. It is no easy matter to run a furnace successfully; changes occur that require constant care and watching. This is especially the case where charcoal is used for fuel. It is not sufficient for him to know the requisites of a furnace only, but he should understand the metallurgy of copper.

Many changes have occurred in copper since our works were started; the price of copper has gone down to a figure that hardly

could have been predicted. The smelter should, if possible, bring his expenses to the lowest figure. I believe that even at the present price of copper in the Atlantic States and Europe, copper can be produced from sulphurets profitably—that is if the shippers do not take the lion's share.

My experience in the expenses of shipping matte lead me to believe that a smelter in California should produce only pig copper, or, perhaps, to a limited extent, for home consumption, a refined article. The expense of making pig copper will be more than counterbalanced by the extra expense of freight, sacks, and charges in San Francisco upon the matte, while the pig will be worth a greater price per unit than the matte. With proper management, a good article of copper can be made from carbonates, oxides or silicates with one smelting; but as usually conducted in this country, it contains antimony, arsenic or iron in too great quantities for general use in the arts.

The consumption of manufactured copper in California is large, and I think the day will soon come when a refinery and rolling mill will be demanded. Such an establishment should be situated near San Francisco, to catch the matte and black copper produced in the interior.

## Mountain Rice.

We made some reference a few weeks since, to a kind of wild rice, which grows luxuriantly on uplands in Northern Minnesota. Knowing that it was a valuable article of food, easily cultivated in localities, entirely different from those in which the ordinary rice of commerce is produced, we suggested that the National Agricultural Bureau should take some steps to secure its more general introduction throughout the country, as an agricultural product. We clip the following paragraph from the *Ecaminer* of this city, in relation to the same matter. The suggestions are well worth a careful consideration:

In Maryland and Virginia, a mountain rice has been cultivated, yielding, without irrigation, eighteen to twenty bushels to the acre. In Northern Minnesota it grows wild, and the quantity gathered by the Indians is estimated at over one million of dollars in value. A recent number of that valuable journal, the *MINING AND SCIENTIFIC PRESS* of our city, called the attention of the Commissioner of Agriculture to procuring varieties of the hardy species above referred to, for general distribution. Recently, an invoice of 400 barrels of rice was received in this market from Italy, and was sold at ten cents per pound. This article was raised on the plains of Piedmont, by irrigation.

That magnificent sheet of water called Clear Lake, is capable of furnishing the irrigating supply, needed by a rice crop, for a population of twenty millions. Lake Bigler has a still greater irrigating capacity, and if from any reason our agriculturists dislike to raise rice, by their own or Chinese labor, on the swamp or overflowed lands, the plains and uplands can be made available from the unfailing resources of these magnificent reservoirs.

During the past few years wheat raising has yielded a very small profit; frequently the market has been overstocked, and even now, the good prices realized, are, to a large extent, only repaying the losses of former years. We are now sending wheat and flour to New York and other ports, where they command as follows: The former five cents, the latter 7½ cents, while rice brings 10½ cents. In wheat growing our farmers must compete with the producers of the whole United States; in rice raising only with those of the Southern States. In the latter, the cotton, tobacco and sugar crops will require all the available labor of that section, thus insuring our State a more reliable crop for export, if we engage in rice cultivation, than any other staple we can raise. We have a home demand of thirty-six millions of pounds; in value, nearly two and one-half millions of dollars. We may expect an equal demand for export from the older States; or a total in value of five millions of dollars for an article that it is in our power easily to produce. Let us try.

Fossil Tusk.—Some workmen, says the *Times*, found an immense tusk, last week, while at work between Benicia and Bottle Hill. Being ignorant of its character, they destroyed nearly the whole of it. Dr. Hough, of Martinez, afterwards measured the cavity which it had occupied, and found it to have been over fourteen feet in length and fourteen inches in diameter at the root.

## Mechanical.

## Important Railroad Improvement.

The *American Gas-Light Journal* speaks of the exhibition, at the office of S. A. Beers, Consulting Engineer, 24 Pine street, New York, of an improvement in railroad construction, by which the lateral strength of the rail is brought to aid its sustaining power, and made to carry a portion of the weight of the train. This appears to be accomplished by a peculiar form or arrangement of rail templet, the practical effect of which is to throw fully thirty per cent. of the train upon the lateral strength of the rail, while the vertical strength is taxed no more than is usual—in other words, the tenacity of the rail is increased to the amount of the percentage named. The manner in which this is done is not very clearly set forth, although the advantage, as above, is fully asserted.

If this is so, it is clear that a new element of strength is brought to bear in the sustaining capacity of the rail, by which an important item of cost in railway construction may be greatly reduced. The *Journal* adds:

This principle appears to be destined to settle satisfactorily the important question of the relative economy of iron and steel for rails; as by this plan a steel rail of forty-two pounds per yard is found to be fully equal in strength to sixty pounds in the T rail, when the relative cost of the iron rail of sixty pounds and the equivalent steel rail of forty-two pounds would be as follows for one mile of single track:

24½ tons of iron at \$55.....	\$8,011
65 tons steel rail at \$12½.....	9,900
Increase in first cost.....	\$1,889

Which is less than twenty-four per cent. advance upon the cost of an iron track, which, from well authenticated experience, will outwear the iron more than ten fold.

In the State of New York, all companies organized under the general Railroad Act are prohibited from laying down any iron rail of less weight than fifty-six pounds, and as the thirty-five pounds steel rail of this pattern is amply sufficient for the use of locomotives of eighteen tons weight, it follows that a steel track can be adopted on all roads thus situated, with all its advantages, for less than ten per cent. advance above the cost of the iron track, and thereby more than double the dividends in perpetuity.

It is also evident that the power of vibration possessed by this rail upon the principle of a semi-screw, will absorb much of the strain thrown upon the equipment by oscillation, thus increasing the durability of both the train and rail.

## A WONDERFUL PIECE OF MECHANISM.—

In the Government printing office at Washington, may be seen one of the most wonderful pieces of mechanism ever devised by man. It is a Bullock Patent Printing Press, which prints in one hour 20,000 sheets of sixty-four pages of document matter; while doing this it feeds itself, the paper being in rolls, wets the paper, cuts the sheets, folds them and by a dial attached to the press keeps tally of the number of sheets printed. Of course it is an American invention.

**HOMOGENEOUS vs. FIBROUS IRON.**—When Mr. Bessemer began to manufacture wrought iron from cast by blowing air into the molten metal, it was objected to the product that it had no fiber as common puddle iron had. Experiment and practice have, however, shown that the homogeneous iron is much stronger than fibrous iron. The fiber in puddled iron is the result of intervening layers of cinder finely drawn out and preventing the lateral adhesion of the particles, which thus only adhere end to end; but the particles of homogeneous iron adhere in every direction, and hence its greater strength.

**RULE FOR LUMBERMEN.**—To determine the number of feet of one-inch boards which can be cut from a log twelve feet in length, multiply the number of inches in diameter by half that number, and to this product add two for every fifty of the same—the sum will be the number of feet of boards which can be cut from the log. If longer than twelve feet, add one-twelfth of the whole amount for each additional foot in length.

## REVERBERATORY vs. CUPOLA CASTINGS.—

It is a well known fact that cupola castings are greatly inferior in quality to those cast from reverberatory furnaces; and at Pittsburgh, where bituminous coal is cheap, the castings for machinery, when strength is required, or when strength and lightness are combined, are made only from reverberatory furnaces. Iron foundries who have the means of casting either way, are well acquainted with this fact. Re-melting charcoal iron in a cupola furnace will cause a most marked deterioration, while re-melting in a reverberatory furnace will cause a corresponding increase of strength. A recent experiment in re-melting an iron of excellent quality was found to increase in tensile strength for three re-melts, but at the fourth it began to deteriorate. The same iron, re-melted in a cupola furnace, deteriorated largely at the first re-melt.

The *United States Railroad Journal* calls the attention of railroad men to the above facts, and suggests that the practice of employing car wheels cast from cupola meltings should be dispensed with as a precautionary measure against accident. It is certainly important that none but the best car wheels should be used, for passenger trains especially. Where great speed is intended, the *Journal* suggests that none but wrought iron should be used; but as long as cast iron is at hand, to use none but the best, and those only from reverberatory meltings should be employed.

The same paper further suggests that the managing of railroads is of such serious import to the public that it is a question whether it should not be the subject of legislation, that each and every part of material used in the construction of cars and locomotives, should be inspected by a proper officer appointed for that purpose, as well as a general code for the government of all roads, and a uniform system of signals.

**MECHANICAL USES OF CASTOR OIL.**—Castor oil is said to be the best known oil to soften and redeem old leather. When boots and shoes are greased with it, they do not refuse to receive an after polishing, as when other oils are used. Leather belts for transmitting motion, if kept moist with castor oil, will last about twice as long as when greased with lard, olive or sperm oil. Belts impregnated with castor oil are not so liable to slip as when saturated with other oils. It is said that a 3½-inch belt, when castor oil is used, is equal to a 4½-inch belt when other oils are used. When castor oil is applied, a belt should not be used for at least twenty-four hours. Another advantage of castor oil arises from the fact that rats and other vermin avoid it. These facts are communicated by a practical machinist of Pittsburgh.

**A CHEAP GLASS CUTTER.**—Take an old three-cornered file, heat it red hot, and plunge it into a previously prepared mixture of equal parts of snow and salt, stirring it about so as to cool it as quickly as possible. Then grind the point on a wet stone, preserving the three sides as nearly possible; and it is ready for use. Lay the glass to be cut on a perfectly smooth surface, apply a thin flexible rule, and draw the point of the file quickly over the glass. A little practice will teach one how hard to bear on without fracturing the glass. To insure success it is needful to notch the edges of the glass at the extremities of the scratch. The file can be reground when it becomes dull. Such an instrument will be found serviceable for cutting glass for windows, and all ordinary purposes.

**TO COLOR GOLD.**—Different shades of color are given to ornaments of gold, by exposing them to chemical agents, which dissolve out a portion of the copper and silver alloy, while they have scarcely any action on the gold. The French jewelers possess a number of recipes for giving color to gold, the most common of which is a mixture of two parts niter, one part sea salt, and one of Roman alum. The jewels are kept in a solution of these chemicals, at a boiling point, from fifteen to twenty-five minutes, when they are then taken out, and washed in water, and the operation is finished. The surface of the gold is dull, but perfectly uniform, but can be made lustrous by burnishing. They lose about one-sixteenth of their weight by this operation.

## Scientific Miscellany.

## A Pest in the "Waterfall."

Science, as well as common sense, denounces the deformatory adjuncts now so generally worn by the ladies on the back of their heads. A German naturalist, Lindermann, has published an account of a newly discovered species of *entozoa*, or parasite, which often has its origin in the pediculus or common louse, and which is very often found in the modern appendage to a lady's head-dress. These minute microscopic organisms breed in great numbers on the louse, from which, on arriving at maturity, they migrate to the hair, into the cells of which they enter, and often collect in large numbers, so as to form knots. They also penetrate the tissue of the body, seeking the blood, in which they appear to thrive better than in the tissue. There is reason to believe that they multiply so rapidly in the blood-vessels as to engender serious disease, as the dropsy, asthma, etc. They also breed as parasites upon the hair, where a lack of cleanliness is common. The microscope has revealed to Lindermann as many as one thousand individuals, in their embryo condition, on one-half an inch in length of a single hair!

Numerous experiments have been made with regard to their production, which are of quite too serious a nature to be trifled with. They were found in a large proportion of this class of head gear, taken promiscuously from a fashionable hair-dressing establishment. A number of the infected hairs were placed in felt and exposed to 126° F., for six hours, when the ova showed abundant signs of life! Several hairs were secured upon the neck of a hen, a small place having been shorn of its feathers for the experiment; the hen was confined in a warm place for six hours, when the hairs were found to be covered with *entozoa*! Water heated under pressure to 360° failed to destroy them; but benzole, bi-chloride of mercury, etc., killed them.

Out of thirty samples obtained from a dealer, twenty were found infested with these parasites. Neither drying nor baking the hair destroys the ova. A heat that will destroy them also destroys the hair itself. The hair from which these filthy things are made is chiefly obtained from a thriftless, worthless class of people, who live on the banks of the river Wolga, who are but too glad to part with their hair for the smallest pittance. These experiments are considered to fully establish the fact that the ladies of European cities are wearing upon their heads, perfectly unconscious of the fact, the germs of insect life, which may at any moment spring into vitality, and communicate disease which would be difficult to eradicate, to say nothing of the feelings which, with a knowledge of these facts, must be engendered among sensitive people. Efforts have been made in certain quarters to quiet the public feeling in the matter; but the scientists emphatically assert the correctness of these examinations. Traders are forced to advertise their wares as taken from the heads of respectable people in Germany and France, and not from the filthy Burlakes of the Wolga. Who believes them?

**MUSCULAR TISSUE.**—An essay of interest to microscopists has been published by M. Rouget, in which the author describes several photographs which he has taken of magnified specimens of muscular tissue. He believes that the contractile elements of muscular fibers are disposed in coils, but that this is not the case in the smooth muscle. Much, he says, of the structural features of muscle depends on the direction in which the tissue is torn, and on the mode of preparation.

**TO DETECT WOODY FIBER IN PAPER.**—The paper is touched with ordinary strong nitric acid. If wood fiber is present the paper will be colored brown, especially on warming.

## SPECTRUM OF THE VAPOR OF WATER.—

Janssen, of Paris, has proven, by a series of experiments, that certain lines in the solar spectrum, hitherto termed "telluric rays," and attributed to the presence of water in solution in the atmosphere, are, in reality, the effect of water vapor. When light is passed through a tube filled with water under the pressure of seven atmospheres, it shows the principal telluric rays. Janssen dissents from the conclusions of Kirchhoff, who attributes a portion of the lines in question to potassium. The red and yellow being found more brilliant than the blue and violet in the spectrum of water vapor, the color of the vapor should be orange. This also accounts for the red of the rising and setting sun, or the sun when seen near the horizon.

**TO DETERMINE THE VALUE OF GLUE.**—Dr. Weidenbusch, after finding, by repeated experiments, that chemical determinations will not answer, devised a physical test, which consists in casting gypsum of the finest quality into sticks of mathematically exact dimensions by means of molds, of French chalk. These sticks are saturated with solutions of different glues, and one by one placed in a brass ring having two deep notches to receive the stick; and connected, a lever and glass or iron beaker, into which mercury is poured until the stick breaks; thus the amount of mercury used is the measure of the strength of the glue. The author has not been able to ascertain any relation between the tenacity and the specific gravity of glue. Objection may be made to this method in consequence of the difficulty of obtaining sticks of exactly the same size and saturated by the same quantity of glue; nevertheless the process is said to be more satisfactory than the common chemical process of precipitating gelatin by means of tannin.

**SULPHATE OF IRON ON VEGETATION.**—It is found that if beans are watered with a solution of sulphate of iron they will grow to double the ordinary size, and acquire a much better taste. A like effect is produced in the case of other vegetables. Water kept in a tub with a quantity of old nails in it has been found beneficial for watering purposes.

**METEOROLOGY IN FRANCE.**—The new daily journal of meteorology, now published in Paris, gives in lithograph, every day, the reports received from sixty points in Europe and two in Africa, of the atmospheric condition each morning at eight o'clock, with the addition of the state of the wind the preceding evening. These are on the first page. On the second page, on a little map of Europe, the direction of the winds at these sixty stations is indicated, and a series of lines drawn which show what were the general contours of the great vortexes by which those winds are governed. On the third page of the journal there are discussions on meteorology information. On the fourth page is a series of announcements of the various publications of the Observatory; and lastly, the acknowledgement of the several works received at the Observatory on the preceding day. The publication is a very valuable and useful one. Similar publications should be introduced into other countries.

**AN INK FOR GLASS.**—M. Kessler of France has, by means of fluor-hydrate of ammonia and hydro-chloric acid, properly thickened, made an ink, by which, with any pen, ineffaceable characters can be traced on glass. This ink will be of service to the chemist and apothecary in labeling bottles, and marking graduations on glass.

**SOLVENT FOR FIBERS.**—A solution of copper in ammonia is said to be a solvent for vegetable as well as animal fiber, such as wool and silk. It is capable of so penetrating one kind of fiber with a solution of another as to unite certain of their qualities; for example, enabling cotton to receive and retain the same dyes with woolen, and with a similar tendency.

The divisibility of copper is so great that a grain of it dissolved in an alkali will give a sensible color to 500,000 times its weight in water.

**HEAVY ORDERS FOR CANNON.**—Late English papers say that Krupp, the famous iron worker of Essen, has received orders, within a few months past, for no less than 2,370 heavy cast steel cannon.

**List of Officers of Corporations and Mining Companies.**

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

**INDEPENDENCE QUARTZ M. Co.**—May 6th. Trustees: H. F. Wood, R. C. Beatie and C. J. Klein. President, H. F. Wood; Secretary, F. G. Smith; Business Agent, C. J. Klein; Superintendent, H. F. Wood. Office, 318 California street.

**LONDON QUARTZ M. Co.**—May 4th. Trustees: M. C. Blake, Theo. E. Baugh, W. W. Wiggins, F. DeLong and H. L. Coye. President, M. C. Blake; Secretary, Jno. Crockett; Treasurer, W. W. Wiggins. Office, corner Kearny and Merchant streets.

**SALAMANDER CO.**—May 3d. Trustees: G. W. Smith, Dr. O. P. Warren, D. Ross, E. J. Pfeiffer, H. Gremke, John Speckman and Jas. McComb. President, G. W. Smith; Secretary, E. J. Pfeiffer; Treasurer, Jas. McComb. Office, 210 Post street.

**RECENT INCORPORATIONS.**

April 8th.—Pacific Tannery and Boot and Shoe Co. Place of business, San Francisco. Capital stock, \$100,000, in 1,000 shares of \$100 each. Trustees: Camillo Martin, Daniel Murphy, W. Wolf, S. Bloom and A. Alt-meyer.

May 9.—British Benevolent Society of California. Place of operation, San Francisco. Object, the relief of sick and destitute members. Directors: James Bell, Gomer Evans, Edward R. Highton, Henry Groom, Mathias Gray, Charles Pace, and John Searle.

**BUSSEY'S COMBINATION SAFE LOCK.**—We would call especial attention to the advertisement in our present issue, of this lock. We have already repeatedly noticed it, and every week adds to the number of testimonials which are confirmatory of what we have said about it. The managers of the Bank of British Columbia, after a careful comparison of this with all the other approved safe-locks, have adopted it for their vault. The funds in Amador county treasury are considered by their guardian perfectly secure behind one of them. Good mechanics and practical locksmiths testify to its strength, simplicity and reliability. Among its peculiarities may be noticed the fact that having no figures or other guiding marks upon its face, a bystander could not by any possibility divine the combination, or "set"—however closely he might watch the operator. Again, having no key-hole or other aperture which might serve for the introduction of gunpowder or other explosive, it cannot be blown open. The Sheriff of Amador county pronounces it "the nearest approach to perfection yet arrived at in the art of lock-making." In fact, it seems to be the general opinion that it is the "*Ne Plus Ultra*" of safe-locks. The term, "Burglar and Powder Proof," so often prefixed to safe locks, is, we feel assured in this case, is not a misnomer. A special premium was awarded the inventor at the State Fair of 1866. A sample of the lock can be seen at the office of Markt & Fleishel, No. 18 Post street, or at that of the MINING AND SCIENTIFIC PRESS. The inventor, Mr. W. C. Bussey, can be communicated with at the International Hotel.

**APPLICATIONS FOR PATENTS FOR MINES.** The Mariposa Gazette of May 4th, publishes in due form, notices of intention by L. L. Robinson and Hall McAllister, to apply to the U. S. for patents to the Potts mine, the Oakes & Reese, and the Jones claim, all in Mariposa county, with boundaries as per diagrams filed by them in the U. S. Land Office, Stockton.

**DR. LIVINGSTONE.**—The report of the death of this noted explorer is doubted. Sir R. Murchison has letters from Zanzibar of date two months later than the alleged murder, in which no allusion is made to it. He urges that an expedition be sent for the purpose of settling the matter.

**VIRGINIA COLLIERY EXPLOSION.**—At the New Hope pit, Clover Hill mines, Chesterfield, Va., an explosion occurred on April 4th, killing seventy men—twenty whites and fifty blacks.

**Weekly Stock Circular.**

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 11, 1867.  
CITY STOCKS.

City Stocks are dull, and little or no change has taken place in quotations since our last reference. Some 250 shares of North Beach and Mission R. R. sold at \$49.50@50 per share. A few shares of Cal. Steam Nav. Co. realized 72@71 cent. Seventy shares of Spring Valley Water brought \$67.50@67 3/4 share. This company disbursed its usual monthly dividend yesterday.

**MINING SHARE MARKET.**

The Mining Stock Market continues exceedingly active, but nearly every share on the list has fluctuated materially, and, with a few exceptions, prices are lower than at the close of our last report. Many parties have realized upon their investments to take advantage of the marked improvement noted for a month past, hoping to re-purchase at lower prices. The rapid accumulation of capital in this city, and the gradually declining rates of interest, give great buoyancy to the market, and many are induced to purchase mining stocks who have heretofore kept aloof. The reports from Nevada are very encouraging, and the present large yield from the majority of the claims on the Comstock lode, give confidence to capitalists to make investments. The product of ten of these mines during the month of April amounted to about \$1,150,000—a much larger yield than for the corresponding period of last year.

**HALE & NORCROSS.**—We are informed that the ore taken from this company's mine is improving in quality, and that the average returns during the current month show a value of \$40 per ton. The new shaft, on the first instant, had attained a depth of 301 feet. This stock is firmly held, and for months past no public sales have transpired. A dividend of \$125 per foot will be paid on the 15th inst.

**SAVAGE**—continues to be well maintained, opening at \$3,250@3,200, rising to \$3,450, then selling at \$3,025, ex-dividend, and \$3,245, closing at \$3,225. The ore extracted from this company's mine during the week ending May 4th, amounted to 1,855 tons, giving an assay value of \$71,138, or \$38.35 per ton. The old works produced 69 tons; the sixth station, 137 tons; seventh station, 896 tons, and the Curtis shaft, 753 tons—315 tons of which came from the south mine. It is said that the breasts on the seventh station, both in the north and middle mine, look very well, and yield largely of about \$38 ore. Most of the present yield comes from these points. In the south mine from the second station, a winze has been commenced at a point 150 feet north of the line to connect with the next station, for the purpose of obtaining ventilation. This winze was started north of where the ore was found, and at a depth of 25 feet is said to have reached good ore. A dividend of \$150 was paid on the 8th inst. The bullion receipts in April amounted to \$337,000. They carry over a surplus of \$70,000 after paying the last dividend.

**CROWN POINT**—sold to a considerable extent at a marked decline, gradually dropping from \$1,950 to \$1,530, buyer 5, rallying to \$1,680, and closing yesterday at \$1,775. The east body of ore on the 500-foot level has been opened 25 feet north and south, and is reported to look favorable. The bullion returns of this company during the month of April amounted to \$63,971, and the expenses for the same period are stated at \$50,390. A dividend of \$80 per foot will be disbursed on the 15th inst., leaving a surplus of \$10,000.

**YELLOW JACKET**—advanced from \$1,620 to \$1,750, fell to \$1,590, improved to \$1,690, and closed at \$1,635. We learn that the east drift in the north mine was running in hard blasting rock early in the present month. On the fifth level in the north mine they are drifting south on the east body of ore, and up to the 4th inst. had

worked 80 feet south of the winze, the formation being regular and the bottom of the drift in good ore. From the April balance sheet we extract the following: March balance, \$16,694.49; yield of bullion in April, \$222,075.44; receipts from other sources, \$9,281.19—total, \$248,051.12. Expenses, \$147,455.08; balance, \$100,596.04. The liabilities are stated at \$114,989.04. Ore extracted during April, 6,894 tons; worked, 5,913 tons, showing an average yield of \$37.55 per ton. A dividend of \$50 per share was paid yesterday.

**CHOLLAR POTOSI**—has been the most active stock on the list, receding from \$650 to \$595, rallying to \$631, then selling at \$600@575, and closing at \$520. Advice to the 4th inst., state that the stope in the Blue Wing station continues in good ore. It is said that the old Santa Fé station, as they continue to breast toward the north, exhibits as good a quality of ore as formerly. Three winzes, located 50 feet apart, are now down about 60 feet—all in good ore. During the week ending May 4th, 3,755 tons of ore were sent to custom mills—the Potosi mine yielding 3,303 3/4 tons, and the new shaft 452 tons. The bullion returns for the month of April aggregate \$245,094, leaving a net profit of \$76,785. This result was obtained from the reduction of 8,540 tons of ore, showing an average of \$28.69 per ton. After paying a dividend of \$25 per share a surplus of \$31,074 will remain on hand.

**GOULD & CURRY**—advanced from \$510 to \$590.30, declined to \$572.50, and closed yesterday at \$570. This company's mill has been idle about two weeks for general clean-up and repairs, and it is expected will soon start again. We are informed that they are at present taking about 75 tons of ore per day from the upper levels. The finances of this company are said to be in a better condition than for two or three months past.

**ALPHA**—improved from \$425 to \$490, and at the close \$425 is bid. BELCHER opened at \$440@450, declined to \$370, and closed at \$430 seller 30.

**OPHIR**—exhibited considerable activity, receding from \$440 to \$415, advancing to \$455 seller 3, then selling at \$420@440, and closing at \$435. In the main south drift this company has been steadily making five feet a day, and are now in 160 feet, requiring but ten feet to reach the cross-cut west into the ledge and under the ore in the ninth station. The north drift is in 66 feet, and is said to have reached the clay of the ledge.

**IMPERIAL**—declined from \$274 to \$240, and closed at \$250 b. 10. The bullion received during the month of April aggregated \$95,162.91, and the ore extracted amounted to 4,303 tons—3,319 coming from the Alta mine, and 984 tons from the Holmes mine; amount on hand May 1st, 1,500 tons. The Imperial-Empire shaft is down 885 feet. A dividend of \$15 per share will be paid on the 15th inst. EMPIRE—sold within a range of \$190@195.

**CONFIDENCE**—realized \$67 per share early in the week, advanced to \$88, declined to \$66, and closed at \$68. The bullion returns of this company in April amounted to \$17,131.19; previous month, \$8,438.04. In April, 1866, the yield was \$18,274.86.

**GOLD HILL QUARTZ M. Co.**—During the week under review 22 shares were sold at \$165 per share. The receipts of bullion in April amounted to about \$10,000. A dividend of \$10 per share will be paid on the 13th inst.

**BULLION**—rose from \$50 to \$63, receded to \$50, and closed at \$46. An assessment of \$10 per share was levied on this stock on the 2d inst. OVERMAN, under large sales, declined from \$50 to \$44, and closed at \$47. SIERRA NEVADA sold at \$12.50@15. EXCHEQUER at \$10@12.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,831,325.

**THE SUTRO TUNNEL.**—It will be recollected that the capitalists of New York have promised that as soon as California capitalists shall raise \$500,000, to add to that amount \$4,500,000, to make up the five millions required to put this great work through. Up to the present time \$365,000 have been subscribed, as follows: The Savage company, \$150,000; Gould & Curry, \$100,000; Hale & Norcross, \$100,000; Empire, \$15,000. The New Yorkers, and other friends of the tunnel, are now waiting for Yellow Jacket, Crown Point, Chollar-Potosi, Ophir, Mexican, and other companies. Only \$135,000 more is wanted to ensure the execution of this great enterprise. It is to be hoped that the amount will soon be forthcoming, to the end that the work may be pushed forward with all possible dispatch.

**New Patents and Inventions.**

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

**PATENTS RECENTLY ISSUED.**

33,218.—METHOD OF OPERATING RAILROAD SWITCHES.—Gilbert M. Cole, Folsom City, Cal.:

I claim, 1st, The mechanism, herein described, for rendering a railroad switch absolutely self-adjusting as the train approaches it on either branch of the double track, in combination with the mechanism herein described, by which the engineer can render the switch self-adjusting as the train approaches in an opposite direction.

2d, The levers, b, b', the pinion, a\*, the sector, d, shaft, c, and crank, c', in combination with the levers, a, a', pinion, a, sector, d, and the loose wheel, b\*, on the shaft of the locomotive truck, all constructed, arranged, and operating substantially as described.

33,365.—APPARATUS FOR CONCENTRATING AND CONDENSING VOLATILE METALLIC SUBSTANCES.—Joseph C. Coult, San Francisco, Cal.:

I claim, 1st, The arrangement of the furnace having fire on two sides, and the openings leading to the ore-chamber, substantially as described and for the purposes set forth.

2d, The soot and spark chamber and the dry compartments, having a continuous supply of cold water surrounding them to hasten condensation and concentration of volatile mineral substances as described, substantially as and for the purpose set forth.

3d, The combined arrangement broadly, as an improvement upon the Coult & Roach concentrator and condenser for the reduction of quicksilver, ores, and the use of steam or water to produce draught to accomplish all substantially in the specification described and for the purposes therein set forth.

63,424.—COMBINED PLANTER AND CULTIVATOR.—Ansel Wallace Putnam, Suisun, Cal.:

I claim, 1st, The apparatus for furrowing for and covering the seed, consisting of the marker, S, the diverging plates, T, T, and the converging plates, V, V, combined and arranged substantially as described.

2d, The wheel, D, and bent arm, E, together with the sliding-plates, L, L', and the regulating slide, P, for dropping the seed, constructed and operated substantially as described.

3d, The rocking-chair attached to the frame and the hinged arms, h, h, for the purpose of raising and lowering the frame, substantially as described.

The object of this invention is to provide an improved planter and cultivator, so constructed as to plant with great regularity and dispatch. By its use a furrow for the seed is made, the seed dropped and covered. The machine is so constructed that the marker can be made to run lightly over the ground or caused to enter it more deeply, as the driver throws his weight forward of the axle or behind it; or the marker can be raised and secured, so that it will not touch the ground. The planting mechanism may also be thrown out of place, at will, so that the machine may be the more readily transported from place to place.

**Allen's Lung Balsam.**

Remarkable cure of the daughter of Robert Lawrence, Esq.:

Newport, R.I., June 1, 1863.—Gentle:—I will give you a statement of the wonderful medicinal properties of ALLEN'S LUNG BALSAM. My daughter was attacked with a cold, which settled on her lungs. A severe cough was the consequence, which so harassed her that she became much reduced. She had great pains in her side and breast, attended with cold chills and night sweats. She raised mucus from a pint of matter a day. Finally her lungs became ulcerated, her hands and feet were cold and clammy as death. Her physician, having failed to give any permanent relief, said that he could not do anything more for her; that she must soon die. At this time I procured Allen's Lung Balsam, which caused her to raise large quantities of matter and phlegm. When this was expectorated, her appetite and strength gained rapidly, and her cough in a short time ceased, and now she is as usual. It is a wonderful trophy of the medicinal properties of Allen's Lung Balsam.

Respectfully yours, ROBERT LAWRENCE. Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.

Sold by all Medicine Dealers everywhere. 18x14-1m

**Perry Davis' Vegetable Pain Killer,**

After a thorough trial, by innumerable living witnesses, has proved itself the Medicine of the age. Although there have been many medicinal preparations brought before the public since the first introduction of Perry Davis' Vegetable Pain Killer, and large amounts expended in their introduction, the Pain Killer has retained its superiority. The effect in the estimation of the world as the best Family Medicine ever introduced. It is an internal and external remedy. The positive proof of its efficacy, is that the sales have constantly increased, and upon its own merits. The effect of the Pain Killer upon the patient, when taken internally in cases of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy in cases of Burns, Bruises, Sores, Sprains, Cuts, stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an almost infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

Sold by all Medicine Dealers everywhere. 18x14-1m

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Alpine Miner* of May 4th: We learn that no difficulty was experienced in working the Tarshish ore at the Ophir mill. Eighty-eight per cent. of the fire assay was the result. The 3½ tons worked \$1,203, instead of \$1,050, as at first reported by telegraph. All Alpine is delighted.

The Pittsburg Co. have let a contract on their tunnel for 100 ft., and will prosecute the work with vigor to the opening of a payable ledge. This company purchased and located six parallel lodes crossing the head of Scandinavian Cañon, last year.

We notice this week that work is being done on the Slate lode, the Home Stake tunnel, the Arizona claim, the Ringold & Goldfinch tunnel, and the Diamond lode, now locations, and the Sam Booth, Mowyer and Evening Star, old claims. The Schenectady Co. are still at work on their ore house.

## Calaveras County.

From the *Copperopolis Courier* of May 4th: The new ditch from the Big Reservoir, Salt Spring Valley to Quail Hill, is to be completed within 60 days.

The *Chronicle* speaks of a 14-oz. nugget found a short time since in the vicinity of Mokelumne Hill.

The *San Andreas Register* says: Everybody has "Cat Camp" on the brain.

## El Dorado County.

From the *Placerville Courier* of May 4th: From all quarters we get cheering news with regard to prospecting for gold. At Georgetown, this season, there will be a vast amount of work done with certain reward—for the work already done reveals the fact that the mines are rich in gold. In this vicinity, a great amount of work is being done. Although there is no excitement about mining, yet there is sufficient proof to convince us that there is no end to the mineral wealth that only awaits the stroke of intelligent industry. Capital is coming forward to assist in prospecting the mines; mills are being built; every day there are discoveries that if made in some remote region, like Montana, would draw thousands.

The Nevada mine is about half a mile from the Shepherd, and supposed to be on the same lead, in Poverty Point District. Messrs. Noyes & Clark have one shaft down 30 ft. on a ledge 4 ft. wide, which prospects very rich. They have another shaft of 40 ft., which they were obliged to abandon, on account of water, a short time since.

From the *Democrat* of same date: We were shown, a few days since, 200 ozs. of gold dust, well retorted, taken from the claim of Messrs. Norton & Stillwagon, at Brownsville, in this county, the result of 29 days' run of a 5-stamp mill. George W. Swan & Co.'s is another of the promising Brownsville claims.

## Fresno County.

A letter from Buchanan Hollow to the *Mariposa Mail* of May 4th, says: The Buchanan copper mine is in successful operation. The greatest depth sunk is 146 feet, and the vein is about seven feet thick, and well-defined. Other companies are expected to commence operations soon. A sale of interest in the Buchanan has recently been effected for a large sum. At James' Ranch the Green Mountain Co. have taken out considerable ore from their vein; their smelting works will soon start and rich results are anticipated. The German Co., which claims 4,250 ft. of the northwesterly extension of the Buchanan lode, are to hold a meeting on Monday, May 6th, for the purpose of commencing work on their claim.

Letter from Millerton to the *Visalia Delta* of May 1st: Some important discoveries of placer diggings have been made on Franchio Creek, where as high as \$15 to the hand is realized. Some 40 claims are already staked off. Other diggings are paying from \$4 to \$10 per day.

## Kern County.

From the *Havilah Courier* of April 27th: Williams, Rogers & Co., Dahlonga Dist., are down 50 ft. in their second shaft on the Rupert lode, which is from six to seven ft. wide. The Bob lode is also showing well, and all the mines in this district are increasing in size and richness. Davis & Co.'s mill will be running in two weeks.

## Mono County.

A correspondent of the *Sacramento Union* writes: There will be perhaps 100 tons of first-class ore shipped from here this spring to San Francisco that will pay from \$800 to \$1,200 per ton. Dr. Partz, of the Cornucopia Co., has just shipped to San Francisco, by the way of Aurora, Nev., 9,273 lbs. of bullion, which was realized out of about 20 tons of ore.

## Nevada County.

From the *Transcript* of May 2d: The one-fifth interest in the claim of Mull, Evans & Co., which was sold a few days since for \$10,000, could not now be bought for \$15,000. A very rich strike has been made in the claim since the purchase.

From same of 7th: At the bottom of the incline, 200 ft. below the surface, in the Cunningham mine, very rich rock has been found. Last week, 16 lbs. of this quartz, worked by mill process, yielded \$2. Men are engaged in drifting in the upper and lower level of the mine, and all the rock taken out is of excellent grade.

Same of 8th: The Russian mine on Manzanita Hill, Bridgeport township, is owned by three men, and five hands are employed in working it. At the last clean-up, after a four week's run, they got \$1,900, giving a dividend of \$300 to each of the owners, after paying expenses.

The English Co., at Badger Hill, near Cherokee, are washing on the blue gravel channel. They employ 20 men, and at the last clean-up averaged a profit of \$5 per day to the man.

The French Co., at North Bloomfield, is working 22 men. After a run of five weeks they took out \$7,100.

From the *Gazette* of May 3d: The flume claims in Little Deer Creek are now owned by W. K. and A. G. Farnham, H. W. Butterfield and Chas. McElvey, who are taking out from \$100 to \$300 a day—the yield last Tuesday reaching the latter figure.

Same of 4th: The Hope Gravel Co., working the gravel claims at Alta Hill, has leased the Larimer mill, to crush their cement.

The mill of Black & Young is the only one in Eureka township, which has been kept running with any regularity during the winter. The Eagle Co.'s mill will start on Tuesday.

Same of 6th: Messrs. Evans, Stidger & Co., owners of the claims on Buckeye Hill, near Sweetland, cleaned up last week, and took out \$19,650.

Same of 7th: Kevelin, Burke & Co., recently commenced the work of developing the Vanderbilt ledge. They have an incline down about 25 ft., disclosing a well defined ledge of 12 to 15 in. in width.

From the *Grass Valley Union* of May 1st: The prospects of the Consolidated mine are daily brightening. Two men took out five tons of quartz on Monday. A 10-stamp mill will probably be running within the next six weeks.

Same of 2d: Pumping and hoisting machinery is to be at once erected on the Home-bound mine. The engine will be of 30-horse power. A new incline will be sunk.

The Union Jack rock, now being crushed at the Ione mill, is giving an average yield of \$14 per ton.

Machinery will be placed upon the La Crosse mine in a few weeks.

EXCELSIOR.—From the *Transcript* of May 5th: The snow is melting rapidly at Meadow Lake, and at last report was only 9 ft. deep. The Mohawk, Grant, Golden Eagle and California mines are all being worked with energy. The Grant mill is crushing, and the Golden Eagle will start up in about ten days. The California has been worked by shaft from 90 to 100 ft. At this depth the ledge is 9 ft. wide, with clearly defined walls, and the rock assays \$170 to the ton. The first of June will be early enough for those who desire to examine the mines to visit the district.

A letter from Judge Tilford to the *Enterprise* says: The Golden Eagle rock looks splendidly. The ledge on the Knickerbocker lode is more than 8 ft. wide at the depth of 80 ft. The California mill will start shortly. The Excelsior Co. resume work in May, and are confident of success. The Mohawk and Montreal shaft has exposed a ledge more than two feet wide of excellent ore, at a depth of 250 ft. below the apex. The mill has not been injured by the winter storms; the machinery is all housed, and milling will commence very shortly. The Gold Run Phoenix is now and has been at work on its tunnel through the past season. The ore is looking really rich. An assessment of \$1 per share was levied a few days since. The Comet Co., Shooting Star ledge, are preparing for work. The Grant is crushing rock that yields from \$40 to \$50 per ton. The Kentucky claim prospects finely. The Enterprise Co. are getting ready to put up new machinery, and are sanguine of success.

## Plumas County.

From the *Herald* of May 4th: No crushing will be done for some weeks in the Harpending mine, as the mill is to be removed to a more eligible position lower down the hill.

A difference of opinion seems to be expressed in regard to the Green Emigrant. A positive friend of ours who has lately visited it, declares it "the richest thing in the State."

The Nevada *Transcript* says a largo force of men is still employed on the Harpending in taking out ore.

Colfax letter, May 3d, to the *Dutch Flat Enquirer*, says: The Rising Sun Co. will soon commence operations on a large scale, and it is said that the old Live Oak has changed hands and that extensive works will be erected by the new company this season. \* \* \* Placer mining has about ceased. Walker & Co. are yet making about one oz. a day, but their water is rapidly falling.

## Plumas County.

From the *National* of April 27th: The Greenville ditch is now near completion, and we may expect to have large shipments of gold from Indian Valley. The new diggings are of great extent, and prospects 25 cts. to the pan. There will be employment for at least 200 miners the coming season. Mr. Westcott, who represents a New York Co., will commence operations on the Kitts' mine immediately. He has engaged one of H. C. Bidwell's mills for the time being. We were lately shown at the office of the Caledonia Co., some of the richest quartz rock ever produced in this county. The mine is wide. The mill gives fine results. Mr. Aschheim has sold his third of the Lone Star quartz mill to H. C. Bidwell.

## Shasta County.

From the *Courier* of May 4th: The Mammoth Co. have decided to remove the mill to the Harrison lode without delay.

Dosh & Jollie will commence a run on rock taken from the Jollie lode, on Monday next. The quartz selected prospects very rich.

The Potosi Co., at Muletown, have discharged their superintendent and most of the workmen, and will hereafter work the claim on a more economical plan.

Peck's quartz mill will soon be removed from Copper City to the Pacific claim, at South Fork.

The reports from South Fork mines are all encouraging. Work is being pushed rapidly ahead on the Chicago, Crystal and other claims. The Chicago has commenced sending ore to San Francisco via Red Bluff.

## Sierra County.

From the *Downville Messenger* of May 4th: The Boot Jack claims, located on Gishon Creek, formerly known as the Snyder claims, are turning out immensely rich, gold in large quantities being visible in the dirt. The claims are owned by Barret, Welch & Co.

Letter to same from Morristown: Our ditches are running full of water, and mining has commenced in real earnest. The American Co. has had considerable trouble with its ditch, but no serious breaks. The American Co. is working about 40 hands, with some room for more, but it has made no clean-up. Parish & Co., of the Union & McGee Co., are removing the snow from their diggings.

## Tuolumne County.

From the *Columbia Citizen* of May 4th: Among the claims now being worked at Knapp's Ranch, are those of Peabody & Arnold; Morrison & Sullivan; Hunt & Ryan; (formerly the Black claim); Hagarty & Wolf; D. Coffron; and Burgel & Co.

At Yankee Hill, there are some 14 claims which are paying fair wages, and some of them, perhaps, a little more.

The Shanghai quartz claim, in this precinct, employs 15 hands—has a 10-stamp mill—and is considered one of the best claims in this vicinity.

## Yuba County.

From the *Appeal* of May 3d: Our Brownsville correspondent writes May 2d: Confidence is reviving every day. The Sweet Vengeance is preparing for a new start. The Rattlesnake (old Yuba) resumed work a week ago, and things look encouraging. The Dannebroge is repairing their machinery. The Pennsylvania has a full supply of good quartz for their 16 stamps. The Jefferson machinery will be repaired to-day, and it will soon start its twelve stamps on good quartz. At the bottom of its shaft, at a depth of 550 ft., is now found very coarse gold, and within the last few days a great many pieces of pure gold, some of them worth from \$4 to \$6, have been picked up.

Camptonville letter to same: B. P. Hugg cleaned up a portion of his sluice, the other day, and realized \$1,500. Clow & Hendricks have sold their entire interest in Brandy creek to a company of Chinamen for \$4,500. The Nevada Co., at Garden Valley, has this winter had two dams swept away and their claim covered with tailings; but the claim is again working.

## ARIZONA.

The *Bulletin* has a letter from Wickenburg, dated April 4th, from which we quote: The new 20-stamp mill of the Vulture Co. has just been completed upon the Hassayampa, half a mile north of this town. It

is a fine large adobe building. The engine (50-horse power), boiler, stamps, and, in fact, all of the machinery of the new mill, were manufactured by the Union Works of San Francisco, and are a complete success. The whole twenty stamps commenced working yesterday, without a single fault or breakage, and a new Blake's crusher will go into operation before the close of next week. The ten stamps hitherto worked crushed eighteen tons per day, averaging a yield of \$50 a ton, the surface and shaft ore proving equally good.

It is expected that the 20 stamps will crush 40 tons per day, turning out \$2,000 every 24 hours. Thus far, no sulphurets or refractory ores of any kind have been discovered. Jagar & Co., of Fort Yuma, have now a contract for transporting the ore from the mine to the mill, over a new road 14 miles in length, at about \$10 a ton. The cost of extracting the ore from the mine is about \$5 per ton. Wood is furnished at the mill at from \$5 to \$7 per cord. At the mine I found 2,000 tons of ore awaiting transportation. Twenty odd men are constantly employed at the mine.

## BRITISH COLUMBIA.

From the *Cariboo Sentinel* of March 30th: The greater number of claims would have been working before this but for the want of water, which a continuance of this fine weather will soon supply. The mining season of 1867 gives promise of being the most interesting and prosperous that has yet been experienced in Cariboo.

In Stout's Gulch, the Alturas Co. are running a tunnel, working 12 men; they took \$640 out of the dirt from two small sets of timbers, they are now sinking a shaft to the main tunnel. Jenkins Co. worked all winter; in running a side drift they found a prospect of \$17 to the pan. Muchoro Co.'s ground pays \$40 per day to the hand; they are waiting for water. The Home Ticket, in Conklin's Gulch, has struck fine prospects.

In Grouse Creek, the Heron Co. paid \$800 dividend to the interest last week. The Black Hawk Co. expect to be taking out pay in a short time. The Full Rigg Co. paid \$200 dividend to the interest last week. Several new claims have been taken up on this creek since the Bed Rock Flume Co.'s charter has been revoked.

The Blythe Co. on Lightning Creek are preparing to take out pay. The Burns Co. on Burns Creek, are waiting for water.

On Cañon Creek, the Stewart Quartz Co. have quit working. The Washburn Co. sunk a shaft 62 ft. deep on their ledge, and found some of the richest quartz that has ever been seen in this district. Two arrastres will be erected.

## COLORADO.

From the *Denver News* of April 17th: Mr. Banks, of Nevada, has discovered a valuable lode of gray copper, rich in silver, near Mount Vernon.

We learn from private sources that the Grass Valley Hydraulic and Mining Co., are about to resume operations in Clear Creek county. Some competent engineers, experienced in this kind of mining have lately examined it and pronounced it one of the richest placer regions in the world. We have thousands of acres scattered through every valley in the mountains which will produce from \$2 to \$5 in gold per day, per man, when properly worked. The money which developed the Bobtail, Gregory, Gunnel, Burroughs, Missouri, Bates and other prominent ledges in Gilpin and Clear Creek counties, came from these now neglected mines; and we will welcome again the day when the long tom, sluice box and rocker are again in use.

Mr. L. C. Shields has just returned from a trip into Snake River and Peru Mining Districts. All the mining camps are deserted, and in the valley of the Snake the snow is about five feet deep.

## IDAHO.

From the *Owyhee Avalanche* of April 20th: The Oro Fino and Morning Star Co., and the Sands Co. have completed a contract of consolidation for mining purposes on the Oro Fino mine. During next week some preliminary labor will be done about the works, so as to have everything in order to put on a force of miners to take out ore by May 1st.

Reports from Lemhi are "mixed." An extract from a letter to Geo. Knowlton, dated Leesburg, March 10th, is as follows: It has snowed here most of the time since October. \* \* \* As for the mines—my opinion is, that many a man will curse the country. For my part, I shall get out of here as soon as I can get a horse and a little grub. A color of gold sets these pilgrims crazy. Chit. Davis and another man have been prospecting for two months, and have not been able to raise a cent to the pan yet; and I will bet they have sunk 50 holes in different places. From same of 27th: It is understood that

a force of men will be put at work on the Oro Fine next Monday.

Frank Almon and partner have struck a ledge between the Woodstock and Hays & Ray.

Whisky ledge has been opened in a new place east of the Miner mill, and a vein of two feet of good looking quartz found.

Several companies of Chinamen are at work in Flint Gulch.

An opening of 20 ft. in length on the Silver Cord, shows a large belt of very rich ore. The Vulcan still presents encouraging features. The Hays & Ray tunnel is going Poormanwards quite rapidly. But little blasting is necessary. The workmen are now nearly 650 ft. from the mouth of the tunnel. The ore is improving in quality as the work advances. The vein is perfect. The main shaft on the old Poorman works has been started down to strike the tunnel 250 ft. below. The shaft on the New York will reach the depth of 80 ft. in the course of the week.

From the Boise City *Statesman* of April 11th: In Cottonwood Gulch, above the Garrison, two men in four days last week, washed out \$76. It is believed that another year these mines will justify the bringing a ditch from Boise river. The gold is equal in quality to the Placerville dust.

From the Silver City *Bullion*: The new tunnel in the Hays and Ray claim, an extension of the Poorman, has been pierced to 600 ft. in depth, and fabulously rich ore has been struck.

From the Idaho City *World* of April 20th: Active mining operations were commenced on Moore's and Elk creeks, and on Bonum Hill, opposite this city, early in the week, and in some of the hill claims the work is prosecuted night and day, with hydraulic force. In a week or two more the mines in every portion of the Basin will be ready to work. This year some placers will be worked for the first time with water from newly made ditches. There are vast tracts all over the Basin which have never been prospected, but which will doubtless prove as rich as any of the diggings about here.

Work has commenced at Pioneer. By next week nearly all will be busy. A very rich vein has been struck in the Elkhorn mine, from which about 200 tons of fine ore is already taken out. The mill has been crnshing for a week or more, and a big clean up is expected.

A letter dated Rocky Bar, April 12th, mentions the discovery of another vein in the Bonaparte Hill mine, from which some very rich ore has been taken. A very prosperous mining season generally in that district is anticipated.

Gold Hill Dist., 25 miles from this city on the other side of the divide which hems in this Basin, and the adjacent district, of which Banner City is the camp, promise to be of much importance during the season just opening. Dooley's ditch, from Crooked river is completed.

Letter from Leesburg, dated March 25th, says: Mining has not commenced here yet, and things do not look much like it, the weather being very cold and snow very deep.

#### MONTANA.

From the *Post* of April 20th: Mining matters are looking up on Confederate Gulch. Hillis & Co. have been taking some rich pay dirt out of their claim, at the mouth of Montana Gulch, taking out from \$95 to \$188 to the pan. They found one nugget weighing \$312. A nugget weighing \$100, was taken out of Boulder last week. Williams & Co. have found some very rich paying ground in their claims adjoining. They are engaged in erecting a derick. Aht & Co., next below, have been on good pay ever since last July. McCarty & Co., first claim above discovery, feel confident that their ground is good. Mayor Shoup, at Red Mountain, will have his mill in running order on May 1st. Harvey & Co. have made a rich quartz discovery on Coolie's Gulch.

Messrs. Fisher and Postlewait have leased the Excelsior mill, and will have it running by May 1st on rock from No. 1 on the Kearsarge.

The 15 600-lb. stamp of the Hawkeye mill are all at work on Kearsarge rock, which yields on an average, \$30 per ton. The cost of working it, including the mining, is \$7 per ton.

Work on Last Chance and adjacent gulches is slowly getting under way. The Christenot mill sent in yesterday, 60 ozs. of retort. Col. Postlewait deposited some 50 ozs. from the Hawkeye. The former is still short of water, and the latter working from top rock.

Messrs. Nowlan & Weary have received in bank 400 lbs. of bullion slabs from the last cupellation of the Legal Tender ore. As an evidence of the richness of the rock, we may state that the St. Louis and Montana Mining Co. offered Mr. Esler \$50,000 for 50 tons of the rock. This is \$600 per ton in gold.

At Red Mountain, Highland, the Ballarat ranks first among the ledges. The quartz is decomposed, yields by assay \$141.50 per ton, and has, at a depth of 50 ft., a 28-ft. crevice. The Nevins lode, southwest, is very rich, \$25 per day having been made by crnshing with a hand mortar. There is on it a 40-ft. shaft, showing four feet of crevice.

The mill of the Ragland & Cope Co., at Hot Springs, is crnshing 20 tons daily from the Gold Hill lode. The leads of the company are developed as follows: Poney Discovery—shaft, 135 ft.; crevice, three feet; yield, \$85. Gold Hill—shaft, 60 ft.; crevice, three ft.; yield \$40. Asop—shaft, 30 ft.; crevice, five ft.; yield, \$30. Excellence—shaft, 20 ft.; crevice, 2½ ft.; yield \$50. Oriental—shaft, 60 ft.; crevice, six inches; yield, \$40. Oriental Extension—shaft, 25 ft.; crevice, three ft.; yield, \$40.

From the Helena *Gazette* of April 13th: Things are lively in Washington Gulch. The latest reports from Engle Creek are encouraging. From several of the shafts sunk on the streak where they have again struck pay below the rich deposit first worked out in Montana Gulch, as high as \$100 to the pan has been obtained.

From Lost Horse reports are most encouraging. The miners are making preparations for early operations.

#### NEVADA.

##### Black Rock.

The Susanville *Sage Brush* of April 13th, says: We have just received the result of a number of tests of Black Rock ore, made for the Chico Co., by Mr. Charles Insensbeck. The Emerald ledge, which he describes as Plata Verde, or green silver ore, yielded at the rate of \$238 per ton. From a piece taken from the wax deposit on the Buokeye, which he calls chlorido or horn silver, he obtained the enormous result of \$9,329 per ton. He made a second test which varied but little from the first.

##### Esmeralda.

From the Aurora *Union* of April 27th: On Last Chance Hill, Mr. Arnold took out four tons of ore, which produced 320 ozs. of bullion. Eighty ozs., the battery bullion, have been assayed, giving an assay of \$10.25 per ounce.

Six hundred and fifty pounds of bullion from the Rockingham claim, at Hot Springs, was brought as far as the race course by Mr. Hanson, when he was compelled to abandon his conveyance on account of the snow. He chartered a train of Pintos to bring in the treasure. From Mr. Hanson we learn that from a chamber in the mine 30 ft. long, from three to ten ft. wide, there has been near \$10,000 worth of ore taken out in the last few months, and the mine is now looking well. The Cornucopia and other mines in the immediate vicinity all look well.

From the Gold Hill *News* of April 29th: The discoveries in Washington Dist. are becoming excitingly rich. We have before us two assays made by Edwards & Wiegand, of ore from two different ledges in that district; one is from the Mary Ann ledge, and contained \$905 in gold and \$174.75 in silver—total \$1,083 per ton of ore. Another assay, from an adjoining ledge, yielded in silver at the rate of \$578.80 per ton.

From the *Enterprise* of May 4th: Eighteen tons of Midas ore, Pine Grove, worked at Wheeler & Penrod's arastra mill, yielded \$710, or nearly \$40 per ton. The lead is about four feet wide at the point where it is being worked. The Grand Deposit is in the same vicinity and near the Imperial. A lot of 4,700 lbs. of surface rock from it, worked at the same mill, yielded \$157.59.

##### Humboldt.

From the *Register* of April 27th: In the North Star mine, great progress has been made in the last two months. The shaft shows an exceedingly fine and rich vein of silver ore. The tunnel now being run will cut the vein some 250 ft. below the surface.

One year ago last fall work was commenced on the Bullion, and a tunnel run in 100 ft. From the end of this tunnel a drift was run 40 ft., and the ledge not being found, work was suspended, and the mine has since been idle. By another season the railroad will be completed to within five miles of the mine, when we may expect to hear of the Bullion being added to the list of producing mines of Humboldt. The stock of the company is chiefly owned in the East, and but few of the stockholders have any correct idea of the value of the property they own.

The old Star City mill is being torn down and moved to the new site. Additional machinery is to be purchased at once and erected without delay.

The Montezuma Smelting Works are in operation in all departments, smelting, calcining and refining. Thirteen tons of ore are consumed daily, yielding over 60 per cent. crude bullion, which goes into the refining furnaces. Over 100 tons of bullion

have already accumulated. We understand the castings for additional refining furnaces have left Cisco, and will be there next week. A fire occurred at the mine last week, destroying the Montezuma house and all its contents. The house is to be rebuilt at once.

Considerable excitement has prevailed in Star City, during the past week, on account of the discovery of gold, in considerable quantities, in the bank of Star creek, at the foot of the Yankee hill.

Same of May 4th: The Montezuma mine, Arabia Dist., yielded during April over 300 tons of ore, all of which has been reduced at the smelting works of the company at Oreana. The ledge shows a solid body of ore from wall to wall, 18 ft. in width, and not a pound of waste rock. The company has only one set of furnaces in operation, which produced during the month of April over 200 tons of metal, in value over \$35,000.

Mr. Torrey will, we understand, be ready to fire up his furnaces in the course of 10 days. He has some \$150,000 worth of ore in sight.

The Nevada Silver Mining Co., in Arabia Dist., has leased its mill to parties from Gold Hill, who are opening the Chloride ledge, a short distance north of the Montezuma. Assays from this mine have yielded over \$500 per ton.

The Trinity & Sacramento Co., at Oreana, shipped this week 847 ozs. of bullion, valued at \$1,016.

##### Pahranaagat.

From the *Reveille* of April 29th: A Pahranaagat letter, dated 17th, says: The Illinois is, beyond a doubt, a superior lode; there is plenty of \$120 ore in a wide vein. A number of companies have been organized for operations here. The Pioneer and the Crescent Co's have each a 5-stamp mill. The Pahranaagat Valley Co. has a 10-stamper on the ground. The Montauk Co. has expended some \$18,000, and is now at work on the Ocean lode. It erected a furnace and tried to smelt the ores, but it proved a failure and was abandoned. Two English companies are organized, and will commence soon to develop their lodes.

##### Reese River.

From the *Reveille* of April 27th: W. G. Blakeley's 5-stamp mill, in Reveille Dist., has been running for several days with success. Ore from the Mohawk and Green Mountain locations, belonging to the mill company, although the pulp was not tested, is estimated to have yielded at the rate of \$240 per ton. The Bullion Co. is working several of its ledges, and its Fisherman claim is producing ore of marvelous richness.

From same of 29th: A thousand pounds of ore from the Amazon yielded in the Keystone mill at the rate of \$274 per ton. The ledge is 15 ft. wide.

The Fisher ledge, in Milk Springs Dist., shows beautiful mineral at the depth of 10 ft. The stage on Saturday brought \$5,087.57 bullion from the mill of the Belmont Co.

There arrived yesterday 3,367 ounces of crude bullion from the mill of the Social and Steptoe Co., Egan Cañon.

From the Silver Bend *Reporter* of April 27th: The Rutland mill, in Reveille Dist., is producing bullion at an astonishing rate. Most of it, about 1,000 ozs., has been forwarded to Austin; but Mr. Nelson brought a little to this place (Belmont) on horseback. It produced a bar weighing 66½ ozs., 947 fine, and containing \$80.99 in silver and \$4.16 in gold.

The Holland ledge, in Manhattan Dist., is 25 ft. wide upon the croppings, and assays \$265.35 in silver to the ton. The Great Western is from 40 to 50 ft. wide, and assays \$174.23. Both of these ledges have an enormous quantity of surface ore in sight that will pay for milling. They are situated about 20 miles from Belmont.

The Ophir assays \$263 in silver and \$3 in gold to the ton.

The Great Salt Basin Co., at Silver Peak and Red Mountain, has without doubt the finest mining property owned by any single corporation in the world. It comprises a series of magnificent silver-bearing veins of extraordinary richness, as well as includes many gold-bearing ledges that in magnitude and the wealth of treasure they exhibit are the astonishment of all who behold them. The company has two mills already, one of ten stamps and another of three.

The Rigby mill, at San Antonio, has been for some time at work upon ores from Potomac Hill in that Dist., and from the Scorpion ledge, Reveille Dist. Last week, bullion amounting to 4,337 ozs., produced by the mill, was forwarded to Austin for melting and assay.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of May 2d: The aggregate advance in the price of feet in Virginia and Gold Hill Dists., in the last 30 days, has been nearly three millions of dollars. Many of the prominent mines are yielding magnificently, and the indications are that the bullion product of Storey county for 1867 will exceed the yield of 1866 by several millions of dollars.

From same of 3d: Much work is being done in Devil's Gate Dist. on claims that have lain idle for the past three or four years. Those who first worked the claims of the district wanted ores worth \$100 to \$250 per ton or nothing, but the present workers are only looking for ore worth \$25 to \$30 per ton, and they are finding it.

Same of 4th: From the office of Wells, Fargo & Co., in this city, there were shipped during the past week, 7,781 lbs. of assayed bullion, valued at \$253,296.20; from their office in Gold Hill, 6,730 lbs., valued at \$185,906.43.

Same of May 5th: Dall's mill, at Ophir, Washoe Valley, which was destroyed by fire some months since, is now being rebuilt. The mill will contain 60 stamps—part for wet and part for dry crushing—and there will be six roasting furnaces, with barrels for amalgamating, etc. Both water power and steam will be used in driving the machinery. The entire capacity of the mill will be about 120 tons per day. It is intended to have the mill in operation by the first of June.

We saw yesterday a brick from Imperial ore. It weighed 2,112.40-100 ozs.; gold, 361.5 fine; silver, 638 fine. Value—in gold, \$15,785.55; in silver, \$1,742.51—a total value of \$17,528.06.

From the *Trespass* of May 3d: The Crown Point lift-pump yesterday morning, was started in motion. In a few days the company will be able to resume work in the lower drift, west; such a large body of water having been struck some time ago that all work was stopped at the 500-ft. level.

Yesterday, in the matter of Wm. B. Thornburgh vs. Savage Gold and Silver Mining Co., the jury returned a verdict for defendant.

From the Gold Hill *News* of April 29th: There is, perhaps, more ore being milled and more bullion taken out at this time, than ever before in the history of the State. Every available team is pressed into the service, and all the mills are pounding away as though they were trying to make up for lost time.

At the new shaft of the Hale & Norcross, the works are progressing rapidly. They will be the most complete on the whole line of the Comstock. The new shaft is down 300 ft., and although the rock is hard, they sink 22 ft. per week.

**CHEAP TELEGRAPHING.**—The experiment of cheap telegraphy has been made in Belgium with the most gratifying success. The telegraph in that country is controlled by the government. There are 307 telegraph offices open for the public, 2,000 miles of length of lines, and 5,400 length of wires. From 1850 to 1862, the tariff was fixed at thirty cents for twenty words. From 1862 to 1865, the tariff was reduced to twenty cents. Since 1865 it has stood at ten cents. For 1860 the total number of messages sent was 80,000. Under the reduced tariff this number increased to 382,000, in 1865. The returns of the first six months of 1866 show an increase quite in correspondence to the still greater reduction of the tariff during that time. The great success which has attended this first effort at cheap telegraphing is highly important and suggestive. The same benefits and economy which has attended a cheap postal system wherever introduced, will also be realized by a similar reduction in telegraph rates. The time will come when telegraphing must be reduced to a mere moiety of its present rates. The first experiments will doubtless be made by Government, on some of our principal mail routes.

**MR. PEABODY'S WEALTH.**—An Eastern paper says that Mr. Peabody made a will in 1856, in which his bequests amounted to about one hundred million dollars. He has been engaged in many highly lucrative enterprises since, which, with the natural increase of such a vast property, after deducting his more than princely donations, must have fully doubled his wealth.

## Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

O. W. N. SMITH, W. B. EWER, A. T. DEWEY.  
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance, \$5.00  
One copy, six months, in advance, 3.00  
For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 11th, 1867.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.  
Mr. Frank L. Palmer, is a duly authorized agent for the Mining and Scientific Press. March 23, 1867.  
Mr. S. G. Steele will act as agent for the Mining and Scientific Press from this date. April, 27, 1867.

## San Francisco:

Saturday Morning, May 11, 1867.

## Notices to Correspondents.

**HISTORICUS.**—There are two celebrated English philosophers of the name of Bacon; viz: Roger, better known as Friar Bacon, and Francis, afterwards Lord Bacon. The former is the one you allude to as being the chemist or alchemist. If popular tradition is at all correct, there are good grounds for believing that Roger Bacon discovered the properties of gunpowder early in the thirteenth century; and the tales related about the brazen head which he is said to have kept in his studio, point also to his possessing considerable knowledge of many of the properties pertaining to electricity. Seeing that he lived in a barbarous and superstitious age, it cannot be surprising that he withheld from the vulgar much with which he was acquainted. On returning to Oxford from Paris, in 1240, he became celebrated among the learned at the latter university. By his attempts to expose ignorance and overthrow erroneous scholastic dogmas and the immorality of the clergy, he aroused the enmity of the ignorant and immoral; he was accused of practicing witchcraft, for which the studies alluded to would afford, in that ignorant age, ample coloring. On this charge he was thrown into prison, and nearly starved, and, according to some historians, narrowly escaped being burned as a magician. The *Opus Majus* of Friar Bacon stands amidst those dark pages of history like a beacon upon a waste, being perspicuous and comprehensive, and full of anticipations of the advantages likely to be derived from that mode of investigation afterwards insisted on by his great successor, Chancellor Bacon, nearly four centuries subsequently. Mr. Hallam, in his *History of the Middle Ages*, admits this resemblance in the following passage: "Whether Lord Bacon ever read the *Opus Majus*, I know not; but it is singular that his (Lord Bacon's) favorite quaint expression, *prærogative scientiarum*, should be found in that work; and whoever reads the sixth part of the *Opus Majus* upon experimental science, must be struck by it as the prototype, in spirit, of the *Novum Organum*. The same sanguine and sometimes rash confidence in the effect of physical discoveries, the same fondness for experiment, the same preference of induction to abstract reading, pervade both works."

**T. C. H., Philadelphia.**—The Landgren Process, which you enquire about, we have not had the opportunity of inspecting since the article was written to which you allude. The works have been suspended for several months, on account of legal proceedings, but will soon be resumed again, after which we hope to have further information on the subject. Respecting quartz crushers, we do not feel at full liberty to pass any decided opinion as to their respective merits. We understand that the amount of work accomplished in a given time by machines of equal size is much the same, whether Blake's, or Brodie's, or some of the other machines of similar construction are employed. For further information, we must refer you to their respective advertisements and circulars. This answer has been omitted several weeks, owing to its having been mis-filed.

**COMMUNICATIONS RECEIVED.**—"Markleeville Correspondence," from Serrow, and "Mining Experiments at Wisconsin Hill," by John Scott.

**NEW CHLORINATION WORKS.**—Mr. Mosheimer has shown us the drawings of a new plan of chlorination works, which he has recently designed for Mr. H. McKeadney, to be put up on his mine at Havilah, Kern River. These will be the most extensive works of the kind ever put up on this coast, being of capacity to work six tons every twenty-four hours. The entire mass of ore as it comes from the mill after the ordinary amalgamation works, will be roasted and put through the chlorination process; although the percentage of sulphurets is very small—less than three per cent. The reason for this unusual mode of treatment, is the extreme fineness of the gold. This fineness, and the quantity contained in the sulphurets is such that, as we are informed, although not more than \$45 per ton can be obtained by the ordinary mill process, it has paid at the chlorination works of Mr. Mosheimer, in this city, as high as \$1,700 per ton—as it comes from the mine. Mr. McKeadney has about 100 tons of such ore now on the surface and waiting for treatment. He will put up one of Mr. Mosheimer's combined shelf and reverberatory furnaces. The machinery for these works went down on the last steamer. The sands as they come from the mill, will be collected in settling vats—not even the muddy water being allowed to run away until it has deposited the precious metal which is held in mechanical suspension.

These works will differ somewhat from those of the same character at Grass Valley and Nevada. All the vats and precipitating tanks will be so arranged as to require the least amount of labor in handling the ore, liquors, etc. The tanks and vats will be placed on pivots so that they may be emptied of their contents by merely tipping them with levers. The ore, after being properly prepared will be raised by machinery and sifted instead of shoveled into the tanks; by which mode of handling, the subsequent process of chlorination will be more readily effected. The gas generator is also quite different from the ordinary construction; the gas being applied to the ore under considerable pressure, which greatly facilitates its permeation through the mass. Another important feature consists in the fact that the ore is moistened with a liquid which has a strong affinity for the chlorine by which it is more readily brought into contact with the fine particles of gold which are so intimately mixed with the ore to be treated. We hope soon to hear favorable reports from these works.

**OIL FROM SHALE.**—We have seen some samples of oil derived from a bituminous shale approaching to true coal. The shale from which this oil was distilled is located in Corral Hollow, Alameda county, where retorts have been put up by Messrs. Sutton & Co. The shale, or coal, is raised from a shaft 120 feet deep, at which point it is about four feet thick. It is said to yield from forty to sixty gallons of oil to the ton. Some of this oil was submitted to Mr. J. H. White, on Commercial street, for an analysis. One hundred and twenty fluid ounces yielded as follows:

Oils.	Temperature.	Fluid ounces.	Beaume.
Burning Oil.....	60° Fah.	20	40°
Burning Oil.....	60° Fah.	24	35°
Light lubricating oil.....	60° Fah.	48	27°
Light lubricating oil.....	60° Fah.	16	24°
Water.....		2	
Coke.....		5	
Loss.....		3.5	

The above oil contains about one per cent. of paraffine—a substance which, according to Professor Silliman, is generally absent from the native petroleum of California. The above sample of 120 ounces of crude oil was treated, by slow distillation, under a pressure of 27° Beaume, at 57° Fah. We are not aware of any other attempt to produce oil from shale or coal in California.

**JAMES MACKEN**, coppersmith, No. 226 Fremont street, appears to be doing a large amount of trade in this branch of metal work. Believing in the motto, "*nihil sine labore*," he gives his personal attention to his business.

[Reported for the Mining and Scientific Press.]

## California Academy of Natural Sciences.

## REGULAR MEETING.

MONDAY EVENING, May 6, 1867.

The President in the Chair. About thirty members present.

Messrs. F. F. Thomas, Silas A. White, B. Smith, M. J. McDonald, Wm. Patten and Philip Prior were elected Resident Members, and Dr. C. L. Anderson, of Santa Cruz, Cal., Henry Walter Bates, Assistant Secretary Royal Geographical Society of London, Prof. J. H. Balfour, of Edinburgh University, Dr. John Alexander Smith, F.R.S., of Edinburgh, James Haswell, M.A., of the Geological Society of Edinburgh, Capt. J. B. Calbeck, F.R.G.S., of Singapore, and Sir Roderick I. Murchison, President of the Royal Geographical Society of London, were elected Corresponding Members.

The members who took part in the field excursion to the Twelve-Mile House, made their reports. Mr. Loring mentioned the species of birds seen and collected. Mr. Yale presented an interesting fragment of fossiliferous outcrop, containing many species of shells of the post-pliocene period and many now living. Prof. Whitney remarked upon the singularly isolated character of this outcrop, and alluded to the extensive denudation that had occurred in that portion of the State.

Dr. Behr presented a chrysalis of a peculiar moth from Mazatlan, the female of which does not undergo a metamorphosis or change from the grub state, while the male is the same as other moths.

The President announced the receipt of missing numbers of *Silliman's Journal*, of *Garnett's Gold and Silver Tables*, and of *Ward's Catalogue of Fossil Casts*.

Mr. Stearns submitted, on behalf of J. Rowell, a description of a new species of *Psidium*—a genus of fresh water bivalve—found at Angel Island on the occasion of the late excursion, to which is given the name of *P. Angelica*.

Mr. Stearns read a paper upon Parhelia, and a recent display of these phenomena witnessed by him in this city. Some remarks followed upon sun and moon halos, during which Dr. Gibbons combated the popular notion that halos about the moon were infallible signs of rain. His observations proved that in some seasons these signs invariably failed in California, and at the East no rule, he thought, could be established on the subject.

## DIAMONDS IN CALIFORNIA.

Mr. Goodyear read a paper from Prof. Silliman, noticing several localities in this State where diamonds are found. Several of the jewels were also exhibited.

Prof. Whitney remarked that there are from fifteen to twenty different localities in California at which diamonds have been found in the course of washings for gold. The largest diamond yet found in this State weighed seven and a quarter grains. In reply to a question if there was not some familiar test by which miners might prove them, he answered that the easiest way was to try their hardness on other gems; but miners have not always these convenient to do so. A knowledge of the crystalline form, twenty-four sided, and the faces curved, was the surest test. The curved faces are often supposed to be the result of attrition by the action of water. Such is not the case; the diamond is too hard to yield to such action. He said that the popular notion that a diamond could be hammered out on an anvil without breaking, was a mistake, resulting from confounding hardness and toughness. He remarked further that it would not pay in California to wash the gravel beds solely for diamonds. Diamond washings do not pay in any country except with slave or convict labor.

## THE AGE AND POSITION OF COAL FORMATIONS.

Prof. Whitney read a very interesting paper on the age of the coal formations and the geological position of coal. He also stated that modern geological explorations had materially modified the earlier opinion of geologists with regard to the occurrence of coal. It was formerly held that valuable beds of coal were confined to a particular position in the series of geological formations; but it is now ascertained that while the important coal fields of Eastern Europe and the Eastern United States are of Paleozoic age, those of China, India and Australia belong chiefly to the Mesozoic series, while there are important deposits even as recent as the Cainozoic or Tertiary. The coal of the Pacific coast of North America belongs chiefly to the upper Cretaceous—the subdivision next below the Tertiary. The Professor called attention to the fact that the Cretaceous series, in which the coal of this coast is found, when occurring in

other parts of the world, is found to be one of the most barren in combustible material. Contrary to common report, no important deposits of coal have yet been found in the "Russian Possessions" on this coast. The desirableness and importance of coal discoveries in the region between the Sierra Nevada and the Rocky Mountains, was referred to in connection with the successful operation of the Pacific Railroad. The wood along the route must soon disappear. The hope was expressed that the geological expedition along the line of this route, recently set on foot under the direction of Mr. King, might be the means of developing some valuable information in this particular. A very excellent specimen of coal was exhibited to the Academy, which was taken by some member of the railroad survey from a load of coal which was being hauled to Salt Lake City, last summer, from a coal mine near this route.

## THE "SEQUOIA" FOUND FOSSILIZED IN GREENLAND.

Prof. Whitney mentioned, as a most interesting fact, that among the fossil miocene plants found in coal beds in Greenland, where eternal ice reigns now, are the sequoias or big trees now found living only in California.

## EXPLORATION OF RUSSIAN AMERICA.

Dr. Cooper stated that Mr. Ridgeway, the zoologist appointed to accompany the Government exploration of Russian America, when on that coast, a few years since, had found birds nearly identical with living species in Asia—a fact of much interest, since none of the same species are found on the eastern coast of America. There is here another suggestion of the former intimate relations between Western America and Eastern Asia.

## AN IMPORTANT GEOLOGICAL PAPER.

Prof. Whitney submitted for publication a very valuable paper by Baron Richthofen, on the subject of geology, particularly with reference to the natural system of volcanic rocks. Its publication as the first volume of the Academy's Memoirs was proposed. It consists of 150 manuscript pages.

Prof. Whitney presented the tooth of a hyena found in Calaveras county, and the first fossil remains of that animal found in America.

**A SELF GENERATING GAS LAMP.**—This useful lamp is now manufactured by Mr. John J. Hucks, at his factory, at North Beach, in this city. The principle on which it works is similar to that on which the petroleum stove operates. A good idea of its construction may be obtained by examining the representation which is given of it in connection with the advertisement in another column. The petroleum, naphtha or benzine is placed in a reservoir, shown at the upper extremity; when filled, in order to light the lamp, turn the cock, seen about half way from the reservoir, to the point where the flame is represented. On doing so, a portion of the oil will find its way into the little cup under the blaze. Set fire to this, and its burning will soon create sufficient heat to convert the benzine in the generator directly over the cup into gas. This gas now passes upward into a properly constructed burner, where it will continue to burn wherever a gas jet will hold its flame. Some of these lamps are so constructed that nothing short of a most violent gale of wind will extinguish them until the supply is cut off. Such lamps are intended for out-door works, or in underground operations that are carried on in the midst of strong currents of air. These lamps are also especially valuable for use in saloons and other places where doors are constantly being opened and shut, admitting strong currents of air. The ordinary kerosene lamp cannot be successfully burned in such places, and much inconvenience is, in consequence, often encountered, where gas works are not established. These self-generating gas lamps afford the cheapest light attainable, and can be relied upon anywhere. They have been used for twenty years in England, and are now just being introduced into this State. Until quite recently they have been imported; but the demand is such that an establishment for their manufacture has now been started in this city, thus adding still another to our rapidly increasing branches of industry. These lamps may be seen and their operation fully explained by calling at No. 13 Kearny street.

## Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

### REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

### REFERENCES:

S. COSNER, Sheriff.  
W. WALTER, Treasurer.  
W. JENNINGS,  
G. H. ENALLIS, Supervisors.  
L. McLAINE.

Any good blacksmith can put this lock on safe doors, boxes or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be. [See page 30 in Pacific Coast Directory.] A dealer or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

### Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA.

San Francisco, May 24, 1866.  
Recently, two of Wm. C. Bussey's new Patent Combination Burglar Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to vaults and safes, to entire satisfaction to parties interested.

KITREGE & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts. San Francisco, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SMITH,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

The undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st—Because it is impossible for either burglar or expert to pick it.
- 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHIRMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify that I am now using Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTER.

Attested by J. C. SHIRMAN, County Clerk.

CALIFORNIA LOCK AWARD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Burglar and Powder Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates. [Mining and Scientific Press, Sept. 29, 1866.]

They are the only safe lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which it was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKT & C. FLEISHEL,

19v14my11&S.1am

No. 18 Post street.

## Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

Hooper's Patent, Aug. 15, 1865.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a **Premium Medal.**

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemipumping, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-pistons and valve seats in the chest.

The following sizes are constantly manufactured of this

### SUPERIOR DEEP-WELL PUMP.

- No. 1—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.
- No. 2—Cylinder, 3 inches; stroke, 7 inches; capacity 1,250 gallons per hour; weight, 80 pounds.
- No. 3—Cylinder, 4 inches; stroke, 8 and 8 inches; capacity, 2,500 gallons per hour; weight, 20 pounds; with iron frame and slide complete.
- No. 4—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight, 300 pounds.
- No. 5—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

Nos. 3, 4 and 5 are made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

See illustration of the Valve of this Pump, and further description, in another part of this paper.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or 1am CUSHING & CO., Prop'rs, San Francisco.

**A METALLURGICAL MIRACLE.**—Bellani mentions the following very curious experiment: "If you melt an alloy of tin or lead in a crucible or ladle, and then allow it to get cold, and afterwards write with ordinary ink on the surface of the metal, which has been in contact with the sides of the vessel; you may again melt the alloy, and after it has cooled you can still read the letters on the surface! The melting may be repeated several times, and the letters will still be visible, even if the metal has been stirred while melted." Bellani's explanation of this curious phenomenon is, that a very thin layer of oxide is formed by the ink, which oxide is not reduced by the repeated burning of the metal.

**A NEW QUARTZ MILL.**—We would call attention to the advertisement of Mr. J. B. Hitchcock, in our issue of to-day. Mr. H. is agent for a new quartz mill. This mill is very complete, and the workmanship superior. The stamps are of about 800 pounds weight each; and the pans of the Hepburn & Peterson pattern. The price is reasonable. Call and see it.

**SPONGE PILLOWS AND BEDS.**—It is claimed that common sponge, finely cut up, is fully equal to feathers for pillows and beds, while it does not cost half so much. The cheapest sponge, well cleansed, is about as good as the dearest. Hence, large quantities might be turned to this useful purpose.

**STATE TEACHERS' INSTITUTE.**—This body is now in session in this city. It is fully attended. The exercises are of an extremely interesting character. Such re-unions and comparing of notes cannot but be of the greatest benefit to all who take part in them.

**FELTON & TAYLOR.**—Messrs. Franklin E. Felton and James M. Taylor have recently entered into copartnership for the practice of law, with a view to devote especial attention to proceedings under the patent law. Their office is at No. 536 Clay street.

NEBRASKA GEOLOGY.—A Washington telegram of May 7th, says that Dr. Hayden, of the University of Pennsylvania has been appointed to make a geological examination of Nebraska.

**Builders' Insurance Company.**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 16v14pqr

### QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

### First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or

J. B. HITCHCOCK,  
Millwright, Russ House.

### LINSEED OIL.

### The Pacific Linseed Oil & Lead Works

Are now prepared to furnish dealers and consumers

### Pure Linseed Oil,

Raw or Boiled, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Orders from the country will have prompt attention.

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v143m3p

### A. S. Hallidie & Co.,

MANUFACTURERS OF

### FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Wire Ropes, which have been in use for a number of years by the leading mines on the Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope, effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—  
**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—" " " " " "

**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope**—for Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**—½ to ¾ inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Cir. 100 ft.	Cir. 100 ft.	Cir. 100 ft.	Cir. 100 ft.	Brk'g Str. lbs.
2 55 15	33 5 100	1 3 3	1 3 3	2,300
2 83 2	55 6 130	1 3 3	1 3 3	3,700
3 170 2	91 8 236	1 3 3	1 3 3	6,300

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers.

The foundries and machine shops throughout the city are unusually busy at the present time. We have another article in continuation of our series on "Foundry and Machine Works," in type, which is crowded out to-day.

Jacob Snew, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the ART. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 16v14f

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-ly AUSTIN A. WELLS, Agent.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by D. H. WOODS, No. 23 Third street. 19v14ftr

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

### CUT NAILS.

2,000 KEGS ASSORTED SIZES.

For sale in any quantity, to close invoice, at the very

Lowest Rates, by

THOS. H. SELBY & CO.,

116 and 118 California Street,

SAN FRANCISCO.

19v14 3m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared, at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-Off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements. Every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

**SEDIMENT IN A HORSE'S STOMACH.**—We some time since gave a full account of the accumulation in the stomach of an ox, known as a "hair ball." Such aggregations are quite frequent in the bovine species, but are unknown in equine animals. A case, however, has recently been reported in Ireland, where a horse died of inflammation of the stomach, caused by the accumulation of a mass precisely like that of a hair ball, in form and aggregation, but composed of hairs from the husks of oats, cemented together into a round mass, with a glutinous accumulation of magnesia and lime. The hairs, for such accumulations in the stomach of an ox, are obtained from the animal licking itself; a horse never licks, consequently the hairs from his body can have no access to his stomach; but it may readily be conceived how the more indigestible portion of the covering of the oat kernel, above described, may commence an aggregation which would naturally end in the death of the animal.

**CHINESE FOR IDAHO.**—The Grass Valley Union, says that men from that place have contracted with a party of thirty-eight Chinamen to carry them to Idaho Territory, at the rate of \$38 per head. Each Chinaman is entitled to 150 pounds of freight.

The Marysville Appeal says the Chinese houses of that city are fitting out mining parties for Idaho.

From other sources we hear of numbers already on the road, making the journey by the various routes on foot.

**CHINESE TEA OF AMERICAN GROWTH.**—Plants of the Chinese tea shrub were recently in full bloom in North Carolina, and were fully five feet in height. Five pounds of "Bohea" made in 1865 from the leaves of these plants were considered equal to the best imported.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**TO PREVENT DRAFNESS.**—It is said that deafness among old people is too often the result of a lack of cleanliness. Those who are in the constant habit of carefully washing out their ears every day, very seldom become deaf from old age. Mr. T. M. Hopkins, an octogenarian, of Geneva, New York, reports to the American Institute that he has given this hint to several of his friends whose hearing was beginning to be impaired by old age, as they thought, but who, by compliance with this simple suggestion, have soon recovered it. Let those who are similarly afflicted, and who have neglected this trifling act of cleanliness, make the trial, and see if perchance they, also, may not be benefited by the hint.

**Important to Californians.**—Many inventors have  
lately had their claims for Patents seriously and in some  
cases fatally delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. The MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the regulations of the Department, and properly  
filed all necessary papers as Claim Agents.

THE CELEBRATED  
Self Generating Portable  
Gas Lamp.

This extraordinary Lamp pro-  
duces its own gas by the vapor-  
ization of Petroleum, Naphtha  
or kerosene. It emits neither  
smoke nor smell, and burns with  
a pure white flame, equal in in-  
tensity to an ordinary gas burn-  
er, and at an expense of from one  
to three cents per hour only, ac-  
cording to the quantity of light  
required. It is peculiarly adapted  
for mining purposes, also for  
stores, factories, billiard rooms,  
and in fact, for all purposes  
where regular and steady light is  
needed, and for which it is an ad-  
mirable substitute. As an out-  
door light it stands unrivaled,  
burning with undiminished bril-  
liancy in a strong wind.

Charge the reservoir with the prepared fluid, or with  
Benzine, from half to three-fourths full; allow a portion to  
run through into the cup, then turn off the tap and ignite  
the fluid, which will heat the burner sufficiently to gener-  
ate the gas, which will be seen issuing from the top. The  
lan must now be turned on, and a steady light will be main-  
tained till the whole of the contents of the reservoir is con-  
sumed.

A small needle, bent at the point and fixed in a holder,  
may be occasionally required to clear the minute hole  
through which the gas issues, and the regulating screw at  
the bottom turned a little back; but care must be taken not  
to force the screw too high, and it should never be used to  
extinguish the light—by turning the tap off, it will gradually  
go out.

When necessary to renew the cotton which is placed in  
the lower pipe to prevent the too rapid flow of the fluid, the  
lamp should be placed in a vise and the burner screwed off.  
The burnt cotton must then be withdrawn, and a fresh  
piece of stout cotton rag, one inch wide and four or five  
inches long, should be doubled over a piece of wire, and  
inserted into the pipe—the ends cut short off, the burner  
again screwed on with a little white lead, and the lamp is  
ready to use.

Manufactured solely by JOHN J. HUCKS, original prop-  
rietor, Factory, North Beach, San Francisco; and for sale  
by his agents in every city and town throughout the State.

**Lyon Mill and Mining Company, Kelsey Dis-**  
trict, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board  
of Trustees of said Company, held on the sixth day of  
May, 1867, an assessment of two (\$2) dollars per share was  
levied upon the capital stock of said Company, payable  
immediately, in United States gold coin, to the Secretary,  
J. M. Buffinton, 5 Government House, corner of Sansome  
and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the seventh day of June, 1867, will be sold as  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Saturday, the twenty-second day of June, 1867,  
to pay the delinquent assessment, together with costs of ad-  
vertising and expenses of sale. By order of the Board of  
Trustees.

J. M. BUFFINTON, Secretary.  
Office, No. 5 Government House, corner of Washington  
and Sansome streets. my11

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, No. 404 Montgomery street, San Francisco, California, on the twentieth day of May, 1867, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. P. SUTTON, Secretary.

Office, 440 California street, San Francisco. may4

OLNEY & CO., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

**Illegal Supplemental Advertising.**—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

**Lady Franklin Gold and Silver Mining Company.**

Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1867, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. R. LUTY, Secretary.

Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. my4

**North Star Gold and Silver Mining Company.**

Reese River Mining District, Lander County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fourteenth day of March, 1867, the several amounts set opposite the names of the respective shareholders as follows:

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference, as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,  
San Francisco.

## Steam Pumps,

## FOR SALE!

PATENT RIGHT OF HUNT'S WINDMILL for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes, Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

E. O. HUNT,  
29 SECOND STREET,  
San Francisco.

## DUDGEON'S

PATENT

## Hydraulic Lifting Jacks

AND

## BOILER PUNCHES,

15 1/4 Eighth street, cor. Minna. qr.

## REMINGTON'S ARMORY.

Agency, 310 Washington St., San Francisco.

## PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action; Repeaters, and vest-pocket Pistols, with copper ammunition. Police Revolvers, a new model, heavy size ball, 4 1/2 inch barrel, 1 1/2 Cal. — an entirely new arm—having a range and accuracy equal to a rifle, and a most perfect game. All the new models for sale very low.

ALBERT E. ORANE.

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machinery for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, it is a desideratum, and has been for these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, U, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county: "Rawhide Ranch, Tuolumne Co., Sept. 28, 1885. "JAMES BRODIE, San Francisco.—My dear Sir: I give me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill."

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL. This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel are hereby informed that on and after the 1st of November, 1886, the royalty charged for using the same will be valued to the sum of \$100 per Barrel.

The following explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1885.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR RY CRUSHING. This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1885.

BRODIE & RADCLIFF,  
Express Building, 402 Montgomery street,  
San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. C shows the valve in the closed position, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at D.

The advantages claimed for this Valve are: 1. Cheapness of construction. 2. Greater durability. 3. A tripping action from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, are for sale by

120 Front street, San Francisco.

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

See illustration and description of this pump, published every other week in this paper.

## Notice to Miners,

## Well-Borers and Water Companies.

M. FRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pines in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

5 1/2 St. Store, No. 125 Clay street, below Davis.

## BLAKE'S QUARTZ BREAKER!

KNAPP & GRANT, Agents for California.

25 1/2 St. 310 Washington street, San Francisco

## HUNTER'S

## Eureka Amalgamator!

FOR WORKING THE SANDS AS THEY PASS FROM the battery. The coarse particles of sand are reduced to pass through a No. 6 screen that would pass through a No. 5 in the battery; the fine flour gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The machine is four feet eight inches square on the bottom, and covered with iron dies 1/2 inches thick by four inches wide, extending across the bottom with alternate strips of wood on end of the same width. The rubbers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between the rubbers. The box is also lined with copper plates. The machine is set in operation by eccentrics, giving an oscillating motion, and the rubbers are suspended on iron hangers, and adjusted by set screws. One-fourth of a horse-power is sufficient to run one machine of ten tons capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from W. W. WATT, Esq., of the Eureka Mill, will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is from rock that pays \$80 per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I have ever used. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it; but the best recommendation I can give is that I will use it. Will you please go to the Vulcan Foundry and order them."

On the first of April I had an order for two more, for the Pittsburg Company at Nevada City.

The prices for all the machinery made, and dies and wood set in the bottom, and all the iron complete, is \$275. The weight is about one ton with cast iron box; but to save freight, the box can be made of boiler iron, saving 500 pounds weight.

Orders sent to the Vulcan Foundry, the Union Foundry, or the Fulton Foundry, First street, will be promptly attended to.

ANDREW HUNTER, Patentee.

P. S.—Patent allowed.

## HUNTER'S

## IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating all kinds of ores on shales, receiving a certain per cent. of the sulphurates as may be agreed upon, and will guarantee twenty per cent. more sulphurates than from any rock or concentrator built on the Pacific coast, saving at least thirty per cent. of the sulphurates contained in the ore. The sulphurates, if desired for shipping, will contain less than one per cent. of sand.

25 1/2 St. The above machine can be seen in operation at the Union Foundry, in this city, up stairs.

14 1/2 St.

## To Quartz Miners and Others!

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurates, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject examine it. Patent applied for.

14 1/2 St. JAMES HITCHENS.

## STRONG &amp; CO'S

## CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double miller and rollers, and is the best in the market.

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by

## For the Purchase and Shipping of Machinery

## OF ALL KINDS.

ESPECIAL ATTENTION GIVEN TO QUARTZ MILL Machinery and Findings, and Miners' Material of every description. I am prepared to execute orders, and give my personal attention to the execution of orders. I can guarantee the BEST class of work at the LOWEST PRICE in the city. Office, No. 120 Front street, San Francisco.

8 1/2 St.

By Express.—Two cents per copy will be added to our usual rates of subscription to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

[Written for the Mining and Scientific Press.]

## Southeastern Nevada.

BY J. D. EMERSON.

REVELLE DIST., Nye Co., April 12.

EDITORS PRESS:—The prospects of this district never were half so encouraging as at the present time. The Fisherman ledge had a slight break in it a week or two ago, and then the croakers and weak-elbowed fraternity infesting every mining camp gave utterance to their prophetic conceptions. They knew long ago that the ledge was of no account—that it would be dug out by the roots, and that the district did not contain a single mine of value. But the horse is now of another color—the far-seeing gentlemen tell us they knew from the first that the mines were of great value, and all that was required to convince every one of the fact, so long ago evident to them, was well-applied labor. When will men professing to have common sense see the absurdity of pretending to know more about undeveloped mines than the common miners themselves? If they will only let Nature be their teacher, they will be learning every day, and the longer they live, be the less disposed to boast of the trifling knowledge they possess.

The vein in the Fisherman is now from four to five feet wide, and the ore, with scarcely any assortment, will give a pulp assay of \$500 per ton. It pitches easterly, at an angle of about sixty degrees, and shows the most compact body of high-grade ore ever seen in any mine in the State. I have seen the Comstock, the Murphy, the Twin Ophirs, the Buckeye and the Silver Bend mines, but the Fisherman to-day is of far greater promise, as a mine of inestimable value, than any one of those when it was in the same stage of development. I mentioned, in a former notice of Reveille District, that the formation was granite and feldspathic porphyry, capped by an unstratified limestone of varying thickness. The developments recently made in quite a number of claims afford conclusive proof that the best lodes are on the western side of the belt, in or near a black calcareous slate, by which it is bounded on that side. Sometimes the ledges cut the slate at right angles, and rarely is a location found of any value, except for the small amount of rich surface ore it yields, if it runs in the same direction as the slate. Whenever a vein in this formation, having a rich mineral on the surface, has been worked upon, it has been found to go down and keep its width and high grade of ore. The ledges, on the other hand, which are found in the deep limestone, are imperfectly defined, and almost invariably pinch out; or if they still show quartz, it is, in a great measure, barren. Until the true bed-rock underlying the limestone is penetrated, such claims are not likely to be found reliable, and to open them to this depth will cost a considerable amount of money. There can now be no doubt whatever of the extraordinary value of about a dozen mines in the district, from any one of which quantities of ore can be extracted which will yield from \$300 to \$700 per ton. A large amount of work will be done during the next six months, and before another year goes round there will be more first-class silver mines in the district, partially opened, than are to be found in any other section of the State. We need more good miners, and as the wages are \$3 to \$4 per day in coin, with board, we are living in the hope that when the roads over the mountains are good, we shall induce mining skill and muscle to come from California to our assistance. Reveille is distant from Austin only about 130 miles, over a good road. The climate is excellent, and the country is not by any means fully prospected; so that, in his leisure time, every miner has a chance of finding a good mine for himself and his friends. As yet there is but a five-stamp mill in the District, and that is not capable of doing good work. There is a probability, however, of a well appointed twenty-stamp mill being built during the summer and early fall.

EXPANSION AND CONTRACTION.—During the recent hot weather, the draw on Long Bridge was found, in the middle of the day, so tightly closed as to be immovable; but at evening loose again. The longitudinal expansion of the iron rails was sufficient to cause this, and their ends were accordingly cut off.

"MISFORTUNES NEVER COME SINGLY."—An English magazine says that mining accidents have, from the earliest recorded instances, occurred in twos, and gives the following instances as proof: "In March, 1776, 10 men were killed at the Walker colliery in the north, and a week afterward 39 were destroyed at Fatfield. On December 6th, 1773, several persons were killed at a colliery near the Wear, and two days afterwards 28 lost their lives at Chater's Haugh in the same district. In June, 1794, 30 victims were the result of an explosion at Rickelton pit, near Picktree; and within two days 28 more were killed at Harratou. In October, 1799, 39 men were killed at Lumley, and the bodies of the poor fellows were never recovered. In October, 1805, 35 men were killed at Hebburn, and in November, 38 at Oxclose. On September 28th, 1813, there was an explosion at Hall pit, Fatfield, by which 32 persons were killed; and in December of the same year 22 lost their lives at Felling from a similar accident. On the 24th June, 1815, Success pit, Newbottle, exploded and 57 people were killed; and on the 27th, Sheriff Hill pit exploded, causing the destruction of 11. On October 19th, 1821, another pit at Newbottle exploded, and two persons were killed by the explosion; and on the 23d, 52 were killed by a similar misfortune at Wallsend.

Insects damage crops every year to the extent of \$300,000,000; enough to give every man a farm.

One of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), for Sacramento and Stockton, connecting with light-draft steamers for Marysville, Colusa, Chico, and Red Bluff.  
Office of the Company, northeast corner of Front and Jackson streets.

JOHN BENCHLEY,  
President.

### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

Fig. 1.

Fig. 2.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

Stair Work of all Kinds,

### PACIFIC BILLIARD TOURNAMENT.

Open to all Players on the Pacific Coast.

A GRAND BILLIARD TOURNAMENT FOR THE CHAMPIONSHIP of the Pacific Coast will take place at

Congress Hall, San Francisco, On the 16th, 17th and 18th days of May next.

First Prize—A splendid GOLD MOUNTED CUE and the CHAMPIONSHIP.  
There will also be four other prizes in cash, ranging from one hundred dollars up.

The New York American Billiard Players' Association's rules will be strictly adhered to in this contest.

A Committee of Billiard Players will be appointed to regulate the details of the Tournament.

Gentlemen wishing to participate in the contest will please communicate with

STRAHLE & HUGHES, 567 Market street, San Francisco. 16-14-1m

### Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 234 Sacramento street, opposite What Cheer House, San Francisco. 10v14-ly

### Just Published.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS of the Nervous System and Reproductive Organs, to be had by addressing and enclosing twenty-five cents, postage stamps to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v13-ly

### HEALTH! HEALTH!

No more Typhoid, or other Deadly Fevers

Contracted by inhaling the Noxious Gases of Sewers and Cesspools.

To prevent this, purchase one of Taylor's Stench Traps and Garbage Baskets.

And promote the health, comfort and cleanliness of your family. [For description see Mining and Scientific Press, April 6, 1897.] Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v14H

### SAN FRANCISCO BRUSH FACTORY, BRUSHES.

No. 211 California st., manufactures to order all kinds of brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root fibers; also, Sluice Brushes from the same material. The Patent Rattan, Street, Stable, Flue and Plume Brush, for which they have the exclusive right for the Pacific Coast.

All orders from the interior promptly executed. FELDMAN, SIMPSON & CO., Proprietors. 10v14qr

### ROWLAND, WALKER & CO.,

GROCERS,

Nos. 516 and 518 Washington street,

Are offering a complete assortment of GROCERIES at the LOWEST RATES. Quality guaranteed.

Goods delivered at any point within the city limits. 22v13-ly

### Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be put up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises) in fact, the portable principle is the power's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without cranes.

Also, Portable Saw and Grist Mills.

For sale by TREADWELL & CO., 9v14 6m15p Corner of Front and Market streets.

**MURDER IN ARIZONA.**—A most unprovoked murder was committed on the night of April 20th, at Callville. The victim was Mr. Jefferson Hartman, who has been for some time acting as deputy postmaster of El Dorado Cañon, in place of Mr. Frank S. Alling, who has been for several months in this city. Mr. Hartman had been to the Muddy Settlements, seventy miles north of El Dorado Cañon, and returning stopped at Callville to spend the night. In the morning he was found dead, his body pierced by nine buckshot. He was no doubt murdered either by the friends of a desperado, in whose capture he had aided a few days previously; or by a soldier, whom he had suspected of robbing him a short time previously of \$150. The soldier has not been seen since the murder, a circumstance tending to fix the crime more particularly on him. Mr. Hartman was a gentleman in excellent repute, who had won the esteem of all good men, and particularly of the officers at Fort El Dorado, with whom he associated. He was aged about 29 years, and was a New Yorker by birth. His murder has created a void in El Dorado Cañon which cannot easily be filled.

**MECHANICS' INSTITUTE—PREMIUM.**—At the last meeting of this Association, Mr. Edward Nunan introduced a resolution offering a premium of one thousand dollars for the best treatise on the "Resources of California, and the best mode of developing them." The resolution was unanimously adopted. By its terms, the Institute makes an appropriation of \$500; the other \$500 to be derived from the sale of the book, the copyright of which is to be the property of the Association. It is also proposed, although not yet determined upon, to offer a further premium of \$300 for the second best treatise. The work is to be ready for distribution at the next Industrial Exhibition in 1868; and it is suggested that a synopsis of it would appropriately serve as a portion of the address on the occasion of the opening of that Exhibition. A committee, to be appointed by the Board of Directors, will decide upon the merits of the competing essays. It is believed that if the idea is properly carried out, a valuable work will be the result.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

### FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

#### Directions for Operating Hendy's Concentrators:

- First—The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—Set the Pan, A, level, by its inner rim.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

#### References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL.....	Grass Valley, Nevada County.
GOLD HILL MILL.....	Grass Valley, Nevada County.
CONEY & BIGELOW MILL.....	Jackson, Amador County.
SPRING HILL MILL.....	Amador, Amador County.
GOLDEN GATE MILL.....	Valeano, Amador County.
OPHIR MILL.....	Placer County.
C. H. SCHNABER'S MILL.....	Doty Flat, Placer County.
GOLDEN RULE MILL.....	Stewart Flat, Placer County.
BENTON MILL.....	Bear Valley, Mariposa County.
LOUISIANA MILL.....	Coulterville, Mariposa County.
RAWHIDE RANCH MILL.....	Jamestown, Tuolumne County.
PEOPLE'S MILL.....	Alleghany, Sierra County.
TYRON & CO'S MILL.....	Prescott, Arizona.
WOOLSEY & CO'S MILL.....	Prescott, Arizona.
NOYES & CO'S MILL.....	Prescott, Arizona.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
TRIUNFO G. & S. M. CO.....	Lower California.

And in use in many other parts of this coast.

For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

#### Remarks:

Many Concentrators have been gotten up in this city. Some of these claim foreign origin; others are of home production. The sonorous Greek names, with which some of these have been dignified, ought, it would seem, to have entitled them to a better fate than that which has befallen them. A large proportion of these machines are now "numbered among the things that were." A few were still-born; never having had an existence except in the shape of advertisements and cuts, prematurely prepared by their too confident projectors. For one of these it was claimed, with a grand flourish of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order or in the way." Unfortunately, however, although it had a reasonable supply of legs, it obstinately refused to run. Amputation failed to remedy the defect, and it now lies forgotten among a heap of old iron,—a mechanical abortion.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works, for 1866, pages 51, 53.

#### CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,  
Union or Fulton Foundry, San Francisco.  
March, 1867.

**W. T. GARRATT,**  
City  
**BRASS AND BELL FOUNDER**  
Cor. Mission and Fremont sts.  
SAN FRANCISCO.  
Manufacturer of Brass, Zinc, and Anti-Friction or, Babbet Metal Castings;  
CHURCH AND STEAMBOAT BELLS.  
TAVERN AND HAND BELLS AND GONGS,  
FIRE ENGINES, FORCE AND LIFT PUMPS,  
Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZELS  
For Mining purposes, Iron Steam Pipe furnished with fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."  
Highest Market price paid for OLD BELLS, COPPER AND BRASS.

### Foundry for Sale.

A One-half Interest in the  
**UNION IRON WORKS,**  
SACRAMENTO,  
Owned by William R. Williams, is offered for sale on the most favorable terms.

#### A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
Sacramento, Cal.

### Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M., of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.  
On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:  
May 18th—MONTANA.....Capt. Jos. Sutton,  
Connecting with ARIZONA, Capt. Harris.

May 30th—SACRAMENTO.....Capt. J. M. Caverly,  
Connecting with OCEAN QUEEN, Capt. Muury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines can be obtained at the office of the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

### MAURICE DORE & CO.,

Real Estate, Stock and General Auctioneers,  
Office and Salesroom, 327 Montgomery st.  
H. A. COBB, Auctioneer.

#### Guardian's Sale of Real Estate.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE of the order of the Probate Court of the City and County of San Francisco, in the State of California, made on the 25th day of January, A. D. 1867, in the matter of the guardianship of the person and estate of Bertha Louisa Washburn, a minor, the undersigned, Guardian of the person and estate of said minor, will sell at public auction, to the highest bidder, for cash, in separate parcels and subject to confirmation by said Probate Court, on SATURDAY, the 25th day of May, A. D. 1867, at 12 o'clock M., at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, in said City and County, all the right, title, interest and estate of said minor in and to each of those lots, pieces or parcels of land situate, lying and being in the said city and county, and described as follows, viz:

PARCEL No. 1.—Lot on the west side of Stockton street, commencing 96 3/4 feet north of Jackson street; thence north 20 feet 7 1/2 inches, by a depth of 93 1/2 feet.

PARCEL No. 2.—Lot on the east side of Stockton street, commencing 87 1/2 feet north from N. E. corner of Stockton and Greenwich streets; thence north 50 feet, by a depth of 137 1/2 feet.

PARCEL No. 3.—Lot on S. W. corner of Sacramento and Gustavus streets, 60 feet front on Sacramento street by 77 1/2 feet deep on Gustavus street.

Terms and conditions of sale—Cash, to be paid on the day of sale.

Guardian of the person and estate of said minor,  
San Francisco, May 4th, 1867.

E. H. WASHBURN

Mining Shareholders' Directory.  
Mining Stock Sales of the Week.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ore, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

P. S. Jastram furnishes us with several specimens of ore from the Hamp. Williams mine at Kelso, fifteen miles east of Havilah. Several prospecting shafts have been sunk on this mine from fifty to eighty feet in depth. A tunnel is now being run to strike the vein at a depth of 120 feet. A twelve-stamp mill has just been received on the ground, and will be put up immediately. The gold from this mine assays \$11 per ounce. We have numbered these specimens as follows:

153 and 154 are said to be fair samples of the ore, which is of a very peculiar character, resembling a friable granite in a state of disintegration, rather than a quartz vein. Massive pieces of quartz, however, are sometimes found, and often rich in gold. Number

155 is probably a small specimen of that character, which has been broken out from this or some other vein, and became water-worn. It shows considerable free gold scattered over its surface. Such specimens are frequently found in this vicinity.

## Hunter's Improved Concentrator and New Amalgamator.

### CONCENTRATOR.

The illustration annexed (Fig. 1) is a correct view of Hunter's Improved Concentrator. The tables at the back are suspended on iron hangers; the first or lower end rests on iron rollers. They weigh about thirty pounds each, and vibrate at the slightest touch. They originally weighed over 100 pounds. The lower end of the table strikes against a steel spring, thus producing a percussion that moves the sulphurets over the highest portion of the table, while the sand and water pass off in front. The feed trough rests on rockers on the frame, and is moved by a crank pin in the end of the driving shaft. The driving shaft is placed in front of the table, thus giving free access to the machine.

In operating the machine, the sand is run into grading boxes—by which it is separated into three different grades. Each grade is run upon a table adjusted to its particular grade. The machines, as now constructed,

HUNTER'S CONCENTRATOR.

Fig. 2—HUNTER'S AMALGAMATOR.

require but very little attention; two or three tables can be laid in one frame, and driven by one belt and shaft.

### AMALGAMATOR.

Figure 2 is a view of Hunter's amalgamator, which, as now constructed, is four feet eight inches square. The pan, J, is made of cast or boiler iron, seven inches

deep, the sides lined with wood, K, one foot deep, with inside lining of copper plates. The bottom is covered with iron dies, e, e, e, four inches wide, with strips of wood, a, a, a, alternating with the iron dies. The rubbers, D, D, D, made of wood, four inches wide and three and three-quarters thick, bolted to cross-piece, B; the upper part of the rubbers

are rounded and covered with copper plates; the bottoms are shod with iron. The discharge end, F, is level with the top of the rubbers.

The machine is operated by means of a shaft and eccentrics, which makes sixty revolutions a minute, causing 120 backward and forward movements of the rubbers. The beneficial action of "rubbing," in the amalgamating process, is too well understood to need any further remark in this connection. The machine also works as a grinder, and is arranged with a steam chest for heating the pulp. It has also been used as a settler with the most satisfactory results. There are five of these machines now running at the Eureka mill, Grass Valley, where they are most highly approved of by Mr. Watt, the superintendent, and one of the most judicious and skillful millmen in California. Further information may be had of these machines by addressing A. Hunter, San Francisco, or by calling at the Fulton Foundry, No. 45 First street.

**PUSHING AHEAD.**—The work of the Central Pacific Railroad on the Truckee river is being pushed ahead rapidly. Fifteen miles of track will be laid from the State line toward Donner Lake in the course of two months. This will bring the rails within about ten miles of Donner Lake, and it is thought now that the gap between that point and Summit Valley will be filled by the first of November. They expect to complete the main tunnel at the Summit by the first of September next, one year from the commencement. The tunnel will be 1,700 feet long. The speed with which this tunnel is being pushed ahead is without parallel in the history of any similar work, at any place or any period.

**A CALIFORNIA INVENTION ABROAD.**—The circular movable saw-teeth, for circular saws, an ingenious device, invented by Mr. Warren P. Miller, of this city, and first illustrated in the MINING AND SCIENTIFIC PRESS, is meeting with extraordinary favor among millmen at the East. It has been recently illustrated in the *Scientific American*. A factory for their manufacture has been established in Philadelphia. The inventor is likely to realize a handsome fortune as the result of his ingenuity.

**WELL REPRESENTED.**—Colorado sends two hundred and sixty specimens to the Paris Exposition. This includes maps, photographs, etc., etc. Nearly two hundred and fifty lodes are represented.

The size of farms in California has decreased from an average of 4,066 acres to 300. This is one of the most hopeful signs of the times for the future growth and progress of this State.

**U. S. BONDS.**—We have received from Messrs. Belding, Keith & Co., London, a pamphlet giving a set of tables and convenient method of calculating exchange and converting United States Bonds into English currency, etc.

The Ensley Gas Company are erecting gas works at Vallejo. The site chosen is near the water, in front of the United States Hotel.

THE YOUNG MEN'S CHRISTIAN ASSOCIATION, of San José acknowledges receipt of the Press. Its members are earnest in their work.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 290.]

## MAMMOTH DISTRICT.

On the twenty-fourth day of December, 1863, Jas. Daley and R. V. Craig, then at Lone, met a Piute Indian, who, in consideration of a pony, promised to pilot them to richer and wonderful mines in the range of mountains opposite. They started in a due west direction, and on the following day (Christmas) camped at the spring in what is now the little town of Upper Weston. Here, indeed, they found, as their guide had promised, quartz in abundance. On exploring the hills below, they discovered a belt of coarse feldspathic granite, nearly a mile wide, in which occurs innumerable veins of quartz, all argentiferous, some of them of great power, and nearly all rich at the surface in chloride of silver. This seemed to be the land of promise for them, and the party immediately located the most prominent cropping lodes. A few days later, other parties had traced them here, and Mammoth District was organized, with R. V. Craig, Recorder, embracing ten miles square, extending five miles each way east, west, north and south from the spring at their camp in Craig's Cañon, to which was given the name of Willow Springs.

Early in February, Messrs. Hatch, Evans and party came in from the grand evacuation at Big creek, and pitched their tent a half mile below, where they laid out the present town of Ellsworth. Other prospectors soon found their way to Mammoth, and by June, 1864, the little town of Weston aspired to rivalry with its neighbor, Lone, across the valley. Things moved slowly, however, in Mammoth, until fall, when a large acquisition to the population settled along the broad cañon between the two towns, forming a straggling village a mile and a half long. It is a noticeable fact that not an individual of the settlers of that year has ever deserted the district. All remain and hold to their original locations, confident in the faith that they have ample wealth safely stored in the depths of their mines. The growth of this settlement has been slow, but steady and healthy. No excitement ever existed in relation to Mammoth; and so little is the district known abroad, that comparatively few have found their way here, while those who have, with a view of prospecting, have invariably remained.

I risk nothing in saying that within the boundaries of Mammoth there is more quartz and a larger number of lodes producing a greater variety of metals than in any ten miles square yet discovered in Nevada. It is ten miles from the east base of this range to the valley on the west, and parallel lodes occur at short intervals this entire distance. Over four hundred distinct lodes have been located, the major part of them remaining unopened, except by a little surface scratching; consequently their value is, in a great measure, undetermined. However, in the granite belt crossing the foothills on the east, a great number of these lodes have been explored to depths ranging from thirty to one hundred and forty feet, in almost every instance developing great increase in size and improvement in ore. Among the most extensive works now being prosecuted, we find the Mt. Vernon Co. foremost. Their mines are located in the hill south of the cañon and town, about midway of the granite belt. This company commenced work in April, 1866, and have driven a tunnel five hundred feet into the hill; also sunk a shaft one hundred and ten feet, which strikes the tunnel two hundred and eighty feet from its mouth. The shaft is eight by ten feet long in size, thoroughly timbered and

divided into two compartments. At the depth of one hundred feet it reached one of their lodes, which is twenty-one feet wide at that point, while at the surface its width does not exceed three feet. On the south side of the cañon, in the same belt, Messrs. Ferguson and Wilcox are sinking a large shaft on the American Flag lode. This has reached the depth of one hundred and forty-five feet, with similar increase in size and improvement in quality of ore.

Scores of lodes have been opened to the depth of eighty to one hundred and twenty feet, many of them showing remarkable improvement as they are explored. Prominent among these we find the Vigilante, Live Oak, Cactus, Rough Diamond, Hatch & Graham, Sacramento, Bowers, Northern Light, Uncle Sam, and Gould & Curry. The latter, belonging to the Ural G. & S. M. Co., of New York, is now being developed by a vertical shaft. It is probable that this company will erect a mill during the coming summer. The Hamilton G. & S. M. Co., of Philadelphia, also propose extensive operations on their numerous mines here this spring.

[To be Continued.]

[Written for the Mining and Scientific Press.]

## What is a Mining Engineer?

By J. S. PHILLIPS, C. E. M., Mining Engineer of Cornwall; Member S. E. M. S., London, etc.

EDITORS PRESS:—In the MINING and SCIENTIFIC PRESS, and other American journals, I have frequently seen most condemnatory remarks relating to inexperienced, interloping mining engineers, that have been sent to work mines in remote regions of this country, where the greater expenses of labor, manufactured materials and carriage, demand superior skill to ensure profitable development, even with rich lodes in favorable strata. To enumerate their legitimate callings, or illegitimate errors, would occupy more space and time than you will allow, or I can devote thereto. I however beg to forward the following, for those whom it may concern, answering the question—"What is a mining engineer?"

A man duly qualified by special education and practical experience to estimate the comparative values of mineral veins, and to conduct the numerous operations required for their profitable realization, should possess the following qualifications: Beyond the ordinary rudiments, his education should be theoretically advanced in algebraical, geometrical and trigonometrical mathematics; geology, chemistry, mineralogy, galvanism, magnetism, and mechanism; and, practically extended to analytical assaying, dressing, milling, smelting, and the general extraction of the useful minerals by the humid treatment.

In Civil Engineering, he should have sufficient operative knowledge to construct rail or common roads, canals, bridges, aqueducts, dams, or reservoirs; and be able to survey, with sufficient accuracy, the necessary subterranean passages for communication; by sinking, rising, or extending simultaneous shafts or tunnels, at the distances of from 100 to 3,000 feet, by the most irregular workings; and mapping the plans and sections thereof, with shafts, levels, winzes, stopes, and excavations; ramifications of dips, angles, spurs, variations and intersections of ledge or ledges therewith; so that he may be able to see before, breast their relative distances, bearings and positions; and thereby avoid groping his way in blind conjecture and expensive ignorance.

If practiced in Mechanical Engineering, he will possess a most powerful lever; for, being perfectly acquainted with pumping, hoisting, crushing, stamping, milling, digesting and smelting machinery, he will be enabled to design and forward his plans, by giving drawings for what he requires to be made, at the foundry or the mine; directing the various tradesmen, and supervising the erections at surface, and the extensive fixings beneath—for pumping, training, hoisting, ventilating, blasting, timbering, etc., etc., that require the greatest attention, and where preliminary errors cause recurring accident and continual waste, which sn-

tract from the larger profits that would otherwise accrue. In many far distant, mountainous, inaccessible, interior sections, where iron ore is also found, it is often advantageous to have, in addition to the usual carpenters', smiths', fitters', timbermen's, and pitman's workshops, a smelting and casting foundry, to manufacture, repair or renew the heavy wearing parts of the machinery, by which much expense of carriage, etc., is saved and transferred to profits. With these qualifications (which are theoretically synonymous with the Civil Engineer, and differing only in practice by their being directed and confined to mining requirements and a better knowledge of mineralogy), he must acquire sufficient further experience in the working of mines, as to the breaking of mineral and strata; to know if the cost for extraction will exceed the value obtained, be able to conduct the works in the most appropriate, expeditious and economical methods consistent with safety, and facilitate transit from the profitable portions of the ledge, by correctly positioned levels and shafts, through which the shortest possible horizontal, diagonal or vertical railways may convey the mineral to the surface, and thenceforward to dressing floors, crushing, milling, smelting or chemical works. A man of persevering acquisitiveness and industry, with sufficient firmness to combat the dangers and uncertainties of this profession, can become acquainted with these necessary qualifications in twenty years; and if he possesses sufficient integrity and honesty towards employers to condemn what he deems unprofitable, he is indeed worthy of his hire, and is a boon to the whole of the legitimate mining community.

The practice of mining companies have been most irrelevant; for they have shown no more discretion, as to who should have been sent to superintend their mines, than gratitude to those few qualified experts who have condemned their unworthy ledges, and sought the employment of others, in preference to wasting their funds. Such stockholders have generally worked their gains, more from the market than from the mines, and therefore neither desire, nor deserve, advice or sympathy; but, most unfortunately, it does not end with them, as their capital, properly expended, would have fostered and established mining as a staple industry, instead of degrading it as a rock to be avoided. And were it not that mining infatuates more than it deters, the consequences would have been that the enormous mineral resources of this coast now being wrought, would have remained concealed *in situ* for generations yet unborn.

Fortunately there are those who mine with rule and systematic caution, as they would manufacture or navigate; and there are beacons that warn and guide them from total loss to a secure and profitable haven, where insurance is guaranteed but by the steerage of the recognized and qualified pilot.

Humboldt City, Nev., April, 1867.

RANCHING AT LAST.—A Los Angeles letter to the San Bernardino *Guardian* of April 27th, has the following: "I understand that Mr. Stroug, who has been superintending a mine in San Francisco district, Arizona Territory, has obtained land of Don Pio Pico, at the Rancho, for the cultivation of the mulberry and the growing of silkworms." This we understand to be Charles L. Strong, who was at one time Superintendent of the Gould & Curry, in Virginia, Nevada, and was late Superintendent of the Moss ledge in Arizona.

A SMASH UP.—The engine at the Comet mill in Gold Hill, Nevada, was ready for a start the other day. The fly-wheel being on its center, it was lifted over by several men. It at once commenced revolving with constantly increasing rapidity. The throttle-valve refused to work. The engineer had barely escaped, when the wheel, which weighed 6,000 or 7,000 pounds, parted into its sections, one of which, weighing 350 pounds, went through the roof of the mill, and to a distance of 150 feet. The damage will be \$5,000. Nobody was hurt. The engine was an old one.

COCONUT CHARCOAL.—Charcoal from the shell of the coconut has been found to have a most extraordinary power for absorbing gases. It is very dense and brittle, and its fracture presents a sub-metallic luster.

[Written for the Mining and Scientific Press.]

## Mining in Boise Basin.

PIONEER CITY, April, 1867.

EDITORS PRESS:—Permit me, through your valuable paper, to give you a brief account of some of the mines in this section of country. We have had a very long winter, and a good deal of snow. The weather has been very mild, not hindering those at work drifting, more than four or five days this winter. The placer miners have had a long rest. If the miners in this camp would fix for drifting, as in Northern California, they could work to good advantage all the year round.

Some of our quartz miners have been getting out rock all winter. The Elk Horn G. & S. M. Co., is a corporation of 5,400 shares, or feet, located on three ledges, well defined. They have a 5-stamp mill capable of crushing ten tons of rock per day, which is run by water. They have a fine water privilege, abundance of water, enough to run five mills. The average yield of the rock per ton is about \$40; cost of getting out and crushing, per ton, less than \$15. In a new tunnel lately run by the company, they have struck the ledge four and a half feet wide, at a depth of over 300 feet. They can go 1,000 feet lower, if they choose. The company contemplate increasing their stamps the present season, having a large amount of rock on hand. This is a fine piece of property.

Next is the Big Muddy G. & S. M. Co., situated on Big Muddy, and owned by Messrs. Sifers & Wright. The situation of this ledge is in one of the best localities in this Basin, and the facilities for milling purposes are abundant. Plenty of the finest kinds of timber for fuel and mining purposes on the ground. Their tunnel is in over 100 feet, which shows a good ledge about four feet thick, with walls well defined. Hon. Geo. Hearst, of your city, visited this locality last summer, and thinks it is a very fine ledge indeed. The ore ore looks well, and assays well, as the following will show:

No. of Assay.	Gold.	Silver.	Total.
1st.—By Fred. Heller.....	\$14 64	\$450 59	\$465 05
2d.—S. Honigsberger.....	7 15	186 17	961 26
3d.—Baker & Day.....	215 84	297 07	512 91
4th.—Baker & Day.....	a trace	1,516 32	\$1 61
5th.....	a trace	50 64	
6th.....	a trace		
Gold and Silver.			
7th.—Bryant, agent of Pacific M. Co.....	\$384 63		
8th.....	240 62		
9th.....	121 54		
10th.....	31 20		
11th.....	84 82		
12th.—George Hearst.....	180 00		
13th.....	214 50		
14th.—Pacific Assay and Refining Works, S. F.....	301 00		

Average of 14 assays, per ton.....\$371 08  
This ledge can be traced for over two miles. On the south extension is W. H. Carter & Co., who are also doing good work on the ledge. The north extension is owned by Ben Willson & Co., who are thinking of putting up a mill before long, and they have the cash to do it.

Next is the Justicia G. & S. M. Co., situated six miles from Pioneer City, in a northeast direction, on what is known as Charlotte Creek. It is owned by Messrs. Popham & Duncan. They have struck the ledge in their tunnel at a distance of 210 feet, and at a depth of 500 from the surface. They have plenty of timber for all purposes, with a ditch which will carry 300 inches of water, with 200 feet fall. Sufficient ore will be taken out to pay all expenses, before smelting or crushing works are erected.

The False Bed-rock diggings, with a single exception, have done but little this winter. The owners were not prepared for drifting. The exception is on the Big Muddy, where they have been getting out dirt all winter. The gold is plainly to be seen in the dirt. The false bed-rock is composed of granite mixed with a soft cement. These false bed-rock diggings will be one of the resources of this country in a few years.

Spring will soon open. Ben. Willson, Esq., who has been rusticated all winter, and investing his surplus gold dust in your city, has returned, and is getting the water into his ditches. One ditch, only two miles long, carries 3,000 inches of water. The Clear Creek ditch carries 1,000 inches, and is owned by Willson & Garbison; the Mountain ditch carries 1,000 inches, also owned by Willson & Co. Other ditches furnish some water. Water is sold for sixty cents per twenty-four hours; but the miners have called a meeting, and propose to have it reduced to thirty cents—so we may have a water strike. How foolish for men without means to combine against capital. It is to be hoped that the matter will be compromised.  
JOHN HEMLEY.

## Mechanical.

## Cheapening the Cost of Iron.

The necessity for cheapening the cost of producing pig iron in this country is becoming more and more apparent to our iron producers, in consequence of the reduction of wages abroad and their increase at home. It is found impossible to secure a reasonable return for investments of this character with our present tariff, except by practicing the most rigid economy and the introduction of all the most approved appliances elsewhere known. In addition to the great disparity in wages, which has hitherto resulted so much to the advantage of English iron producers, our trans-Atlantic friends have also, of late, rather stole a march on us in the way of improvements in furnace construction—particularly with regard to size and height. The furnaces most recently constructed in England are nearly double the height of the highest in Pennsylvania. We recently made a lengthy notice of the great height to which they are now running up their furnaces in England—an elevation of 102 feet, with 27 feet boshes. Eighty-five feet is a common height there. It is found that there is a great economy in fuel from using these high furnaces—every particle of heat, except the small amount which radiates through the walls of the furnace, being utilized, while the gases also are all taken off and consumed for increasing the temperature of the hot-blast. A full description of these furnaces will be found on pages 147 and 163 of the present volume.

It is said that the saving of fuel between a furnace 40 feet high and one of 85 feet elevation, is fully twenty per cent.; while by using a blast at a temperature of 1,000°, instead of 700°, a saving of fifteen per cent. is effected; at least such is the statement of an English paper. The opinion was prevalent a few years ago, that the use of a hot-blast was an injury to the iron produced; but it is now found that the blast may be heated even to the temperature of the furnace itself without any injury to the iron. The blast may be readily heated, in practice, to 1,000° or 1,200°, by passing it through cast iron pipes, and that without any serious damage to the pipes themselves. These pipes are now usually heated in England almost entirely by the gases which are taken off at the top of the cupola, and brought down to the blast-heating stoves below in iron conduits, where it is burned, so as to keep up the necessary temperature of the iron tubes through which the draft passes on its way to the furnace. It is said that some of the English furnaces are now making iron with about one-half the fuel employed per ton in Pennsylvania, while the quality is improved by the very means used to economize the fuel. The higher the temperature of the hot-blast employed, so far, the better the iron is said to be, especially for forge purposes. Much attention is now being directed to this matter in this country. May it not be that our Oregon friends have made a mistake in the size of their furnace, which is thirty-two feet high, with nine feet boshes. It is to be hoped, however, that the excellent quality of their ore may make up for any deficiency in the character of their furnace. Of course such furnaces as we have been describing cost a large amount of money, and are calculated to turn out a proportionately increased quantity of iron. Perhaps it is wise to begin small; and we presume that when another furnace is to be erected, all the latest improvements abroad will be taken into most careful consideration.

EXTREMELY hard cast iron was made some years ago by M. Gaudin, by introducing a small quantity of borax, and more latterly by combining the fused iron with phosphate of iron and peroxide of manganese. This mixture cannot be forged, but is easily cast into any form desired, and may thus be brought into general use.

KRUPP'S STEEL WORKS, at Essen, in Prussia, cover 450 acres of land, fifty of which are under roof. It comprises 400 furnaces for melting, heating and puddling. The motive power is furnished by 160 steam engines. From 8,000 to 9,000 men are employed at the works in Essen, besides 2,000 at the mines which are owned by the company. These works are about four times the extent of all the foundries and machine shops in San Francisco put together. The largest crane has a lifting power of eighty tons. They have in course of erection the largest steam hammer in the world, which will weigh 125 tons, while the weight of the bed-plate will reach 600 tons. In laying the foundation for this immense hammer, the ground was excavated to the depth of ninety feet!

A NEW MECHANICAL APPLIANCE.—Large screw bolts, for securing armor plates to their places are forged in France, by a means or process known only to one establishment, where it is kept a profound secret. The Sheffield men have exercised their ingenuity not a little in attempting to accomplish the same thing; but hitherto without success. *Engineering* suggests that such screws (technically known as "wood screws") may be rolled between plates grooved in a proper manner. Others think the screw is forged in a machine, with a properly shaped trip hammer. One or the other process it is thought might be a practicable and valuable improvement, and one worthy the attention of ingenious mechanics.

PINS AND EYES.—The *London Engineering* in an article upon this subject, says that in all cases, but more particularly in bridge-work, it is important that the size of the pins and eyes should be so proportioned to the strain upon them that they will be of equal strength with the parts which they connect. In machinery, when the parts are subject to motion, sufficient bearing surface has to be provided to prevent heating, and it is generally this consideration which governs the size of the parts, those proportions which give the requisite bearing surface being generally amply sufficient as far as mere strength goes. After giving the results of experiments tried to determine the proper proportions of the eyes of the links and the connecting pins of the iron suspension bridge over the river Dnieper at Kieff, the chains of which weighed over 1,600 tons, and stating the proportions recommended by Sir Charles Fox and Professor Rankine, the *Engineering* expresses the opinion that when circumstances will allow its being done, the best way to obtain the requisite bearing surface for the pins of connecting links of small thickness in proportion to their section, is to increase the thickness of the eyes beyond that of the links themselves. This allows the metal around the eye to be made narrower, and it thus consequently diminishes the inequality of the strain throughout its section. Where the links are to be connected by a square section, or are of considerable thickness in proportion to their area, this thickening of the eye becomes unnecessary, as sufficient bearing surface is given without it. A rule for the size of eyes, which has been much used, and which gives generally good results, is to make the outside diameter of the eye equal to twice the diameter of the pin passed through it, and then to increase the thickness until the requisite sectional area is obtained.

THE SECTIONAL AREA.—Boulton and Watt's rule for finding the sectional area of a fly-wheel per horse power is: "Multiply 44,000 times the length of the stroke in feet by the square of the diameter of the cylinder in inches, and divide the product by the square of the number of revolutions per minute, multiplied by the cube of the diameter of the fly wheel in inches. The result and number will be the proper sectional area of the fly wheel in inches." See also Bourne's *Hand Book on the Steam Engine*, page 229.

GLUE FOR METALS.—A good glue for metals may be made by mixing with sixteen parts of melted glue one part gum ammoniac, and then adding one part of saltpetre acid.

The largest water wheel in this country is said to be running at Troy, N. Y. It is over sixty feet in diameter.

## Scientific Miscellany.

OREIDE—AN IMITATION OF GOLD.—This beautiful alloy, resembling gold in color, consists of pure copper, 100 parts; zinc or (preferably) tin, 17 parts; magnesia, six parts; sal ammonia, 3-6 parts; quicklime, 1-6 parts; tartar of commerce, nine parts. The copper is first melted, then the lime, magnesia, sal ammonia and tartar are added, little at a time, and the whole is briskly stirred for about half an hour so as to mix thoroughly; after which zinc is thrown on the surface in small grains, stirring until entirely fused. The crucible is now covered and the fusion kept up for about thirty-five minutes, when the dross is skimmed off and the alloy found ready for use. It is quite malleable and ductile, and may be drawn, stamped, chased, beaten into powder or into leaves, like gold leaf. In all of which conditions it is not distinguishable from gold, even by good judges, except by its inferior weight. There is an establishment at Waterbury, Conn., devoted exclusively to the manufacture of this alloy.

Another beautiful imitation of gold is made with ninety parts of copper and ten of aluminum, which must be perfectly pure, of the best quality, and in exact proportion. It is but little affected by the atmosphere, and is strong, malleable and homogeneous in structure.

PREPARING OXYGEN GAS—CAUTION.—Several accidents have occurred, and lives have been lost, while preparing oxygen gas from chloride of potash and oxide of manganese in retorts made for the purpose of such work. In order to prevent accident, Prof. Doremus, of New York, uses, instead of the ordinary copper retort, a common tea-kettle, into which he puts his materials, lutes down the lid with clay or plaster of paris, and attaches a tube to the spout of the tea-kettle. When placed over the fire, the kettle is tilted a little backwards, so that if the gas should be generated very rapidly, the worst that could happen would be the blowing off of the lid of the tea-kettle, instead of bursting it, to the danger of life and limb.

HYDROPHOBIA.—The reason of the inability of physicians to find any reliable antidote or cure for hydrophobia, is now attributed to the fact that it is a disease to which the susceptibility of individuals seems to vary so remarkably, that no remedy can be applicable to all. What will effect a cure in one case fails in another. It is said that Youatt, who made the diseases of animals his especial study, was bitten eight times by rabid animals, and saved himself from the usual effects by rubbing crystals of nitrate of silver into the wounds made. In other persons the remedy has failed.

HOTTINA is the name given to a "powder" recently devised by M. Hottin, of Paris, for rendering linen fire-proof. When used, it is mixed with an equal quantity of starch. It is prepared by adding a little ammonia to a solution of phosphoric acid and lime, and filtering with animal carbon. After filtering, concentrate to a certain point (not given) by evaporation, when five per cent. of gelatinous silicic acid is added, and the whole evaporated to dryness. A crystallized substance is the result, which may be pulverized and used, as above, in the form of a powder.

ANIMALCULES IN SNOW.—Late observations with the microscope show that numerous animalcules exist in snow, from which we learn that life is not restricted to within the range of temperature which has hitherto been assigned to it. The fluids which give life and the power of mobility to these minute organisms must be altogether unlike that of animals and insects—perhaps something akin to alcohol, but certainly possessing the power to resist a great extremity of cold.

THE astronomy of the southern heavens is about to be thoroughly studied and watched. Mr. Grubb, the celebrated optician of Dublin, has completed an enormous reflecting telescope, ordered by the Victoria Legislature, for the sum of \$25,000, for Melbourne. The tubes of the instrument are four feet and a half in diameter, the sides are made of tapering steel ribs, and the entire instrument is not only singular on account of its dimensions, but also because of its completeness, accuracy and finish.

THE POINT OF ABSOLUTE COLD, or the deprivation of all heat, which is the temperature of interplanetary space, is now estimated to be about 463° below zero, Fah. Persou, in calculating the heat absorbed by different bodies during fusion, used 256° F. as his "constant" or "absolute cold;" but Natterer having produced an artificial cold of 220° below zero, the "constant" is now estimated as above, at 463°.

SENSITIVE FLAME.—The jumping of a naked fish-tail flame, in response to musical sounds, was first accidentally observed by Prof. Lecompte, of South Carolina, at a musical party. At a lecture on the subject lately delivered at the Royal Institution of Great Britain, Prof. Tyndall exhibited some extraordinary experiments. He showed a flame twenty inches long, which was knocked down to eight by a very slight tap on a distant anvil. At a distance of twenty yards the dropping of a sixpence from the height of a couple of inches into his hand containing a few coins brought the flame down. It was sensibly increased by the creaking of boots in walking across the floor. On speaking to the flame it jumped at intervals, apparently picking certain sounds from the utterance, to which it could respond, while it was unaffected by others.

EXPANSION DUE TO THE GALVANIC CURRENT.—Mr. E. Edlund, of the Swedish Academy, has made a series of experiments with conductors of a galvanic current to ascertain whether the expansion they undergo is simply the result due their increased temperature or whether it is greater. He invariably found the expansion of his conductors (platinum, iron and brass) was greater than would be produced by the actual heating of these metals to the temperature indicated. This increased effect he proposes to call galvanic expansion, to distinguish it from caloric expansion. The galvanic expansion increased rapidly with the intensity of the current; but the ratio of expansion and intensity he has not yet determined.

M. DAUBREE has effected the decomposition of feldspar by rapid rotation in a cylindrical vessel with distilled water. The water became alkaline and he was enabled to separate considerable quantities of potash or soda, according to the rock operated on. If the process be practicable on an industrial scale, its importance is obvious. In a scientific point of view, the principle developed is very interesting, and may open the way for varied investigations. M. Daubree queries whether decomposition as well as mechanical disintegration of rock may not be produced by the motion of the sea.

A NEW SOURCE OF TANNIN.—Tanning with chestnut wood has been introduced to notice in Paris, by a tanner of Lyons, who claims that the tannin obtained from this source instead of the bark, makes leather of peculiar fineness, uniformity, and excellence of color, and superior in quality, in all respects, as compared with the best oak tanned.

A NEW ALKALOID, named Rhædine, has been discovered by Hesse in the red poppy and in opium. It is soluble in water, alcohol and ether, crystallizing from the last in white prisms. Ammonia precipitates it in white crystalline flocculi, bichloride of mercury gives a white amorphous precipitate, and strong acids decompose it in the gold, giving a purple solution.

SINGULAR FACT.—Gilded silk threads, when exposed to an intense electrical current, are acted upon in a singular manner. The gold which covers them is volatilized without the threads being injured by the heat.

BEEF PRESERVED FORTY YEARS.—Some beef deposited in tin cans beneath a heap of stones in Spitzbergen by Capt. Parry, in 1827, was recently discovered, and a portion was cooked and eaten at a supper given in Stockholm, Sweden.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

63,374.—MALT-DRYING APPARATUS.—H. A. Engels, C. H. Engels, and John Wieland, San Francisco, Cal.:

We claim, 1st, The mode of malt-drying in which the grains are mechanically carried into and spread about the kiln, then therein turned and propelled by rakes and at the same time submitted to a current of hot air combined with the heat of steam pipes, in a manner substantially as described above.

2d, The combination and arrangement of elevator, h, worm, p, picking-shaft, q, kilns, i, rakes, h, shafts, z, z, funnels, a and d, steam-pipes, k, k, hot-air pipes, l, n, n, o, o, flue, m, and chute, e, f, in the manner and for the purpose described.

63,490.—HOT-AIR FURNACE.—H. A. Engels, C. H. Engels, and John Wieland, San Francisco, Cal.:

We claim the arrangement of the set of pipes, c, i, p, l, q, bolted and cemented together, and at the same time staying the side plates, the sections, and the whole structure of the furnace by the means of the grooved shoulders and flanges of said pipes, as shown in Figs. 5 and 6, in combination with the square tubes or drying-chambers, r, s, substantially in the manner, for the purpose, and upon the principle as herein set forth.

63,534.—WEED-CUTTER.—C. G. Lathrop, San José, Cal.:

I claim, 1st, A weed-cutter, made and operating substantially as herein shown and described.

2d, The V-shaped cutter, I, provided with knives, H, at its ends, substantially as and for the purposes herein shown and described.

3d, The circular revolving colter, G, arranged in front of the plow-beam in combination with the cutters, I and K, all made and operating substantially as herein shown and described.

4th, The adjustable draught-attachment, E and F, in combination with the cutters, G, I, and K, as set forth.

5th, A weed-cutter so constructed that either the knives or the wheels on which the whole device is supported can be adjusted up and down, so that the cutters can be brought more or less to the ground.

This invention relates to an apparatus for reducing manual labor in eradicating weeds and also for completely destroying the latter. It consists chiefly in the use of a V-shaped horizontal cutter which is secured to a standard that is attached to the underside of a common plow beam.

63,585.—BOAT AND DAVIT TACKLE.—Edgar Wakeman, Brooklyn, Cal.:

I claim, 1st, Uniting the davit-tackle to the hoist by means of a hook-link, B, in combination with correspondingly shaped hook-strap or bracket, C, when said link and hook-strap are jammed and held together by means of a cam or lever, substantially as described.

2d, Uniting and detaching the hoat to and from the davit tackle by means of a lever or cam, in combination with the hook-link, B, and strap, C, substantially as described.

63,647.—IMPROVEMENT IN CULTIVATOR TEETH.—D. C. Matteson and Truman P. Williamson, Stockton, Cal.:

We claim, 1st, The adjustable bit, A, and the leveled foot of the curved standard, C, resting on the said bit, in combination with the double mold-board or shovel, B, the same fitting over the standard and bit, substantially as described.

2d, The oblong hlock or span, D, in combination with the manner of fastening the teeth together by bolts passing through the mold-board, bit and span, substantially as described.

The nature of the above invention consists in providing a "cultivator tooth," having a double pointed bit, so constructed that when the hovel wears from the bottom of the point it can be turned over, thus sharpening itself, it being attached to a standard, over which and the bit, is placed a double mold-board or shovel; the whole held together by bolts passing through them and the span, transversely at the bottom. The bit can also be turned around, and the other end used when the first is worn out. By this arrangement and construction of cultivator teeth, a mechanism is had that will be found admirably adapted for preparing the soil of

the Pacific coast for seeding after plowing, it being the usual custom to follow by cultivator after the land has remained unseeded for a season; or it may be used to prepare new ground in its hardest state. Several other important advantages are claimed for this invention, not enumerated above.

63,645.—QUARTZ MILL.—Thomas Varney, San Francisco, Cal.:

I claim the combination of the slots in the smooth grinding surface filled with wood with the peculiar form of the revolving grinder, m, and stationary grinder, p, when constructed and operating substantially as described and for the purpose as set forth.

63,684.—BIT BRACE.—William H. Woods, San Francisco, Cal.:

I claim the brace-head consisting of the collar, D, the hlock, E, the pin, g, and the steps, m and n, with the nut, G, substantially as and for the purpose described.

The nature of this invention is to provide an improved bit-brace, so constructed that the bit may be easily and securely fastened to the stock, and the wear between the stationary and movable parts may be compensated for, and so much lessened. To accomplish these ends, the brace has a slot cut in the side, at the lower extremity, within which moves a key, turning on a pivot at its upper end. A collar, the inside of which is eccentric, surrounds the shaft of the brace and key, and by simply turning it partly round, forces the key into the depression in the head of the bit. At the upper end of the brace is an opening, in which is placed a small steel pin, which also fits loosely in the head. Both ends of this pin turn on a steel die, and any wear is compensated by a check-nut, which can be moved at pleasure as necessity requires.

## RECENT INVENTIONS.

AN IMPROVED WAGON SPRING.—Mr. E. P. McCarthy, of this city, has devised an improved wagon spring, the design of which is to provide an elliptical spring so constructed that the spring will not be easily broken, however great the weight or the spring or tension which may be put upon them. In order to accomplish this object, Mr. McCarthy attaches to the inner surface of both the upper and lower portion of the spring, metal cups, so secured that when brought together they form a globe. Midway between these is fixed a rubber ball, by means of a spindle passing through it, so that when the spring is brought together sufficiently, the ball is held between the cups, and thus receives the weight of the load. By the use of this spring, a much greater load can be carried without danger of breaking the spring, although the said spring may be made much lighter than those of ordinary construction. The cups are made sufficiently shallow as not to allow of their edges coming together. In case a break should occur, the cups and ball furnish a safe and sure support for the wagon or buggy, thereby preventing any possibility of danger to life or limb from the breaking of a spring. These springs can be made much cheaper than those now in use, as but a single piece of iron is used for each upper and lower part of a spring. The additional lifts, which now add so greatly to the cost and weight of a spring are all dispensed with. This improved spring is therefore neater, cheaper and safer than any now in use. A patent has been applied for the same through this office. Patents will also be taken out in the principal European countries.

RUSSIAN AMERICAN TELEGRAPH.—A correspondence between the Western Union Telegraph Company and Secretary Seward, is published. The company state that work on the line has been discontinued, after an expenditure of \$3,000,000, the now assured success of the Atlantic cable rendering the enterprise one of doubtful pecuniary profit; and request the Secretary to use his influence with the Russian Minister at Washington, to the end that a mutual understanding with that government, and perhaps some arrangement, may be effected. Mr. Seward, in his reply, thanks the company for its frank and cordial communication, and promises to comply with its request.

JOINT STOCK COMPANY FOR INVENTORS.—Mr. J. H. Reynerson, of Decatur county, Iowa, proposes, through the American Institute, that inventors form a company, with shops at Washington, where they could have access to the Patent Office, and keep ingenious machines at work to improve other inventions. He thinks they would make money.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, May 18, 1867.

## CITY STOCKS.

Transactions in City Stocks in the Board continue light. We note sales of Spring Valley Water at \$67 3/4 share; San Francisco Gas at \$65.50, and Cal. Steam Nav. Co. at 70 3/4 cent. Twenty-eight shares of Union Ins. Co. realized \$107 3/4 share. The Bank of California paid its usual dividend of 1 3/4 cent. per month on the 15th inst. The Omnibus and North Beach and Mission Railroad Companies paid dividends of 1/2 3/4 cent. on the 15th inst.

## MINING SHARE MARKET.

The Mining Share Market has been somewhat irregular since our last reference. Some stocks experienced a material decline early in the week, while others have been well maintained at a slight advance. At the close, the market obtained more firmness under large sales of several prominent stocks. Out of \$1,255,400 in bullion obtained by eleven companies located on the Comstock lode during the month of April, \$460,200 was returned in the shape of dividends by nine of them. The Gould & Curry and the Confidence companies, whose receipts are included in the above amount, paid no dividends during the month.

HALE & NORCROSS—continues out of the market. During the past week it was quoted at \$2,810 bid and \$3,400 asked. We are informed that the present yield of ore is fully up to the average reported in our last issue—\$40 per ton. The new shaft is now about 330 feet in depth.

SAVAGE—has been dull of sale, but closing quotations of last week have been well maintained, opening at \$3,225@3,200, improving to \$3,250, and closing yesterday at \$3,250. During the week ending May 11th, 1,919 tons of ore were taken from the mine, showing an assay value of \$81,033, equal to \$42.22 per ton. Of this amount, 57 tons came from the old works, 57 from the sixth station, 1,499 from the seventh station—north and middle mine—and 306 tons from the south mine—seventh or second station. The ore is said to be decreasing in the sixth station, but in the seventh the breasts open out splendidly, and are reported to look better than the sixth station did at any time. The seventh station is now designated by north, middle and south mines. Most of the present yield comes from the north mine, where eight floors above the track have been opened, disclosing fine ore everywhere. In the middle mine, only two floors have been opened thus far, which are also reported to be in good ore. Work is somewhat retarded in the south mine, on account of the frequent caves, but the ore obtained shows an improvement in quality. The shaft has attained a depth of 80 feet below the third, or eighth, station. On the third station, good progress is being made in the north and southwest drifts, both of which are in about 165 feet.

CROWN POINT—has been quite active, declining from \$1,775 to \$1,575, rallying to \$1,650, then selling at \$1,450, ex-dividend, and closing at \$1,605. During the week ending May 10th, 621 tons of ore were extracted. The east vein on the 500-foot level has been opened 35 feet, showing no material change. Work has been resumed on the west drift, which is now in 109 feet, and it was expected that they would soon commence to sink toward the sixth level. This company is now erecting machinery that will enable them to sink to a depth of 1,600 feet, which, it is thought, will be completed in four months hence.

YELLOW JACKET—has been sold to a considerable extent under a rapid improvement, rising from \$1,530 to \$1,736, and closing at \$1,745. It is said that very encouraging reports have lately been received in this city as to the present quality of ore obtained from this mine, the average assays being much higher than formerly.

GOULD & CURRY—has been well main-

tained at an advance over the closing quotations of last week, selling at \$585@595, and closing yesterday at \$575. We have nothing of special interest relative to this mine. The mill started up again on the 11th inst.

CHOLLAR-POTOSI—continues to be the most active stock on the list, opening at \$500, seller 30, and \$520, receding to \$480, ex-dividend, advancing to \$557.50, and closing at \$593. We learn that the Blue Wing station continues to produce the usual quantity of ore. The body of ore in the Santa Fé station is said to be 216 feet long, and the whole extent of it has not yet been ascertained. The three winzes have attained the following depths: north, 40 feet; middle, 85 feet, and south, 63 feet—all reported to be in ore the entire distance. As soon as the drift from the lower Santa Fé connects with the north winze, the increased production of ore will be about 100 tons per day. The ore shipped to custom mills during the week ending May 11th amounted to 3,948 tons. The following is an estimate of ore in this mine, made by Mr. Stretch, the company's surveyor, and which he states to be considerably under the probable extent:

Above Blue Wing station or adit level.....	8,000 tons.
Between adit and Santa Fé station.....	32,697
Less waste.....	8,175
.....	24,524 tons.
Santa Fé station.....	38,720
Less waste.....	9,630
.....	29,090 tons.
Below lower Santa Fé.....	14,655
Less waste.....	3,666
.....	11,000 tons.
Other portions of mine.....	5,000 tons.
Total.....	77,564 tons.

ALPHA—receded from \$430 to \$405.... BELCHER declined from \$400 to \$355, advanced to \$397.50, and closed at \$391.... OPHIR improved from \$435 to \$445, seller 30, declined to \$350, then sold at \$390@350, and closed at \$400. The tenth station drift south has been turned westward and run beyond the point at which the west wall should be found (judging from the developments on the ninth level) without reaching the east clay. The tenth station drift north has also been turned westward through the east clay, with the intention of running it on the ledge.

IMPERIAL—opened at \$240, declined to \$200, rallied to \$230, then sold at \$211, ex-dividend, and closed at \$186. The first clean-up of the Rock Point mill for the current month yielded \$10,000 in bullion.

EMPIRE—receded from \$185 to \$160, then sold at \$170 and \$165, ex-dividend, and closed on Thursday at \$174. The bullion returns of this company in April amounted to \$22,884.66. A dividend of \$6 per share was paid on the 15th inst.

KENTUCK—sold at \$200 per share. We have been furnished with the following statement of the operations of this company during the month of April, 1867:

Gross yield.....	\$108,933 63
Grinding expense.....	\$3,292 89
Labor.....	7,315 50
Assaying and taxes.....	1,397 39
Lumber.....	2,673 72
Expense account.....	1,906 83
Wood.....	749 74
Sundry, etc.....	554 00
.....	2,179 16
.....	48,272 23

Net profits for April.....\$50,681 30  
After the payment of a dividend of \$20 per share (\$40,000) on the 15th inst., this company carries over a surplus of \$22,207.72. They reduced 2,183 tons of ore in April, showing a yield of \$49.91 per ton.

CONFIDENCE—advanced from \$65 to \$80, and closed yesterday at \$70.... GOLD HILL Q. M. Co. sold at \$170.... OVERMAN at \$41 @47, and closed at \$45. Sale of delinquent stock postponed to June 10th.... BULLION declined from \$45 to \$39, and sold yesterday at \$40.... DANBY advanced from \$12 to \$30, receded to \$21, and closed at \$23.50.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,411,678.

**Gold Bars**, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

## Perry Davis' Vegetable Pain Killer,

After a thorough trial, by innumerable living witnesses, has proved itself the Medicine of the Age. Although there have been many medicinal preparations brought before the public since the first introduction of Perry Davis' Vegetable Pain Killer, and large amounts expended in the introduction of the Pain Killer has continued to steadily advance in the estimation of the world as the best Family Medicine ever introduced. It is an internal and external remedy. One positive proof of its efficacy, is that the sales have constantly increased, and upon its own merits. The effect of the Pain Killer upon the patient, when taken internally in cases of Cold, Cough, Bowel Complaints, Cholera, Dysentery, and other affections of the system, has been truly wonderful, and has won for it a name among medical preparations that can never be forgotten. Its success in removing pain, as an external remedy, in cases of Burns, Bruises, Sore Throat, Cuts, Stings of Insects, and other causes of suffering, has secured for it such a host of testimony, as an almost infallible remedy, that it will be handed down to posterity as one of the greatest medical discoveries of the nineteenth century.

Sold by all Medicine Dealers everywhere. 18v14-1m

## MINING SHAREHOLDERS' DIRECTORY

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

STEAM PLOWING IN ENGLAND has arrived to great excellence, and is largely practised. There are now some 400 steam plows at work there, by which about 230,000 acres of land are cultivated. The steam plows eat only when it is at work, does its work better, turning up the ground deeper and more thoroughly, and turns off vastly more work in proportion to the food (fuel) which it eats, than horses or oxen can do. England is far ahead of the United States in steam plowing. The 400 plows there do the work of 2,500 horses. Coal is more readily obtained there than either oats or hay. The great Fowler steam plow has been in successful use in England for the last ten years, and is capable, in all kinds of weather, of going thoroughly over an acre of ground every hour of the day. The one at New Orleans, which was recently sent over to this country, was constructed at a cost of \$12,500, and was sent for the purpose of being tested on the immense plantations on the banks of the Mississippi. Nearly all the English steam plows are driven by small stationary engines, which are transported from field to field; the plows are fastened to an iron or steel wire rope, which is drawn from one side of the field to the other by means of a clipped drum connected with the engine.

THE CHIGNONS.—The outcry that has been raised against the "chignons," according to the Eastern papers, is spoiling the business in New York. The Broadway shops that deal in them are losing their customers, and in more than one case orders have been issued to stop their manufacture. The importation of the raw material also will probably exhibit a sudden falling off.

NEW INCORPORATION.—May 15th.—Market street Homestead Association. Capital stock, \$72,000; 160 shares of \$450 each. Trustees—Wm. C. Stevens, Robert Mayers, Henry C. Squire, H. A. Gorley, M. S. Osterhoudt, Warren Holt, S. Theodore, H. E. McBride and J. S. Luty.

## Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

## METALLURGICAL WORKS,

AND—

## Practical Mining School,

Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuric, pyrites, and the so-called "rebels" ores, are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL. J. R. MURPHY. 10v10

## MOSHEIMER'S

## Metallurgic Works

## And Practical School for Assaying and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLURGIC Works, and is prepared to reduce any kind of Ores, by Smelting, Amalgamating, or other processes, that the nature of the ore may require.

Practical instructions given in Assaying, all branches of Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating Ores, I can offer better concentrating machinery than any in use in California, and especially such as will save the fine or floating gold and sulphurets.

SAN FRANCISCO.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of May 4th: The following companies are at work in Silver Mountain Dist.: Illinois, California, Mountain, Washington, Lady Elgin, Pennsylvania, Balacava, and I. X. L. Several other companies will commence as soon as the "dead-heads" can be worked out through the operations of the "Partnership Mining Law." The present appearance of the Balacava Co. is very flattering to stockholders.

## Butte County.

From the Sutter *Banner* of May 11th: A piece of gold weighing fifty ounces was recently taken from the Willard claim.

## El Dorado County.

From the Placerville *Courier* of May 11th: A shaft has been driven down 298 ft. on the Pacific mine, and a clear white quartz, with a green stain, has been struck, which promises well.

Messrs. Dayton & Durning, of San Francisco, have contracted to run a tunnel, 1,200 ft. in length, on Fryer's claim, Negro Hill. They feel confident of having the work completed by the 1st of June next. When completed they will use 200 inches of water. The cost of the work is \$10,000.

The south extension of the Shepherd lead, in Poverty Point Dist., is turning out some very rich rock.

From the *Democrat* of May 11th: The Stillwagon mine is running regularly, and the quartz averages \$30 per ton. The Independence Co. have made one run, and their rock paid \$26 per ton—working second-class ore. The Olive Branch is producing some fine ore, and promises to be a rich ledge. The Missouri Co. have opened a fine vein, which prospects rich. The ledge averages two feet in width. The Texas—a ledge recently discovered by Mr. Magruder—at a depth of 35 ft. shows a vein one foot wide, of very rich ore.

## Los Angeles County.

The Los Angeles *News* says: Rich gold bearing quartz rock has recently been discovered near San Francisquito, a few miles from Los Angeles.

## Mariposa County.

From the Mariposa *Gazette* of May 11th: The mine or quartz vein located near Bull creek, and owned by Black and others, has been purchased by John Hite, of the Cave, and Mr. Kerrins, of this place, for \$3,660. The rock will average from \$15 to \$18 per ton.

Work has been commenced on the Princeton mine. The work now being done is preparatory to regular mining operations. Only ten men are employed at present. The mill will be running in three or four weeks.

## Nevada County.

From the *Transcript* of May 9th: Evans, Mull & Co., of Birchville Mining Dist., cleaned up, in their gravel claim, \$19,700. This is the claim that Stidger & Clark, for a fifth interest, paid \$10,000.

Work has been suspended on the Lucky mine, owing to a want of harmony in the management.

From a neighboring small mining camp, \$11,000 was shipped in a single week.

After a run of five weeks, the French Co., at North Bloomfield, took out \$7,100.

The English Co., at Badger Hill, Cherokee, at the last clean-up, averaged a profit of \$5 to the man.

The Russian mine, on Manzanita Hill, Bridgeport township, at the last clean-up, after a four weeks' run, got \$1,900, giving a dividend of \$360 to each of the owners after paying expenses.

Binsley & Bro. found in their sluice, at Kentucky Flat, a specimen worth \$60; also four other pieces, worth \$7, \$12, \$14 and \$15.

Thompson & Co., at Badger Hill, three miles below Newtown, struck their gravel lead very rich last week.

The Washoe Co., on Hill's Ravine, one mile west of Newtown, have also struck it very rich.

From same of 10th: There is considerable activity at Alpha, and a number of companies are at work. A German Co. near Omega commenced operations upon a claim that never paid anything before, and cleaned up, in one week, nearly 15 pounds of gold.

The miners at Whisky Flat are hard at work, averaging \$8 a day.

The companies on Rocky Bar are getting the water out of their mines, preparatory to starting in.

Poorman's Creek, for a distance of between four and five miles, is being worked with good results.

The new mill at the Pittsburg mine is in

operation. The company have out 200 tons of quartz, which they are now crushing.

The owners of the Jim ledge, on Gascon Ridge, started work last week.

The Daylight and Mary Jane ledges, of the Tecumseh mine, is yielding splendid looking rock.

Same of 11th: A specimen of sulphuret rock, weighing 100 pounds, taken from the Cornish mine, will pay \$25 per ton, and the sulphurets \$100 per ton.

Same of 12th: The Noramhagua mine, at Forest Springs, cleaned up \$5,000 from 70 loads of quartz, averaging \$64 per load.

Same of 15th: Several companies have commenced working the bed of Deer creek for a distance of two miles from the mouth of Wood's Ravine. Leath & Co. and Hawke & Co. are getting ready to work the bed of the creek at Stocking Flat. Richards & Co.'s Uriel lead, on Deer creek, have struck a rich seam, which is believed will pay from \$75 to \$100 per ton. The tunnel is in 1,430 feet.

From the *Gazette* of May 10th: The sulphuret works of Robert Cash, Grass Valley, have been destroyed by fire. The loss is between \$2,000 and \$3,000. He has contracted for rebuilding.

John R. Rush has leased the Lady Franklin mill, at Boston Ravine, to T. Cracklin and Joseph Southard for one year.

Same of 11th: The Green Emigrant claim, near Auburn, is paying astonishingly. A cigar box of gold was washed out of three pans of decomposed rock.

Same of 14th: Merrow, Cobb & Co., hydraulic miners at Scotch Flat, cleaned up last week, after ten days run, \$2,150, showing an improvement in the last run of \$350.

From the Grass Valley *National* of May 13th: During thirteen months ending January 1st, 1867, Hooper & Co., at the Gold Hill mill, in Grass Valley, crushed 105 lots of rock, 2,500 loads, which yielded \$70,000.

The Union Jack Co. turned out a lump of gold, the proceeds of three weeks crushing, valued at from \$6,000 to \$7,000. The rock was crushed at the Lone mill.

EXCELSIOR.—From the *Territorial Enterprise*, May 7th: The Montreal mine, Meadow Lake, have 200 tons of ore ready for crushing. Their mill will start about the 25th. The last crushing of 163 tons, yielded \$29.40. The U. S. Grant mine, Carlisle, after a week's run, cleaned up between \$1,500 and \$1,600. Assay of ore from the Mohawk and Montreal mine, gold, \$159.26; silver, \$2.83; total \$161.09. The California Co. have struck some very fine looking rock.

From the Meadow Lake *Sun*, May 11th: The Mohawk mill will be ready to start by the 1st of June. The Gold Run Co. have struck better ore than ever before. The Golden Eagle threw out at a single blast two tons of rock, in all of which coarse free gold was visible. The California Co. are now down about 100 ft.; the ledge is nine feet wide. The Trustees of the Excelsior Co. have decided to commence work immediately. Other companies are making preparations to begin work in a thorough manner.

## Placer County.

A nugget of solid gold, weighing 36 ozs., was taken out of the claim of two Germans, Joe and Chris, between the north and south forks of Weber creek.

From the *Stars and Stripes* of May 8th: The 10-stamp mill at the Rough & Ready claim, has been moved to Smith's Point and rebuilt. The Oro mill and mine are ready to go into operation.

W. H. Sears and others have purchased the Westchester claims; price, \$10,000.

Messrs. Cray & Coates intend building a mill about a quarter of a mile above the Westchester.

The Green Emigrant claim is massively rich. The ledge consists of a hard, white quartz, over three feet in thickness. Slabs and wedge-like pieces of quartz are found spangled and seamed with gold. The decomposed quartz found will average from \$150 to \$500 to the pan. Lowery & McCarty have commenced operations with their arastras, and expect to make the largest clean up ever heard of in California.

Colfax letter of May 10th to the Dntch Flat *Enquirer* says: The Rising Star Co. have resumed work. The rock taken out, it is believed, will pay \$56 to the ton. Eighty-five ft. of this claim was sold at Administrator's sale, and brought \$12.50 per foot. The claim of John Sutton & Co., from eight tons of rock, recently crushed, yielded \$16.50 per ton. Ditton & Co. are still at work on their claim. Walker & Co. have ceased operations, owing to misunderstandings.

There are 26 ditches in the county, supplying the mines with water, which originally cost \$1,628,000.

## Plumas County.

From the Quincy *National* of May 11th: The Mammoth ledge near Eureka mills, has lately prospected immensely rich; the pro-

prietors intend putting up a new mill. The water shaft in Sherman & Co's mill, at Argentine, was broken a few days ago, causing a short delay.

## Sacramento County.

From the Folsom *Telegraph* of May 11th: We learn that Milgate's new quartz mill, at Wall diggings, is running on rock from the Milgate claims, and is paying well.

## Shasta County.

From the Shasta *Courier* of May 11th: At a miners' meeting held at Ellsworth's mills, South Fork Dist., it was resolved that claim holders should define the limits of their ground within 60 days, and in case of failure, they are to be considered abandoned ones. Also, that sinking a shaft 25 feet on any claim should give the owner perpetual title.

The work on the South Fork mine is progressing. In addition to that already shipped, they have 11 tons ready for transportation. Crystal rock looks and prospects very rich. The Ohio, Pacific and Crystal extensions show fine rock, and bid fair to yield well. Work has been commenced on the Red Warrior. The stockholders are determined to keep the work going, so as to test the paying qualities of the mine.

Jollie & Dosh have commenced on rock taken from their claim at Muletown. They feel confident of doing well.

## Siskiyou County.

From the Yreka *Union* of May 4th: Mr. Sam Clary has been taking some handsome nuggets lately from his claim in Rock Gulch. The largest piece found weighed 12 ozs. There were several other chunks of several ounces each.

## Sierra County.

From the Downieville *Messenger* of May 11th: Mining prospects at Gibsonville and Newark are looking more favorable than for several years past. At Charcoal Ravine, several new claims are prospecting rich. A party from Downieville have jumped one of the old claims in this vicinity and are about going to work. Many new claims have been located between Gibsonville and La Porte. The sluice of Mr. Fisher, of Indian Valley, was robbed of \$500. Charlton & Co. was robbed of \$300; supposed to be by Chinamen.

A company of Frenchmen found a nugget weighing a little over 22 ozs. in their claim, just below the Cascades Sawmill, on the Middle Fork.

## Yuba County.

From the Sacramento *Bee* of May 14th: The Blue Gravel claim, at Smartsville, Yuba county, cleaned up \$75,000 after a run of 30 days. There is a material change for the better in the prospects of the Rattlesnake (Old Yuba) claim, Brown's Valley. One-fifth of the Union Co's claims, Long Bar, No. 2, Foster Bar township, has been sold at auction.

## ARIZONA.

From the *Miner*, April 20th: The average yield of gold from all parts of Arizona, in the aggregate, is from \$4,000 to \$5,000 per day. Major Coffin, of the Bully Bueno mine, is said to have met with good success in financial arrangements in Philadelphia. He is expected back in June.

The San Bernardino *Guardian* of May 11, says that there is but one mill now running in the Territory—the Wickenburg. It turns out about \$8,000 per week. After five days run \$7,500 was cleaned up.

## COLORADO.

The *Weekly Times* of April 23d, says that mining matters on James creek were looking extremely bright. Two arastras, one belonging to Wood & Mallory, and the other to Blivin & Brown, had been running two days, and were working finely. Dixon, Patten & Beebe's 12-stamp mill is being put up, and will be ready to commence work in 15 days. Mr. Gray has two small smelting furnaces completed, capable of manipulating 800 pounds of ore per day. From 400 pounds of ore from the Buckhorn lode, 5½ pounds of lead were obtained, which cupelled 4½ pounds of bullion. Scores of gold paying gulches will be thronged in Gilpin and Clear creek this summer.

This week, the Gunnell Co's mill yielded two or three ozs. of gold to the cord more than the previous week's run—145 ounces, worth \$3,000. A bed of fire clay has been discovered within four miles of Denver. It is 300 ft. long and 40 ft. in width.

The California Reduction Works have turned out, at the Excelsior mill, three bricks. One was from 1,000 lbs. of quartz from the Foot & Simmons' lode, worth \$56.63; another was from 1,500 lbs. of ore from the Pewabic, 251 ozs., worth \$38.37, and the third from the Crawford County lode, 2,000 lbs. ore, 4.27 ozs., \$65.40. The Gunnell Co. took out, during the week ending April 22d, 145 ozs. of gold; the Smith & Parmelee, 66 ozs., and the Chemung Co., 36 ozs.

The Quartz Hill tunnel is in 127 ft. The Black Hawk Co's mine never looked better than at present. The mine is turning out the best class of ore.

From 700 lbs. of silver ore from Georgetown, which was treated at the California Reduction Works, there were 40 lbs. of amalgam obtained, which will net about seven lbs. of pure silver.

Keith's mill is running on ore from the Foote & Simmons. Its yield for this week will amount to 150 ozs.

Among the latest mining news on the Upper Missouri is the discovery of very rich and extensive copper deposits in the valley of the Muscleshell, about sixty-five miles from Helena, Montana.

Fifty feet of the Amberg lode, Russell Dist., owned by Mr. Jones, has been sold for \$500. Mr. Robert Treats recently exhibited on the streets of Central three bars of gold, whose value was \$160.40—the product of 4,500 pounds of ore from three different lodes. Mr. J. W. Watson has organized a company in Philadelphia to work on the Baker lode, Argentine, and is now en route here with the necessary funds for a vigorous campaign this summer.

## IDAHO.

From the *World* of 27th: At a miners' meeting, held at Buena Vista Bar Dist., on Thursday, April 18th, it was resolved that all mining grounds, such as bar, gulch or hill claims, be laid over until the price of water is 30 cts. per in., and dump can be obtained, and notice of such claims be recorded on or before the first day of May of each year, and that all drifting claims be laid over from the first of March to the first of September. Also, that ground owned by persons who shall be absent from the district six months, shall be forfeited, unless the ground be left in charge of an authorized agent, and notice thereof placed on the Recorder's books.

Boise Basin can yield steady and good paying employment to hundreds of miners yet—there is no hazard here. The mines are extensive, and have proved rich and enduring.

The mining season has commenced sufficiently to enable us to judge of the work to be done this season. Down along the Bar over 200 men are at work, whose most sanguine expectations have fallen far short of the actual yield. A merchant who watched the washing of a single panful of winter drifting, assured us that there was not less than \$500 in the pan. Persons from the North Fork of Elk Creek assure us that the same condition of things prevailed at that place. The same report comes from Moores Creek. Observations on the Bonner Hill satisfied us that equally large products are realized there. Murphy and Highland cleaned up on Monday after a four days run, and got \$1,840. After an eight day's run, Mr. Donnelly on the old Canley claim made a clean up, and got about \$2,300. Water is furnished at 50 cts. per in. for 24 hours. On Moore's Creek, Elk Creek and all around Centerville, Boston, Placerville, Granite Creek, Pioneer, Muddy, North Fork of Elk, Gold Hill and Willow Creeks, the products of gold is above the average of the best mines of California. There are vast placers which have never been worked, which will yield from above the average to very large wages.

From the Owyhee *Avalanche* of May 4th: One of the Iowa companies under the superintendence of Mr. Jos. Gafford is running a tunnel to strike the ledge. Another under Uriah Perry is sinking a shaft just north of the discovery, as a prospect and preliminary to the permanent working of the ledge. Fred. Warnke & Co. have commenced sinking on the Leviathan.

The Rising Star mine is all it has been represented in size and richness. Ore is being taken out by Carter & Co.

W. B. Scott is prospecting for the south extension of the Sherman, and Don Vincent & Co. for the other—the latter's tunnel being in over 100 and the former 40 feet. Whisky ledge is yielding rock of a high grade of richness. There must be 10 tons of rock out that will yield an average of \$300 per ton. It contains much free gold and whole masses of it are sulphurets of gold and silver. The ledge is owned by Eastman, Edgerton, Townsend and others, who are working it. The vein is two feet thick near the surface.

## MONTANA.

From the *Post* of April 27th: The Gold Mountain lode situated in New York Dist., has a shaft on it to the depth of 70 ft., with a crevice 10½ ft. wide. The quartz will average about \$40 per ton. Dick Cook has a quartz mill which will be soon have on the Legal Tender lode, in Brown's Gulch, Madison county.

A small stampede started a few days since for Meadow Creek, on the Sterling road. From parties returned, we learn that on

North Meadow Creek, there are thousands of acres of bars in which color can be struck at any point. These bars are from 40 to 50 ft. high, and the stream furnishes sufficient water for hydraulic mining, with, it is believed, sufficient prospect of good wages.

At Highland on No. 3, in Coolie's dry gulch, Mr. Harrington a few days since, washed out in three hours, \$197 in coarse gold, and a nugget weighing \$50.40. Camp Creek and Seven-up Gulch are being prospected with good results.

Taylor, Thompson & Co. have purchased a one-fourth interest in the ground known as the Idaho Co.'s claims, Last Chance Gulch; the price paid was \$2,200.

Water was let into the Law Yaw ditch on last Saturday, and sluicing will commence in the lower portion of Last Chance Gulch immediately.

Col. Postlewhite yesterday deposited \$2,200 in bullion, for the last run of the Hawkeye mill. Work is suspended for a few days, on account of the difficulty in hauling ore through the snow, now rapidly melting.

Turnley's mill in Grizzly Gulch, cleaned up on last Tuesday \$4,000 from 70 tons of Whitlatch Union ore, which is within a fraction of \$60 to the ton.

The ore now being smelted by the Esler Mining Co.'s smelting works, is from the Legal Tender, which is at present the best paying ledge in the district. The Bannack Ditch and Mining Co. are cleaning out their aqueduct, for the accommodation of 3,000 in. of water; the ditch attains an altitude of 1,000 ft. at its head, and 400 ft. opposite Bannack.

From the Helena Gazette of April 20th: The water of the Silver Bow Ditch Co. will be furnished to holders of scrip as soon as the mining season opens. The waters are brought in from Divide Creek, a stream running nearly on top of the divide. This is one of the best districts in the Territory, with rich quartz and extensive placer diggings.

A new company, entitled the Wheeling and Montana Gold and Silver Mining and Transportation Co., has been organized in Wheeling, Va., for the prosecution of work upon leads in the Hot Springs Dist. The capital stock of the company is \$100,000. Their machinery is on the road and will be in operation before fall.

The shaft upon No. 3 east, Gregory lode, is now 140 ft. deep, and the crevice at that depth is 16 ft. wide, containing throughout the entire width, ore of exceeding richness. The Argentine, Axe and others are promising as well. The work of developing the Beavertown copper mines is still going on, with encouraging prospects. The Caskey lode is now producing better rock than ever; they have their tunnel in about 80 ft., with a 5-ft. crevice.

#### NEVADA.

##### Humboldt.

A considerable excitement has prevailed in Star City, during the past week, on account of the discovery of gold in considerable quantities in the bank of Star Creek, at the foot of Yankee Hill, back of the Telegraph Saloon.

##### Reese River.

From the *Reveille* of May 2d, we learn that Maj. Sherman shipped recently 17 bars of bullion—\$18,313.55—from 70 tons of ore from the Florida mine. Average yield of the ore, \$261.62 per ton. Aggregate product of bullion by the Florida mine, since it came under the control of Maj. Sherman, is about \$60,000.

The South America mine, southeast of the Manhattan Co.'s works, is to be worked for a Philadelphia Co. Thos. Triplett will place machinery on the mine immediately, and adopt the best methods for its thorough working.

Water has been reached in the mines of Silver Bend, and a more splendid quality of ore disclosed. Water has also been met in considerable volume in the incline that extends from the tunnel of the Combination Co. at 260 ft. from the surface. Mineral obtained from the ledges under the water is pronounced to be of superior quality. High-bridge ledge is 22 ft. thick where the water was tapped. Further work on the incline has been abandoned for the present, and the mine will be worked through a perpendicular shaft.

The Silver Chamber, in Union Hill, continues to be explored. At the greatest depth of the incline, the vein is four feet wide of solid quartz. The shaft on the Hattie mine is progressing well. It is intended to sink the shaft 50 ft. deeper, and then run levels for the vein.

The Manhattan mill, at Austin, Nevada, produced in 11 days, the value of \$25,000.

From *Reveille* of 3d: J. W. Varney, Supt. Empire mill, at Yankee Blade, has reduced lately several lots of very rich ore, among which are five tons of chloride ore from the Fuller mine, producing a net yield of \$3,-

219.80; the assay of the pulp exceeded \$800 per ton.

Nine tons of ore from the North River were worked, the pulp of which assayed—five tons of chloride ore, \$479.67; four tons of sulphurets, at the rate of \$224 per ton. The Buel North Star sent three tons to the mill, the pulp of which assayed at the rate of \$311.50 per ton. One ton of chloride ore from the Monroe mine, Yankee Blade, yielded by pulp assay \$256.07 silver per ton. Two tons of ore selected from a dump pile, that had been lying two years, yielded \$100 per ton.

The owners of the North River mine propose to sink a perpendicular shaft to cut the vein at 1,000 ft., on the line of its inclination. Work will be commenced soon.

From same of 4th: The ore from the Green Mountain is pronounced very rich, and if closely assayed, it is estimated will yield from \$800 to \$1,000 per ton. The Rutland mill, capable of reducing six tons daily, is in steady operation. Quality of the ore reduced is excellent, and yields from \$100 to \$300 per ton. Mr. Brobant thinks the ore at the mill will yield \$20,000. The ore reduced thus far was obtained from the Mohaska, Green Mountain and Cadet, of the Rutland Co.

There was exhibited recently at the assay office of J. S. Currie, a certificate of assay of ore from the Green Mountain ledge, which showed the fine yield of \$971 of silver per ton. Three thousand five hundred tons of ore from the celebrated Fisherman ledge of the Bullion Co., was yesterday taken to the Empire mill for reduction. It is said to be \$500 or \$600 ore.

From same of 6th: The American Flag, in Mammoth Dist. is the first prospected to the depth of 150 ft., yet a 12-ft. vein has been disclosed that will work \$300 per ton. The Mount Vernon Co. reopened on the main shaft with three shifts, on the first of April. Maj. C. S. Gillett, Supt. of the Ural Co., has commenced a main shaft, 7x9 ft. in the clear, and located so as to cut the Gould & Curry No. 1, at the depth of 100 ft., and the Ural at 300 ft.

Three tons of ore from the Buel North Star was worked at the Keystone mill, the pulp assay of which yielded at the rate of \$380.93 per ton; the three tons produced a bar of bullion worth \$1,028.70, an average yield of \$342.90 silver per ton. The Fisherman ledge of the Bullion Co., continues yielding ore of wonderful richness. The ledge exhibits a stratum of four feet of \$200 rock; 3,642 lbs. have been taken to the Empire mill, the pulp of which was assayed by Messrs. Boalt & Stetefeldt, giving \$512.65 silver per ton.

From same of 9th: Samples of ore from San Antonio Dist., were recently assayed and yielded as follows: No. 1, \$360.98; No. 2, \$361.71; No. 3, \$380.74; and No. 4, \$298.59.

George Sites arrived from San Antonio to-day with 6,000 ozs. of bullion from the Rigby mill, the product of ore obtained from the Liberty mine.

From same of 10th: Four tons from the Brown ledge, Bunker Hill Dist., yielded 500 ozs. of bullion, worked in an anarstra. Silver Chamber shows by assay of first class ore, \$933.09; of the second class, \$157.03.

From the Silver Bend Reporter of May 4th: The incline on the Liberty mine, San Antonio Dist., is down 275 ft. The ore is worked at the Rigby mill, and yields from \$250 to \$300 per ton. Work in the Morey Dist. is progressing. One claim has been sunk on 160 ft.; vein about four feet; yields \$300. Work on the Combination Co.'s mines suspended on account of water. Body of ore is 20 ft. thick and surprisingly rich. Work has been resumed on the Quintera mine. Harrison & Co. have sold the Achilles ground, near the Transylvania, for \$30,000. Preparations are making for work at Danville.

A small lot of ore from the Amazon lode, Reveille Dist., worked in one of the Austin mills, produced \$275 per ton.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise*, May 9th: The Cornet mill, Gold Hill, shattered by the bursting of a fly-wheel, will be removed to American City and rebuilt. Owing to the constant settling of the ground where it now stands the machinery cannot be kept level or in line. The foundation for the new hoisting works of the Empire and Imperial Cos., Gold Hill, is fast advancing to completion. The Crown Point Co. will build new hoisting works with modern improvements.

From the *Gold Hill News*, May 13th: Wells, Fargo & Co.'s Gold Hill office shipped five bars of bullion, weighing 328 lbs., valued at \$8,642.12. The following companies have

received bullion for melting and assay: Edwards & Weigand, 11,967 ozs.; Van Wyck & Co., 21,845 ozs.; and H. Harris, 1,170 ozs. Timbers for the mines continue to be scarce, and many of the mines are entirely out.

A quartz lode has been discovered in the hills  $1\frac{1}{2}$  miles from Carson. The lode is from 6 to 6 $\frac{1}{2}$  ft. wide, and is very rich with gold and silver. In an assay office at Virginia City is a brick valued at \$17,528.05. It is from the ore of the Imperial mine, and contains \$15,785.55 worth of silver, and \$1,742.51 of gold.

#### OREGON.

The Jacksonville *Sentinel* says that tunneling in Gold Hill is still progressing with good prospects of success. The ledge has been struck again, and the miners are running a shaft from the tunnel to the surface, a distance of 120 ft.

The *Sentinel* recently saw, at Mr. Beckman's banking house, a specimen of gold weighing \$510, which was obtained in the mines in that vicinity.

The *Oregonian* says that a very rich silver lead has been struck in the Cañonville mountains near Portland. A nugget of gold was taken out in the John Day mines, a short time ago, weighing \$404.

#### Smelt Your own Copper Ores.

It is one of the encouraging signs of the times to observe the growing disposition among the copper miners on this coast to smelt their ores, either at the mine or at some more convenient locality, and ship regulus instead of ore. There is no doubt but that, with all the drawbacks which appertain to California, with regard to high-priced labor, lack of good furnace material, high cost and inferior quality of fuel, etc., we shall yet be able to make the smelting of the sulphurets into regulus, and the carbonates and oxides into 90 or 95 per cent. copper, a profitable operation. With the projected increased facilities for transportation, and the influx of population, labor will gradually approach more nearly to the average of other countries; while closer observation will yet reveal to us better furnace material than any yet obtainable, and possibly a better quality of coal—all, or any of which advantages, will add gradually to the economy and profit of copper smelting, until we shall be able to produce that metal at a price and in quantities by which it can be successfully introduced into the great markets of Europe and Asia. The richness and extent of our mines, over those of any other country, will always be in our favor, and other things being equal, we must eventually control the copper market of the world.

It is well known that the yield of the copper mines of Great Britain has fallen off so rapidly of late that the smelting works of that country are in a large, if not the largest measure, dependent upon the product of the foreign mines. It has, moreover, been recently ascertained that at the present ruling prices of copper ores, the smelters are having it all their own way, and are getting rich at the expense of the mine-owners. So palpable has this fact become, that the mine-owners of England are calling upon the capitalists of that country to employ some of their surplus money in opening up new mines and extending the work of old ones, with the view of smelting their own ores—alleging that a mine that will smelt its own ores, can be made to pay a handsome profit, when the same mine would run in debt if it was compelled to sell its ores to the smelters.

Says a correspondent of the *London Mining Journal* of March 16th: "As a body the smelters of tin and copper have had it all their own way, and bought the produce of the mines on their own terms. \* \* \*

Whilst very few mines are paying, the smelters are said to be some of the richest men in the kingdom." These are significant words for California, and should urge to still further efforts, on our part, to "smelt our own ores," and not sell them to English speculators, who, by a huge combination, have succeeded in reducing the price of copper ores to the lowest figure at which they can possibly be delivered to the end that they (the smelters) may reap all the profits derivable from the mines.

#### Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

##### REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

L. McLAINE.

Any good blacksmith can put this lock on safe doors. Bored or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast Directory.] A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

#### Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

##### BANK OF BRITISH COLUMBIA.

San Francisco, May 24, 1866. }  
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILTINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several times to Vaults and Safes, to entire satisfaction of the parties interested.

KITTREDGE & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867. }  
I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMES,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHEPMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHEPMAN, County Clerk.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the *Press* several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1866.]

They are the only SAFE LOCK ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which it was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKT & C. FLEISHEL,

1974my11&13.1am No. 18 Post street.

## Notices to Correspondents.

A SHAFT SINKER may rest assured that the mode described in our number for the 27th ultimo, which was first adopted by M. Triger for penetrating water-saturated and porous strata, is not only perfectly safe and practicable, but we learn by some European exchanges, received since the former article was written, that the example has been followed in other places. Advertising to M. Triger's system, Prof. Smyth, in a recent lecture at the School of Mines, London, has furnished the following interesting particulars: "Many scientific men said the idea could not be carried out in practice; and, amongst others, the Academy at Paris gave the matter their serious consideration, and came to the conclusion that it would have a most prejudicial effect on the health of the workmen; but M. Triger, to show his confidence in the system, had taken his turn at the work himself. At a depth of eighty-two feet from the surface, however, the men engaged in the operation seemed to get to a sort of equilibrium; they had got to as high a pressure as they could bear, and yet scarcely made any head against the water. If they put on a higher pressure, the air was forced through the adjoining strata, and rose in bubbles to the surface. By some means, however, the watery bed was successfully passed through, and then, a water-tight joint being effected, all difficulty was at an end. This method had since been adopted in several instances, but it was necessary to be very cautious at certain points. One difficulty which had been experienced was, that if there was very great pressure below the air chamber, the latter would be forced up the shaft, and hence one or two rather awkward cases had occurred in which it had been forced upwards, and borne with it a quantity of tubing which had been completed. This had been remedied by keeping the air-chamber very near the surface, and laying across it very strong iron beams, and weighting it with pig iron. Another serious matter in connection with it was, that in consequence of the great accession of oxygen in the compressed air, it created a tendency to combustibility; and hence the candles used by the men burnt away very fast; and several accidents had occurred, owing to this property of the air, which had not been thoroughly explained—an explosion having occurred in one case and a man hurried to death in another. It had been stated that several men had died who had been engaged in the works at the Albertbridge, Plymouth, where this method had been adopted; but he felt bound to say that M. Triger's evidence went distinctly to prove that if the men were taken proper care of, and were not accustomed to drink, no inconvenience would result; but their health might be affected if they were taken too suddenly into the open air; consequently he made it a rule to make the change from the shaft to the surface very gradually. M. Triger had told the lecturer himself that he had remained in the shaft a considerable time subject to a much higher pressure than any of the workmen—even as much as four and a quarter atmospheres, or 68½ pounds to the square inch.

COMMUNICATIONS RECEIVED.—"Mining at Virginia City and Austin," by Dr. DeGroot; "Revolving Calciners," by Prof. Chas. S. Richardson, of New York; "An Explanation of the Pewabic Electric Phenomena," by F. A. Herring.

## Quicksilver Production in California.

The various products of our State, whether obtained directly from the howels of the earth or from its prolific surface, or whether produced by the handicraft of our mechanics and fabricated at our doors, as articles of necessity for immediate use, or as aids in developing some other branches of industry, have ever received notice and encouragement in the columns of the PRESS, in some measure proportionate to their value and usefulness. Whatever production enables us to go to market and obtain that which we require, is fully equal, according to its value, to so much gold and silver produced from our mines.

No country, state or people, can long stand a drain on their circulating medium to pay for products from abroad, unless engaged in some more remunerative occupation at home. Cotton was once the great staple of the United States; but the price of that article has of late become so high, and its product so small, that our people have for several years been compelled to look to other sources for a medium to equalize their foreign exchanges. The mines of the Pacific coast seem to have come in most opportunely to relieve the country from what, during our late domestic strife, threatened to become a most serious embarrassment. The product of our mines, shipped abroad, places us on the best of footing for purchasing in any market, and whatever tends to curtail that product, no matter how trivial in extent, must be looked upon in the light of a public calamity, to be measured by the effect produced. It is upon gold and silver, chiefly, that we must rely for the means to pay the interest on the national debt, which now amounts to a sum more than three-fold the total of our ordinary expenses before the War of Rebellion.

In the production of gold and silver bullion, quicksilver is an article of indispensable necessity; without it our mines could not be developed, and the government would be deprived of its most ready and almost only available means for meeting the interest upon the national debt, for which the faith of the nation has been pledged. A low price for quicksilver will cause a greatly increased consumption of the article, and a corresponding increase in the production of bullion. Hence, one of the most effectual means to increase the yield of gold and silver is to decrease the price of quicksilver; and he who effects this object must be looked upon as a public benefactor; while, by parity of reasoning, he who unnecessarily advances the price, must be regarded as anything but a philanthropist or patriot.

These reflections have naturally grown out of a careful perusal of the recently published annual report of the Quicksilver (New Almaden) Mining Company. This report is certainly a most suggestive document. It appears therefrom that the company is at present engaged in executing a contract with Mr. W. E. Barron, for the delivery of fifty thousand flasks of quicksilver, at \$30 per flask. This quicksilver, when delivered in London, will cost Mr. Barron about forty-five cents per pound. He will probably sell it for about fifty-two cents—the present price in that market; so that a miner in England will obtain California quicksilver, which has traveled 18,000 miles, for eight cents per pound less than a California miner pays for the same article within fifty miles of the mine where it was produced! A short time since, our miners were paying seventy-five cents; but the price has recently been reduced to sixty cents. California miners must feel grateful for the concession—by which they have now to pay only ten cents more on the pound for quicksilver, instead of twenty-five cents, as formerly, over what it can be bought for in London.

But the report says there has recently been a decline in the price of quicksilver, in London, of about \$5 per flask. We have not heard of it through any other source.

If such is the case, however, perhaps some of our merchants may find it for their advantage to go to that city instead of to the agency in San Francisco, for their supply of Almaden quicksilver.

The report shows that the actual cost for mining, assorting and retorting, is \$16.15 per flask, to which amount is added \$7.60 for interest, permanent improvements, taxes, etc., making the actual cost \$23.75 per flask. Hence, it follows that any party who can produce quicksilver at a cost not exceeding \$23.75 per flask, can safely enter into competition with the Almaden company.

There appears to be a few more figures connected with this report, which are eminently suggestive. Taking the figures in this report to be correct, the average yield of the ore for 1866 was 11.62 per cent., and 13,442 tons were treated. This would probably involve the raising of not far from 40,000 tons, (as the dump pile or *tierra* would seem to indicate that about two-thirds of the ore raised is thrown to waste.) The total cost of producing 35,150 flasks (the yield of 1866) is set down at \$567,711. The cost of furnace work is not separated from the cost of mining; but by no fair estimate can the cost of treatment at the furnaces be set down at over \$15 per ton, which would leave \$366,081, or \$32 per ton of 2,000 pounds, as the cost for each ton of assorted ore, or a fraction over \$10 per ton for every ton of ore as it comes from the mine; this, it will be recollected, includes the cost of assorting after it is brought to the surface. As the Superintendent suggests that there should be at least \$10,000 per month expended for *dead work*, or "prospecting, and making communication between the different workings of the mine," we should naturally assume that there is a less amount now expended, than the sum asked for. It will be interesting to compare the cost of raising ore at this mine with that of one of the principal mines in Virginia City.

By reference to the last annual report of the Gould & Curry Co., we find that the total cost of raising the ore from that mine for 1866 was a fraction short of \$8 per ton, (no account being taken of waste rock), while the amount of *dead work* performed exceeded \$23,000 per month! The amount of ore raised was 62,424 tons. Perhaps the disparity in cost of raising ore at the two mines may be owing to the difference in the class of labor employed. We think any miner who has visited both mines would say, that with the same amount of *dead work*, ore might be raised from the Almaden at much less than the cost necessary at the Gould & Curry. We may possibly greatly err in judgment, but at all events figures thus deducible from the report are certainly suggestive. There is also a lack of particularity in the report, as compared with mining reports generally, which is especially noticeable.

As intimated at the outset of this article, the production of quicksilver at the cheapest possible rate is a matter of public interest to this State; and it is from that fact alone, and not with the view of mere fault-finding or excess of curiosity, that we have thus (and possibly harshly) reviewed the report before us. It is to be feared that the publication of the report may operate to unreasonably deter others from entering into the production of this metal, who, by a proper and economic management might greatly increase the quicksilver yield of this State, and possibly materially reduce its price—either of which would be a great boon to the miners on the Pacific coast.

We would take this occasion to mention, as a decided encouragement for any persons who may think of entering into this business, that we have the best of reasons for believing that a great impetus will soon be given to the production of quicksilver through the agency of a new furnace for obtaining the same from the ore, recently invented by Messrs. Coult & Roach of this

city, and for which letters patent have been obtained through the Patent Agency connected with this office. Various samples of ore, from different localities, have been treated in a test furnace, erected to prove the principle, which have shown that the invention possesses most important merits, and that it is capable of effecting a decided saving over what appears to be the cost of obtaining the metal by the furnaces usually employed. With Messrs. Coult & Roach's furnace, less than two per cent. ores can be profitably treated and higher grades at a proportionate profit. We feel quite confident that with this improved furnace and a reasonable degree of economy in the mining department, ores can be made to pay largely that do not average one-third as much as those at New Almaden. This furnace is free from the objections which render those in present use deleterious to the health of the operators, while the amount of fuel required is less. The quicksilver is so volatilized and condensed that it is almost a matter of impossibility for a particle to escape into the outer atmosphere. This furnace is much less costly, and more convenient for management, than those now in general use. We cannot refrain from expressing the belief that its introduction on this coast will effect a complete revolution in the production of quicksilver, and give value to deposits of that mineral which cannot possibly be worked to a profit under the present expensive system.

## Foundry and Machine Work.

The foundries and machineshops throughout the State are now pretty generally full of work. During the past week we took a look through the Pacific Foundry, in this city, which establishment has been unusually driven of late—so much so that they have been obliged to run much of the time both night and day. In passing through the shops, we noticed a large amount of very heavy work being done there. The engine and boilers for the new Government steamer, now being built for the Quartermaster's department, are in quite a forward state of progress. This boat will be 100 feet length of keel, ten feet depth of hold, and twenty-one feet beam. She will be driven by a 250-horse power engine. All the modern improvements connected with marine engines and boats will be introduced into this steamer. Her cylinders will be partially steam-jacketed, and the whole engine will be of massive build for one of its class. She will have two fire-box boilers for making steam.

The large engine for the new rolling mill is also in progress of construction at this foundry. This will be one of the largest horizontal engines ever built on this coast. The cylinder will be twenty-five inches in diameter by three and a half feet stroke, and will be fully steam-jacketed. The fly-wheel will be twenty feet in diameter, and will weigh twenty tons.

The Petaluma steamer's shaft, which was recently broken and built up again at the Pacific Forge Company's works on Mission creek, was in the lathe as we passed through the machine shop. The America's broken shaft, which was recently rebuilt at the same forge, was also finished at this foundry.

## QUARTZ AND OTHER MILLS.

Among the other work in progress at this foundry is a ten-stamp mill for New Mexico, which is about ready to be sent off. Also, a ten-stamp cement mill for Forest Hill. This mill will be put up on a claim recently purchased by a San Francisco company.

A ten-stamp mill, with an iron hurdy-gurdy wheel, is also being built here for a location in the Humboldt river country, near the Oreana company's silver smelting works. A set of Varney's pans go with this mill.

A sugar mill, with engine, boiler, etc., has just been sent out from this foundry for a plantation in Tahiti.

They are also constructing the engine,

boilers, etc., for a flour mill, with four run of stones, now being erected by Coffin & Staudish, near Martinez, opposite Benicia.

They have also under way the machinery for a plant of smelting works, for argentiferous galena, to be put up by Gen. Banning & Co. in Sonora.

A lot of 100 large ingot molds have just been sent out from this foundry to the Orona Smelting Works, in Humboldt. Some idea of the immense amount of metal which is being turned out at these works may be inferred from the fact that when this order was sent in they already had 100 molds at the works, which have been found insufficient for their needs. By using even that large number, it has been found impossible to keep a sufficient number of cool ones by to receive the metal as fast as it is produced. Hence the last order of 100 additional.

A large lot of Varney pans are being finished off for the New York and Owyhee Mining Company, Idaho.

Several freight cars are being built for the Oregon Steam Navigation Company's Railroad, connecting the boats of this company above and below the rapids on the Columbia river.

Mr. Austin, the well known superintendent of these works, is the inventor and patentee of a most efficient quartz crusher, which is made and sold at this foundry, and which has elicited high commendations from various practical quartz millmen who have seen it in operation.

**A PLEASANT PLACE OF RESORT.**—We know of no place of resort in this city where a few hours may be more pleasantly or more profitably spent than at Woodward's Gardens, on Mission street. Both the Market and Howard street cars pass within a few rods of the entrance; and when once there, he or she who cannot be most agreeably entertained for an hour or two, or even several hours, can have but a very poor appreciation for the works of either nature or art. The proprietor of these gardens has had the good taste to secure his visitors from everything which can annoy even the most fastidious; for this reason it has become a most popular place of resort—even ladies, unattended by a male escort, can go there with the most perfect freedom from annoyance, and spend, if they like, the entire day. Strangers visiting the city, from the interior or from abroad, can nowhere spend a leisure day with more rational enjoyment than at these gardens.

**SAFETY OF PUBLIC ASSEMBLIES.**—The Legislature of Pennsylvania has passed some stringent laws with regard to the convenience of egress of public assemblies in case of fire. In addition to doors of common construction, the custom of blocking up the passages and doorways with chairs and benches is especially forbidden. That is as it should be. Our own Legislature should act in this matter. The manner in which the passages were blocked up at Union Hall, in this city, during the union prayer meetings, last fall, should never again be allowed.

**THE BILLIARD TOURNAMENT,** under the auspices of Messrs. Hughes & Strahle, the celebrated billiard table manufacturers, is now in progress at Congress Hall, Bush street, near Montgomery, in this city. The room has been fitted up especially for the occasion, and a large number of strangers and scientific billiard players are in attendance from various parts of the Pacific coast.

**HEAVY TELEGRAPH BUILDING.**—A great part of the first 800 miles of the Russian Extension Telegraph, north of New Westminster, is through a timber country filled with pines, some of which are 15 feet in diameter and 300 feet high. A swath 22 feet wide was cut through this timber, and the line placed upon poles standing in the middle of the open space.

## Home Trades and Manufactures.

**COFFEE AND SPICE MILLS.**—The business of preparing coffee and spices for the table is no insignificant portion of the manufacturing interest of San Francisco. They are now nine in number, chief among which we may mention the establishment of Charles Bernard, to which was awarded the first premium of the Mechanics' Institute, at their Fair for 1865. It is located at No. 708 Sansome street, and is one of the most extensive and complete in all its details of any similar establishment on the coast. We have already, in past issues of the Press, noticed this mill at length, giving a full description of the *mola operandi* by which the coffee berry and various spices are prepared, ground, packed and labeled for the market. Everything about this institution is neat and orderly, and the reputation of its coffee, in particular, stands No. 1 throughout the State. Very few people have any idea of the extent of this business. This single establishment has turned out 235,000 pounds of roasted coffee during the past year, in addition to pepper, ginger, cloves, mustard, etc. A large portion of this stock is disposed of in this city, although much of it finds its way into the interior of the State, and into Nevada, Oregon, etc. This establishment is well worthy of a visit from all who take an interest in the various manufacturing enterprises of our growing city.

**STEWART'S AIR-TIGHT COOKING STOVE.**—Prominent among valuable patents is ranked that of the Stewart air-tight cooking stove. For nearly twenty years this improved fuel-saver has maintained its leading position in spite of hundreds of other patents, many of which, we doubt not, possess their individual merits.

The Stewart stove is represented most extensively on this coast by Mr. Caleb M. Sickler, at 422 Kearny street, from whom we learn that, in all probability, half a million have been disposed of in the Eastern States and on this coast.

As a detailed description of these stoves may be seen by referring to the cover of the Monthly Series of the MINING AND SCIENTIFIC PRESS—copies of which are always to be found on the tables of the leading hotels and reading rooms of this city, and on the ferry-boats, steamboats and steamships running regularly from our wharves—we will only allude to one or two points for the sake of some readers in the interior. In addition to the advantages claimed in point of economy and durability, they possess a high degree of value as to the mode of ventilation—the front doors open directly into the oven, and thus secure a draft through the top of the same by means of perforated holes in the doors and back flues. The heat is not only controlled at pleasure—either being retained for use within the oven or thrown into the room, as circumstances require—but also, by means of a double-sheet bottom flue, may be made as even and efficient as could be desired.

The facilities they possess for supplying hot water for bath-rooms and other purposes, are equal to those of any range.

**HINKLE & CAPP'S IMPROVED AMALGAMATOR.**—In this machine, for which a patent was issued April 16th, 1867, the grinding is accomplished by means of a perpendicular grinding surface formed by the side dies being arranged against the walls of the pan; also by the peculiar shape and arrangement of the cover; by which a continual flow of the ground pulp from the circumference to the center is secured. It is so constructed that it may be made to work continuously from the battery, when desired. The improvements claimed are, 1st, The employment of renewable side dies; 2d, the use of perpendicular muller hangers, hung loosely on pins upon the arms of the central cone, and pressed laterally by centrifugal force against the perpendicular grinding surface, by which arrangement the pressure is light-

est at the feeding point, and heaviest at the heel, where the chief part of the grinding is done. These machines are said to be very effectual, wherever they have been introduced as triturators; always adapting themselves to their work, and requiring but a small quantity of power in proportion to the amount of work done. We hope to be able to give an illustrated description of this machine at an early day.

**GOODWIN & WEST'S REVOLVING CENTRIFUGAL CONCENTRATOR,** can be seen by millmen and others interested in the working of sulphurets, at the Franklin Foundry, Fremont street. One of the inventors, at least, will be on hand to exhibit the mode of working, and set forth the merits claimed for their invention.

**METALLURGICAL WORKS.**—We have received the business circular of Messrs. Secor, Swan & Co., proprietors of extensive metallurgical and chemical works at 336 and 338 West 28th street, New York. This firm gives special attention to the assay and analysis of mineral, waters, etc. Gold and silver ores are also worked in parcels of 500 pounds to ten tons.

**JACOB SIKK, Pioneer Photographer,** 512 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 15v14tf

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One in operation at the San Francisco Foundry, Fremont street, where rights can be procured, or all needed information, on application, in person or by letter, to 5v14-ly AUSTIN A. WELLS, Agent.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *rubic* teeth—thus restoring them to their original usefulness and beauty. 5v14-ly Call and examine the work. Finest quality of artificial work also manufactured. 15v14 tf

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by D. H. WOODS, No. 28 Third street. 15v14tf

**Allen's Lung Balsam.** Remarkable cure of the daughter of Robert Lawrence, Esq.: NEWPORT, Ky., June 1, 1863.—Gentle—I will give you a statement of the wonderful medicinal properties of ALLEN'S LUNG BALSAM. My daughter was attacked with a cold, which settled on her lungs. A severe cough was the consequence, which so harassed her that she became much reduced. She had great pains in her side and breast, attended with cold chills and night sweats. She raised more than a pint of matter a day. Finally her lungs became ulcerated; her hands and feet were cold and clammy as death. Her physician, having failed to give any permanent relief, said that he could not do anything more for her; that she must soon die. At this time I procured Allen's Lung Balsam, which caused her to raise large quantities of matter and phlegm. When this was expectorated, her appetite and strength gained rapidly, and her cough in a short time ceased; and now she is a most extraordinary trophy of the medicinal properties of Allen's Lung Balsam. Respectfully yours, ROBERT LAWRENCE. Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle. Sold by all Medicine dealers everywhere. 15v14-1m

## The People's Friend—Perry Davis' Vegetable Pain Killer.

The greatest Family Medicine of the age! Taken internally, it cures sudden Colds, Coughs, etc., Weak Stomach, General Debility, Nursery Sore Mouth, Canker, Liver Complaint, Dyspepsia or Indigestion, Cramp and Pain in the Stomach, Bowel Complaint, Painters' Colic, Asiatic Cholera, Diarrhoea and Dysentery. ## A. S. Hallidie & Co., MANUFACTURERS OF FLAT & ROUND WIRE ROPE, For Mining, Shipping, Ferry, and GENERAL PURPOSES.

Office—412 Clay street, San Francisco. Works—North Beach. NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner. The attention of Mining Companies is particularly called to our Flat and Round Mining Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life. Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope. We manufacture of all sizes, and in any length—Round Wire Rope—Iron or Steel, for Hoisting. Flat Wire Rope—Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes. Steel Ferry Ropes—For wide streams. Ferry Blocks supplied. Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$  inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand. Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

**D. CAMERON.**

6v12-ly

**MINE EXPLOSION.**—The Downieville Messenger chronicles a recent explosion in the Combination Co's tunnel, at Wet Ravine, as follows: The men who were driving the main tunnel struck into an old drift which had been run by another company, about ten years ago, and after opening into it, one of them went in and on raising his candle near the top, an explosion instantly followed, similar to setting off powder in the open air, and the whole tunnel was in a flame of fire. The man immediately jumped down into the main tunnel and barely escaped being burned, although considerably warmed up. Fortunately, the main tunnel was about five feet lower, and the fire confined itself to the old tunnel. There were several men at work on either side of the main tunnel, and near the place, and had it been above the fire, instead of below, they must have all perished.

The flame appeared to be very much like that produced by the burning of alcohol. It continued burning for about half an hour, and then went out. But in a short time, it was cautiously fired again by placing a candle on the end of a stick, when a like explosion took place and the flames increased. The third time it was fired, the report was still louder and the fire stronger, when it was determined to beat a retreat from such a dangerous locality.

**EXTENSIVE FILTERING.**—Telford Macibell, says the London Lancel, has a project for filtering the Thames water by conducting it to the Bayshot sands, and spreading it over them. By means of canals it is then to be gathered again, and afterwards distributed by the various water companies throughout London. Two hundred millions of gallons daily is required. The area of the filter is twenty-two and a half square miles.

**A LAND OFFICE BUSINESS.**—Thirty-eight thousand acres of public lands were disposed of in March at the following Land Offices in California: 26,500 at San Francisco; 2,500 at Stockton, and 9,000 at Marysville.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**RAPID PROGRESS.**—The Summit tunnel on the Central Pacific Railroad, is to be 1,660 feet long. It was commenced last September, says the *Bee*, at four points—the two ends and two faces, which were created by a shaft in the center. It has been worked night and day; and on May 1st but 681 feet remained to complete it, although it was expected that three or four years would be consumed in the work. At this rate it will be finished by the first of August.

**WORTH A TRIAL.**—A correspondent of the *Country Gentleman* asserts that red cedar twigs bound around the bodies of fruit trees, butts upwards, will effectually protect them from insects. Col. Dewey of Hartford, writes to the *Horticulturist* that in his vineyard, grapes trained upon red cedar posts and trellises are free from mildew and insects, and those growing closest to the posts have the most healthful appearance and are the most productive.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit.

Orders will be received at the office only for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed.

## BLAKE'S PATENT QUARTZ CRUSHER.

## CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1865.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE &amp; TYLER, Agents for the Pacific Coast.

TO VICTIMS OF RHEUMATISM IN

ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH

this terrible and excruciating disease, that the means

of a safe, speedy and permanent cure are within the reach

of every sufferer, by using

RICHARDS' REMEDY!

For Inflammatory, Chronic, Hereditary and Mercurial

Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and

the modifications of the disease, whether confined to one

portion of system or erratic in their character. Composed

wholly of VEGETABLE EXTRACTS, it exterminates the

tormenting humors, restores strength, returns health and

hope to the pain-worn and debilitated patient, and

cures, nothing but the grossest imprudence can lead

to a relapse. The confidence with which these statements

are made to the public, is the result of many years' ob-

servation and experience. The reputation of mere pal-

latives soon dies out, but that of a STEERING MEDICINE,

which produces, year after year, in all cases, the same ben-

eficial effects, NEVER DIES. This has been the history of

Richards' Remedy. Try it!

RICHARDS' REMEDY is for sale by

H. BOWMAN, Druggist, Sacramento.

And by Druggists generally.

ENLARGEMENT  
OF THE  
American Journal of Mining

Volume III, commencing March 3.

In consequence of the remarkable success that has at-  
tended this Journal, the proprietors feel warranted in in-  
creasing its size to

Twenty Pages.

Thus making it the LARGEST and most COMPREHENSIVE  
Mining Journal on this continent, representing the Gold,  
Silver, Copper, Iron, Lead, Coal, Salt, Oil, and in fact all  
the Mineral interests of America, containing beautiful en-  
gravings, illustrating the latest improvements in mining,  
mining and metallurgical machinery.

The Journal has won the encomiums of the press of the  
entire country and Europe, and numbers among its con-  
tributors more eminent scientific men than any other  
weekly publication in America.

The reports of the markets in stocks, metals, minerals  
and ores, carefully corrected weekly are an important fea-  
ture of the Journal.

Subscription \$4 per year; for six months, \$2.25—in ad-  
vance; single copies, 10 cents. Specimen copies sent free.  
Address, WESTERN COMPANY,  
17v14-4t Publishers, 37 Park Row, N. Y.

TIE CELEBRATED

Self Generating Portable

Gas Lamp.

This extraordinary Lamp produces its own gas by the vapor-

ization of Petroleum, Naphtha,

or Benzine. It emits neither

smoke nor smell, and burns with

a pure white flame, equal in in-

tensity to an ordinary gas burn-

er, and at an expense of from one

to three cents per hour only, ac-

cording to the quantity of light

required. It is peculiarly adapted

for mining purposes, also for

stores, factories, billiard rooms,

and, in fact, for all purposes

where regular gas is not availa-

ble, and for which it is an ad-

mirable substitute. As an out-

door light, it stands unrivalled,

burning with undiminished bri-

lliance in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with

Benzine, from half to three-fourths full; allow a portion to

run through into the cup, then turn off the tap and ignite

the fluid, which will heat the burner sufficiently to gener-

ate the gas, which will be seen issuing from the top. The

tap must now be turned on, and a steady light will be main-

tained till the whole of the contents of the reservoir is con-

sumed.

A small needle, bent at the point and fixed in a holder,

may be occasionally required to clear the minute hole

through which the gas issues, and the regulating screw at

the bottom turned a little back; but care must be taken not

to force the screw too high, and it should never be used to

extinguish the light—by turning the tap off, it will gradually

go out.

When necessary to renew the cotton which is placed in

the lower pipe to prevent the too rapid flow of the fluid, the

lamp should be placed in a vise and the burner screwed off

the burnt cotton must then be withdrawn, and a fresh

piece of stout cotton rag, one inch wide and four or five

inches long, should be doubled over a piece of wire, and

inserted into the pipe—the ends cut short off, the burner

again screwed on with a little white lead, and the lamp is

ready for use.

Manufactured solely by JOHN J. HUCKS, original prop-

rietor. Factory, North Beach, San Francisco; and for sale

by his agents in every city and town throughout the State.

## PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better prepared to receive and secure the claims of our applicants, in a careful, prompt and efficient manner.

DEWEY & CO., Patent Solicitors.

## Camargo Gold and Silver Mining Company, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of February, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate	No. Shares	Amount
Camp, Jas.	74	5	\$100.00
Crunkhouse, J. A.	5	5	60.00
Dirnkupfel, L.	7	5	60.00
Harker, W. B. C.	21	10	200.00
Harker, W. B. C.	24	10	200.00
Harker, W. B. C.	134	3	60.00
Jacobs, S. B.	135	1	20.00
Fransell, J. C.	132	1	20.00
Gray, Asaph	131	3	60.00
Lander, H. C.	69	5	60.00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of February, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, Auctioneers, on the 21st day of May, 1887, at the hour of two o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar30

## Dianna Gold and Silver Mining Company.—Location of Works: Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-second day of March, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Names	No. Certificate	No. Shares	Amount
H. H. Allen	276	3	\$15.00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-second day of March, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Jones & Bendixen, at the office of the Secretary, corner Front and Clay street, San Francisco, on the fourth day of June, 1887, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, northeast corner Front and Clay streets, San Francisco. myll

## De Soto Gold and Silver Mining Company.—Location of Works: Star District, Humboldt County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of April, 1887, an assessment of sixty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 58 Exchange Building, northwest corner of Montgomery and Washington streets, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the first day of June, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the nineteenth day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 58 Exchange Building, northwest corner of Montgomery and Washington streets, San Francisco, California. ap27

## Evoca Consolidated Copper Mining Company.

Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, for the election of Trustees, will be held on THURSDAY, the twenty-third day of May, 1887, at 3 o'clock P. M., at No. 532 Merchant street, Room No. 3, San Francisco, California. By order of the President.

R. S. CLYDE, Secretary.

## George Washington Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of April, 1887, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of April, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Olney & Co., 418 Montgomery street, San Francisco, Cal., on the third day of June, 1887, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. O. WOOD, Secretary.

Office, 338 Montgomery street, San Francisco. mll

## Hope Gravel Mining Company.—Location of Works and Property: Orass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of April, 1887, an assessment (No. 14) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 529 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twenty-second day of May, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v14tf

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam boilers, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
**PACIFIC FOUNDRY,**  
1v1 San Francisco.

## QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

## First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or  
**J. B. HUTCHCOCK,**  
19v14-3m Millwright, Russ House.

## FOR SALE!

**PATENT RIGHT OF HUNT'S WINDMILL** for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable. Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

**E. O. HUNT,**

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.** The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low rates: No. 1.—10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600 No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour. 550 No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour. 1,200

**EXPLANATION OF THE ABOVE ENGRAVING.** The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.  
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly crushing quartz for the stamps. Yours truly,  
R. P. JOHNSON,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the advertiser.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the advertiser.

A drawing and full description of this machine will be found in the Mining and Scientific Press, Sept. 1st, 1866.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street,  
12v13tf San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber facing, which is secured to the bottom of the Valve by a washer and secured to the entire circumference of the Valve. The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water. Rights for the use or manufacture of this Valve, are for sale by

**V. CUSHING,**  
120 Front street, San Francisco.  
These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.  
See illustration and description of this Pump, published every other week in this paper. 14v14qtf

**Notice to Miners,**  
**Well-Borers and Water Companies.**

**M. PRAO** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

**M. PRAO,**  
8v13-ly Stove Store, No. 125 Clay street, below Davis.

HUNTER'S  
Eureka Amalgamator!

**FOR WORKING THE SANDS AS THEY PASS FROM** the battery. The coarse particles of sand are reduced to pass through a No. 6 screen that would pass through a No. 5 in the battery; the fine flour gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The machine is four feet eight inches square on the bottom, and covered with iron dies 1 1/2 inches thick by four inches wide, extending across the bottom with alternate strips of wood on end of the same width. The rubbers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between rubbers. The box is also lined with copper plates. The machine is set in operation by eccentric, giving an oscillating motion; and the rubbers are suspended on iron hangers, and adjusted by set screws. One-fourth of a horse-power is sufficient to run one machine of ten tons capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from WM. WATT, Esq., of the Eureka Mill, will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is from rock that pays \$40 per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I have ever seen. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it; but the best recommendation I can give it is that I want four more. Will you please go to the Vulcan Foundry and order them." 14v14

On the 1st of April I had an order for two more, for the Pittsburg Company at Nevada City.

The price for a Machine with rubbers made, and dies and wood set in the box, and all the iron work, is \$275. The weight is about one ton with cast iron box; but to save freight, the box can be made of boiler iron, saving 500 pounds weight.

Orders sent to the Vulcan Foundry, the Union Foundry, or the Fulton Foundry, First street, will be promptly attended to.

**ANDREW HUNTER, Patentee.**  
P. S.—Patent allowed.

HUNTER'S  
IMPROVED CONCENTRATOR.

**THE INVENTOR OF THE ABOVE RECENTLY IMPROVED** Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the value of the metal recovered, and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if delivered for shipping, will contain less than one per cent. of sand.

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs. 14v14

## To Quartz Miners and Others.

## NOTICE!

**I WISH TO CALL YOUR ATTENTION TO A PULVERIZER** of my own invention, which I have called the **HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention will be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 14v14-3m

JAMES HITCHENS.

STRONG & CO'S  
CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Mullers, Rolling Shoes and reverse action.

Millmen and others are cordially invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by  
22v13 G. W. STRONG, Assayer.

[Written for the Mining and Scientific Press.]  
Mining Experiments at Wisconsin Hill.

**MESSEURS, EDITORS:** During a recent visit to the interior, I had the opportunity of performing some practical experiments on "Cement Gold" at the Oriental mill, situated at Wisconsin Hill, Placer county, for the purpose of ascertaining the value of the claim and establishing a method for saving the gold; the result being highly satisfactory, I will proceed to lay it before your readers.

The company's claim covers an area of more than fifty acres, and includes the greater part of the town of Wisconsin Hill; a portion of the claim having been washed off by "hydraulic" means, leaves the "cemented gravel" exposed to view; it varies in depth from below the "bank" to the bed-rock, from five to thirty feet. All this mass of cement, is auriferous and suitable for milling purposes. The grains of gold (dust) vary in weight from ten grains to 5-100 of a grain; its fineness averaged 921 fine, in value about \$19 per ounce. The mill hands not being experienced, used coarse screens and a too copious supply of water during crushing; the result was that nearly the whole of the gold passed through the screens, was washed out of the mill, and lost; thus involving the company in debt, from which they have been extricated by the timely purchase of a part of the claim by some gentlemen of San Francisco. I may here mention that some of the gold exists in the state known by the miners as "rusty" gold—that is, it is coated with sesquioxide of iron, being the result of the decomposition by atmospheric influence of the sulphurets of iron, which exist in the state of minute crystals, disseminated through the conglomerate mass. These sulphurets are not auriferous.

I commenced the experiments with screens having the perforations one-eleventh of an inch in diameter, using a small head of water just sufficient to carry off the sands, crushing at the rate of four tons per stamp every twenty-four hours, (the stamps weighing about 600 pounds, drop ten inches, sixty-five times per minute). The result was 68.10 per cent. obtained in the batteries, 8.74 per cent. on the copper plates, 11.70 by pan amalgamation, and 11.46 per cent. left in the tailings. A series of these experiments were performed on cement from different parts of the claim with similar results; that obtained in the batteries varied from 63 to 74 per cent. while the yield was from \$2.20 to \$23.73 per ton.

Screens known as size No. 1, were then used, when all the gold was obtained in the battery and completely coated with quicksilver, except about the amount of ninety cents in value that was found on each of the four tables, per week, being about one cent in value from every ton of cement crushed. The experiments were successively repeated with the same results. The twenty stamps crushed at the rate of sixty tons of cement, from which the greater part of the larger stones had been separated, every twenty-four hours. It being desirable to crush even a larger quantity, an experiment was made with a screen of the same size placed at an angle of ten degrees, the top projecting outwards—result, 30 per cent. more crushing in the same time. With this last improvement, the crushing capacity of the mill will be eighty tons every twenty-four hours, the whole of the gold being obtained.

The sands from the batteries during these final experiments, were submitted to a careful pan amalgamation, and to a series of fire assays. Result—Slight traces of gold in each case not exceeding the value of a few cents per ton.

The claim is worked by twelve miners, who are employed in two of the tunnels, and sixteen Chinaman who work on the surface. The works, which are under the superintendence of Mr. Daniel Hosmer, are so contrived that a full supply of pay cement can be delivered in the mill during the twenty-four hours of the day—the surface cement at thirty cents, that from the tunnels about \$1.25 per ton; cost of milling, a trifle over fifty cents per ton. Mill capacity about 2,000 tons per month, equivalent to between 3,000 and 4,000 tons of the mass as it is extracted from the claim. Respectfully yours,

JOHN SCOTT, Metallurgical Chemist.

The cigar ship, Ross Winans, has recently made a successful trip in the English Channel.

**How DEEP CAN SHAFTS BE SUNK.**—The question occurs to the miner who sinks down a shaft for three or four hundred feet, "how far might I descend without being burnt out, or froze out; and which?" The student of natural science, who adopts the theory of internal heat, and recognizes, as correct, the present observed rate of increase of temperature with depth, would answer as follows: Water would boil at the depth of 2,430 yards. Lead would melt at a depth of 8,400 yards. Red heat would obtain at the depth of seven miles. Gold would melt at the depth of twenty-one miles.

The toy marbles, which afford such a large proportion of the daily amusement of the boys, are chiefly made in Saxony. They are chipped into cubes from a hard enclareons stone by the hammer, and then placed in concentric furrows cut in a fixed slab of stone, over which a platform of hard wood is revolved, while water is kept flowing on the stone. A very few minutes serves to give the cubes the form of perfect spheres.

**A LUCKY MAN.**—The *Amador Ledger* says that Mr. David Robinson, a ranchman, living three miles north of Volcano, picked up a nugget of gold, about a year ago, worth eight or nine hundred dollars. The same man, a few weeks since, *plowed up* a package containing nearly nine hundred dollars. The last amount had probably been buried by some one who has since died without revealing the secret of his deposits.

**WHAT IS IT?**—The *Pottsville Standard* says that in the vicinity of Orwigsburg there exists a peculiar substance, formerly called "Orwigsburg coal," which bears some resemblance to plumbago, or black lead, and has been used for many years by carpenters and others instead of lead pencils, by merely sharpening it at the point. It makes a distinct mark, is soft, and not at all gritty.

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*; or address DEWEY & VAUGHN, *Mountain Messenger* office, Downsville, Sierra County, Cal. 7v14lf

#### WOODWARD'S GARDENS! MUSEUM,

Art Galleries, Conservatories and Zoological Grounds, On Mission and Valencuela streets, between Thirteenth and Fourteenth streets.

#### Open Every Day!

ADMISSION: To all parts of the Gardens.....25 Cents. Children, under 12 years of age.....Half Price.

NEW ATTRACTIONS are being constantly added to all departments. These Gardens are accessible by the Howard, Folsom and Market street Cars. Schools and Charitable Institutions, accompanied by guardians, free on Mondays and Fridays. 23v13qr

#### HAYWARD, COLEMAN & CO., IMPORTERS AND REFINERS

#### Illuminating, Lubricating, PAINT OILS!

CONSISTING OF KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', SEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

#### SPIRITS OF TURPENTINE & ALCOHOL

Now—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off. A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

JOHN BENCHLEY, President.

#### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequaled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw miller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the miller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the miller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above, presses all under the miller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolita Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

## Draper's New Machine Drill.

Nicholas Draper, of Sacramento, has made application, through this office, for letters patent for an improved drilling machine, a correct representation of which is given in the accompanying engraving. The chief and novel features of this invention consist, first, in the device whereby the drill is raised by a cam and tappet, and so released as to fall and give the blow before the tappet descends, and whereby the drill may also be allowed to fall the required distance for any depth of hole, and that without altering the position of the cam, tappet, or any other part of the machinery. Second, by means of joints at H and F, and the braces, d, the drill can be inclined forward or back, so as to drive an inclined hole. The

machine can also, by that means, be folded up, so as to render its transportation more convenient. Third, an ingenious device is attached, by which the drill may be slightly twisted at each drop, so as to bore a smooth and straight hole.

The relative position of the various portions of the drill are readily seen from the perspective view herewith given. When the drill is ready for work, the point is supposed to be resting upon the rock (instead of being elevated, as in the engraving), and the tappet, D, rests upon the heel of the cam, a. In order to understand how the drill is raised, we must now refer to the sectional view of the tappet and drill stock, in the small side figure. E is a small cam, as will be seen by the axis being placed a short distance below the center, to which is attached a short lever, seen just over the letter e; e is a spring, which, pressing outward against the projection shown, causes the cam to force the drill-stock against the opposite portion of the tappet, D. Now, as the cam-shaft in the larger engraving turns, both the tappet and drill-stock will rise together, until the cam, a, is just ready to drop it. At this moment the lever, e, impinges against the top of a slot, in the guide, J, in the large engraving, by which impingement the cam, e, is slightly turned, forcing back the spring, e, by which means the drill-stock, A, is loosened from the cam, and drops to do its duty. The next instant, the tappet, D, is dropped by the cam, a, and is allowed

to slide down to the next cam, to again repeat the same process.

While the tappet and drill are being raised in close connection with each other, the arm, e, by the inclination of the slot in which it works, is made to rise at a slight angle with the perpendicular, by which the drill-stock is slightly turned. This being repeated at every blow, the drill is soon made to perform a complete revolution. The construction of this part of the machine is such that a greater or less degree of tension can be given to the drill, to suit it to the character of the rock which is being worked.

When it is desired to remove the drill to clean out the hole, all that is required is to remove the cap of the lower guide, A, which swings back on a hinge; the drill may then be inclined to the left without removing the stock from the upper guide—which swings around on a pivot to accommodate itself to the swing of the drill-stock, and at the same time holds it in position. By this device the drill is as easily removed for cleaning out the hole as an ordinary hand drill. This drill may also be used with runners for sinking to any desired depth—as for an artesian well, or boring for oil, etc.—the runners being inserted in the tappet instead of the drill. The invention appears to be simple, cheap of construction, and apparently practical. The upright posts should be about five feet high, with bottom timbers seven feet long. The entire weight need not exceed two hundred pounds.

THE LARGEST GUN IN THE WORLD.—We recently transferred the following item, from an exchange, to the columns of the MINING AND SCIENTIFIC PRESS:

"A 20-inch gun, recently cast in Philadelphia, was successfully tested with charges of sixty, eighty, and one hundred pounds of powder, the shot weighing over one thousand pounds."

The last steamer's mail brought us the following note, enclosing the item in question:

FORT PITT FOUNDRY,  
Pittsburgh, March 26, 1867.  
MESSRS. DEWEY & Co.—Gents:—The above item was cut out of your issue of February 23d. Allow me to correct you. The LARGEST guns in the world, and the only 20-inch guns ever cast, were made at these works, (owned by Chas. Knap, Esq.) SEVEN of these guns have been cast here, and are an entire success in every particular. They are all cast under the supervision of that famous foundryman, Joseph Kaye, whose experience dates back over thirty years. Perhaps the dimensions of this gun will interest you:

Rough weight.....	170,000 lbs.
Finished weight.....	116,400 "
Solid shot.....	1,000 "
Shell.....	750 "
Charge powder.....	80 "
Throw a ball.....	6 miles.
Length of bore.....	25 feet.
Diameter of bore.....	20 inches.
Diameter at breech.....	64 "
Diameter at muzzle.....	34 "

First gun cast February 24, 1864.  
Respectfully,  
O. METCALF.

INDIAN DEPREDACTIONS IN IDAHO.—According to the Idaho papers, the Indians are continually growing bolder, attacking the lines of travel, solitary miners and even mining camps. The citizens are organizing companies, in order to stop their further depredations.

## The Century Plant.

The "Century plant," as it is called, is the *Agave Americana* of the botanists. A considerable attention is being called to this plant, at the present time, from the fact that one of these extraordinary specimens of the floral kingdom is now about to flower in the garden of Mr. G. C. Potter, of Oakland.

The *Agave* has a short cylindrical stem, terminating in a circular cluster of sharp pointed leaves, some of which continue on the stem for many years. It belongs to the order *Amaryllidaceae*, and is popularly supposed to flower but once in a hundred years. The fact is that its efflorescence varies according to the climate to which it is subjected. When grown under most favorable circumstances, in its native climate, it comes to maturity and flowers in ten years. This period varies as above, from ten to seventy years, and it is altogether probable that when raised in a cold climate, and its maturity skillfully retarded, it might be kept from flowering, and at the same time vigorous for a century.

Just before flowering, this wonderful plant sends up a stem, often 40 feet high, which puts out numerous branches, forming a cylindrical pyramid of great beauty and symmetry, each crowned with a cluster of greenish yellow flowers, which sometimes continue in bloom several months. The growth of this central stem from a body which has been so long torpid is one of the most wonderful of the botanical phenomena. In the plant in Mr. Potter's garden, some sixteen days ago, a large bud or shoot was observed rising from the center of the plant. In eight days this shoot had grown seven feet—during one period of twenty-four hours it grew *thirteen inches!* The prevailing cold weather has probably rendered the growth of this flower stem much slower than it would otherwise have been, although it has now reached a height of about *seventeen feet*. It will probably reach an elevation of fully twenty feet before flowering—perhaps more. Its greatest elevation is reached only under the most favorable circumstances. And the period of its continuance in bloom is dependent upon the same circumstances. It will not bloom until it stops growing. It is exceedingly interesting to watch from day to day the ascent of this floral column. Mr. Potter has generously thrown open his gardens to the public for the benefit of a committee of ladies who are raising funds in behalf of the Oakland Congregational Church.

The *Agave Americana* is a native of the inter-tropical regions of America; but it has been naturalized in Spain, Sicily and the Barbary States. It never blooms but once; but like many ephemeral insects, the whole office of its life appears to be devoted to the sole end of the reproduction of its species; this done—its flowering having been accomplished and its seed brought to perfection, it dies, and, like the fabled Phoenix, never lives to look upon its successor.

DIAMONDS to the value of \$3,250,000 are annually sent abroad from the single port of Bahia, in Brazil.

IMPROVED HOSE CLAMP.—There are but few inventions of a minor character which carry with them so much real value as the hose clamp, invented by Mr. Hayes, a gentleman connected with the Fire Department of this city. Mr. H. filed a caveat for his invention some months ago, and has now made application for a patent. The two or three specimens of this clamp, all of which have hitherto been made, were used at the recent burning of the Cosmopolitan, and in every instance stopped the leak perfectly tight. The Department should at once order a large number of them, as we presume the inventor, now that he has applied for a patent, could have no objection to allowing them to come into general use. The mere fixing of a clamp to fire hose, is nothing new; but Mr. Hayes' improved method of fastening makes a perfect instrument of what has heretofore been of but little comparative utility.

We are pleased, in this connection, to mention that the Department have recently purchased some 2,000 feet of additional hose from Mr. Fulton, of this city. Some of this hose was submitted to a pretty severe trial a few days since, with the following results:

First Trial.—Seventeen hundred feet of hose was submitted to 150 pounds pressure without bursting.

Second Trial.—Two streams of 250 feet for each line of hose stood up to 160 pounds pressure, when one of them burst.

Third Trial.—One length of 250 feet burst at 175 pounds pressure.

Fourth Trial.—Two hundred and fifty feet of hose, same length as above, clasped with Hayes' clamp, rose to a fraction over 180 pounds before bursting.

SAVING THEIR SULPHURETS.—Some idea of the attention that is now being given to concentrating and saving sulphurets may be inferred from the great amount of machinery for that purpose which is now being purchased. The following orders for Hendy's Concentrators, are now on the books of the Union Iron Works in this city. Four for the Gould & Curry mine, Virginia City; four for the Vulture Mining Co., Prescott, Arizona; two for the Plymouth Rock Co., near Stockton; three for the Hunter's Valley Mining Co., Mariposa county; four for Francis, Valentine & Co., Sierra county, and one for E. A. Halstead, Thompson's Flat. These concentrators are made of iron, and leave the foundry ready for immediate use as soon as they reach the mine. They may be seen running at any time at the Union Iron Works.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

### The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 206.]

#### MAMMOTH DISTRICT—CONTINUED.

The next noticeable belt as we ascend westward is of limestone, and lies on both sides of the cañon, at the point in which Upper Weston is built. Here several shafts have reached the depth of one hundred feet, showing an extremely high grade of ore. Further up, near the summit, where lodes occur in slate, they are rich in both gold and silver.

From this summit, which we have ascended by a grade so gradual that one scarcely realizes that he is ascending, we have a grand and inspiring view of the great valley of Walker river, reaching nearly to the Sierra Nevada, the eastern border of this valley lying two thousand feet below, and seemingly almost under us, so abrupt is the western slope of the Mammoth mountains. Down among the foot-hills, along the east border of the valley, are located a great number of remarkably rich and large lodes of gold, silver and copper; but this region is so inaccessible and desolate that very little work has been done towards their development.

#### AN IRON MINE.

We are now standing almost over the mammoth iron lode of Nevada, which I had nearly forgotten to mention, so little are the inferior metals thought of in this section. This mine has been held by a company for several years. W. T. Jones, the principal owner, is an old iron worker, and is confident of its immense value and importance a few years hence, when the cañons of all these mountain ranges shall resound with the sound of the steam whistle and the clatter of thousands of stamps. This may be described as a mountain of iron ore, of eighty per cent. richness, and so abundant that the present generation could not exhaust the outcrop.

#### WATER SPOUTS.

This slope of the Mammoth mountains is subject to those terrible floods called water-spouts, caused by the bursting of rain clouds, that drift eastward during the summer months over this vast scorching plain from the Sierra Nevada. These clouds, coming in contact with this great barrier, with its cooler atmosphere, are instantaneously condensed, and the vast volume of water rushes down the mountain side in a body, gathering in its course till it gains, like a huge wave, a magnitude and velocity fearful to contemplate. Those who have witnessed mild occurrences of this kind, speak of the effect as being terrible beyond their power to describe. Nothing can resist their force; and this vast harrier, two thousand feet in height, is literally being eaten away by these fearful floods.

About one mile south, a fine grade has been made down the west side of this range, following the bed of a long winding cañon. This is on the Wellington road, leading from Austin to Aurora and California. From here we have a fine view of the road, winding out in the desert in the direction of Walker Lake, till lost to our sight. Twenty-eight miles due west we observe two conical peaks rising out of the sandy desert. Those two isolated mountains comprise Hot Springs District, lying too far west for our line of travel. It is a very interesting region, however. In one of these sugar-loaf peaks there is an astonishingly rich lode of gold-bearing quartz, the peculiarity of which is, that it runs nearly horizontally through the mountain, out-cropping two-thirds of the distance around. Northwest of this district are vast plains, covered with salt and soda in about equal parts, beautiful agates, cornelians, and even inferior opals are found here; also most beautiful silicified wood. Mammoth District, with its countless lodes and great variety of scenery, justly bears the palm in regard to timber and fuel.

#### LAST CHANCE DISTRICT

Is situated in the same range, five miles south of Mammoth District, and is abundantly supplied with wood, as are all other

districts in these mountains. Here the lodes occur in a fine textured granite near the summit, or I might say on both slopes; for here we are in the lowest pass of the range, which widens out considerably, forming numerous grassy parks, surrounded by symmetrical sugar-loaf hills, covered with the deep green foliage of the juniper and piñon. With the exception of the granite belt in which the lodes occur, the hills on the south side are formed of volcanic trachyte, while on the north they are of obsidian. The quartz lodes lie on the hill, gently sloping to the northeast. They are not numerous, but very large, cropping out boldly for a long distance. They were all located by one company from Mammoth, in June, 1865, since which time but little work has been done, owing to the following unfortunate circumstances: In September, 1865, Mr. James Dunn, of New York, who visited this section with General W. S. Rosecranz, purchased, on the recommendation of the latter, this entire property of the original owners, paying only in part down. On his way to New York, in the following October, he took passage at Sacramento, on the ill-fated steamer Chrysopolis, and was among the victims of that terrible explosion, being so badly injured that he died soon after leaving Aspinwall. Notwithstanding the property has been subject to re-location (by the local laws), the rights of his heirs have always been respected by the miners of this vicinity, and it is not a little strange that the balance of the purchase money is not paid and the property improved.

[To be Continued.]

[Written for the Mining and Scientific Press.]

### Mining at Virginia City and Austin.

AUSTIN, NEV., May 5th, 1867.

EDITORS PRESS:—In coming to this place, I stopped a short time at Virginia City, where a marked improvement in the state of things existing there for the past two or three years was visible; in fact, it is much to be questioned if the mining interest in that section was ever before in such a healthful and generally satisfactory condition as at present. The leading mines at that place are no doubt worked in the interest of the stock brokers just the same now as ever; but it has latterly become the case that a mine must have been brought to a productive condition and present good evidences of permanency and wealth, or at least a reasonable promise of such, before it can be made subservient to the purposes of this class—an absolutely worthless or unknown piece of mining ground no longer answering as a vehicle for speculative operations. Reduced to these conditions, the business of dealing in these mining stocks, though still sufficiently precarious, is less dangerous than formerly. Just now, nearly all the claims that can fairly be ranked among the producing mines on the Comstock lode are yielding moderately well—some of them very largely, though the quantity of ore being raised is not so great, nor of so high average grade, as was turned out several years ago. This does not result so much from any absolute deterioration in the quality of the ore as from the practice of assorting them less closely, a vast amount of lower grade being now worked that were formerly rejected. Thousands of tons taken from the dump piles of the mines first opened here, during the past year, been milled with profit. Portions of the lode passed by in the early days as being too poor to warrant removal, are also being stoped down and brought to the surface, the lessened price of labor and cost of reduction leaving a good margin for gain after defraying these expenses.

The collection and working of sulphurets, carried on about Virginia and Gold Hill on a very extensive scale, has also grown into a new and important branch of mining, adding another interesting feature to the economies effected in the business. These sulphurets, consisting of the particles of un-reduced ore escaping from the mass passed through the mills, is saved by means of sluices, the bottoms of which are lined with gunny sacks and blankets. There are miles of these sluices in operation on Gold and Six-Mile cañons, which, in the aggregate, collect immense quantities of sulphurets, or tailings, as they are more commonly

called, and which the owners dispose of to the mills, or have them worked on their own account. They yield by pan process from \$18 to \$25 per ton—the average being about \$20. The gross yield of these tailings for 1866 is estimated at \$72,000, and for the present year at \$164,000. Vast quantities are gathered, after the slum has passed all the sluices, in reservoirs, some of which cover acres of ground and will hold millions of tons, there being in several of them many thousand tons already collected. The contents of these larger receptacles are, of course, much poorer than what is gathered by the sluices, being worth but six or eight dollars per ton; yet the quantity saved is so large as to render the business of collecting them quite profitable. When we consider that the ores are now worked much more closely than formerly, and see how large a percentage of the metal is still lost, the fearful waste attending early operations becomes fully apparent. Some estimate that one-third of all the silver contained in the ore milled at Virginia during the first four or five years, was lost, making an aggregate of fifteen or twenty millions thus run to waste! This calculation is no doubt within the limits of actual loss, not more than seventy-five per cent. of the metal contained in the great mass of ores there being now saved.

The mills in this region (Austin) work much more closely—the chloride ores, treated without roasting, being worked within twenty per cent. of the pulp assay, and the sulphureted ores, which are roasted, within twelve or fifteen per cent. The cost of reducing the chlorides at the mill here is \$25 per ton—\$45 being charged for the sulphureted ores, as against about \$14 for the low and \$50 for ores treated by roasting in the vicinity of Virginia. But few ores are worked here that yield less than \$100 per ton, the average of that sent to the mills being about \$150. A great deal of that now being raised from the mines in this neighborhood will yield \$400 per ton. The average yield of the ore from the Comstock lode is now scarcely more than \$30 per ton, the value of claims on that ledge depending on the large body of ore they contain.

In another letter I will speak more fully of the mines and their product, the mills, etc., in this region.

H. DEGROOT.

### Telegraphic Communication with Mines.

FORESTOWN, May 15, 1867.

EDITORS PRESS:—The loss of the current in the late attempt to establish telegraphic communication with the underground workings at the Pewabic mine, Lake Superior, is probably due to the difference in the electrical tension between the surface and interior of our globe. Without at this time attempting to show why it is so, I shall premise that the surface of the earth is a vast reservoir of free electricity, and that, in telegraphing, the current is affected by displacement. In ordinary telegraphing a single wire is used, and the earth is depended upon to return the current. When there is a difference in the electrical tension between the termini it renders communication difficult, and when the distance is great, and the atmospheric conditions are such as to greatly disturb the electrical equilibrium, it may, during such disturbance, be entirely suspended. In a spherical body, the distribution of free electricity is entirely superficial—each portion is electrified alike. Now the loss of current in thirty feet depth, would seem to indicate that the free electricity of our globe is similarly distributed with that upon the smaller globes used in experiments. In order to avoid or overcome the difference in electrical tension, between the surface and the underground workings of the mine, I would recommend that the circuit be completed with wire. If it fails to work at either or both ends of the line, ascertain the depth at which it will work. Then increase the power of the battery by adding plates or cups until it will work to the required depth, and report progress, with particulars, to the MINING AND SCIENTIFIC PRESS.

F. A. H.

VALUE OF SILVER AND SILVER ORE.—An ore that contains one per cent. of silver, yields at the rate of \$396.97 per ton, mint value. One ton of silver is worth \$39,697. The United States mint pays \$1.22½ per ounce troy, for silver of 900 fineness.

[Written for the Mining and Scientific Press.]

### Revolving Calciners.

NEW YORK CITY, March 25, 1867.

EDITORS PRESS:—I am happy to see that one of your correspondents is about to introduce a more simple and efficient mode of desulphurizing. As the general run of mining men may not be acquainted with the principle advocated, allow me to say, that its efficiency depends on the regularity of the particles of crushed ore falling steadily and evenly over the rakes or scrapers, placed diagonally across the furnace, allowing the heated air to impinge against them. The bed, which is made of iron and covered with fire-brick or tile, revolves slowly; the actuating gear being placed beneath, and thus away from the action of the fire. The scrapers are fixtures and made of cast iron, supported by a cone in the center at one end, and in the walls of the oven on the other, beveled to an angle of 40°. The crown of the arch is about sixteen inches high in the center, diminishing to eight inches at the sides, and from twelve to sixteen feet in diameter. The ore is fed by a hopper, regulated by a valve; the feed being just sufficient to allow a perfect desulphurization by the time it works off toward the edge of the oven, where it is thrown into a receptacle to receive it. The fire-place is on one side, and the chimney on the other. The whole is perfectly self-acting. On a mine where there is sufficient ore produced, the cheapest way is to have only one central chimney, four ovens being arranged around it. Those commonly in use are built within retaining walls, admitting of a dripping floor being constructed over the ovens. The ore coming wet from the dressing-floors, is spread out on this oven floor, where it becomes perfectly dry before being put into the hopper. One man can readily superintend four ovens, which ought to burn from forty to sixty tons per day. They have been in use for the past six or seven years in Cornwall, among the tin mines. Those in work at Wheal Vor, Cook's Kitchen and Dolcoath, are considered good patterns. Since they have come into use, nearly all the old ovens have been thrown out, as one revolving oven will do the work of six of the others. They cost but little, and do their work perfectly. In connection with this improvement, I advise the introduction of Carpenter's Patent Jigg—it costs about \$700. The ore, as it comes from the stamps or crusher, passes into a receiving hopper, from whence it is distributed into four sieves. These sieves are fitted into a cast iron plate over a covered cistern. Through this plate a plunger works, throwing the water up against the bottom of the sieves, keeping the ore in a constant state of agitation, the heaviest particles of which fall down by their excess of gravity, through the sieve into the cistern below, while the skimmings are thrown off the surface in the usual manner. One man and a boy will work over thirty tons of ore per day. It is not a new invention, for it has been in use many years at Frowey consols, and other mines in Cornwall; but the improvements in the regulating gear, and some other modifications, admit the present machine to be patentable. There are several at work on lead mines in the State of New York, and Capt. Dennis, of the Erie mine, Orange county, informs me he can warrant one machine to dress, perfectly clean, the ore as fast as it comes from the crushers. Now this is a very great saving of time and expense, and from what I know of the old machines in England, and what my fellow miners tell me here of the improved jigg, I think it ought to be universally introduced; but more especially where labor is expensive. Our firm is about erecting one on a mine in Virginia, for dressing sulphurets direct from the strakes, the result of which I will communicate *pro et con*. We have also at our office, just sent from London, a sketch and description of "Hunt's Patent Jigg." This is also on the plunger principle. It is said to be perfect in its action, and far superior to anything else in England. We are making drawings of the "Carpenter Jigg" for several mining companies, and will do the same for any of our Colorado or California friends who would like to order them. The patent right is only \$250, and the machine is so simple that it can be made by any ordinary mine carpenter. Now, if it will dress sulphurets as fast and as clean as it does lead or copper ore, the entire cost of crushing and dressing need not exceed \$1.25 per ton, power included.

CHARLES S. RICHARDSON.

## Mechanical.

**STEEL-HEADED RAILS.**—Mr. S. L. Potter, of the Wyandotte (Penn.) Rolling Mills, has produced a steel-headed or "plated" rail, which, it is thought, will prove superior to a rail made entirely of steel. This rail is produced by a peculiar mode of piling, which consists in so placing in the furnace a rail pile, surmounted by a bar of Bessemer steel, that the true welding heat of both iron and steel is reached at the same time by causing the steel to receive its heat through the iron. These rails cost but forty per cent. more than the ordinary iron rail, while steel rails cost fully double those of iron. This compound rail has been subjected to a series of crucial experiments, which, it is said, have proven it to be much stronger than the steel rail. Should the anticipations of the inventor be realized, the "steel-headed rails" will prove a most important invention.

**ORIGIN OF TUBULAR BOILERS.**—It is believed that the earliest effort at producing a boiler with tubes for the purpose of exposing a greater surface to the action of the fire, was made by an American named Barlow, in the year 1793. The record of the invention is found in the French patent office under date of August 24th of that year, with an illustration. Zera Colburn, however, traces the origin of the idea to Neville, of London, in 1824. A copy of the record and illustration from the French patent office is given in the American Artisan, of Sept 6, 1865, from which it will appear that Barlow, the American, had given a big hint anyhow; whether Neville knew it or not. This important improvement has been variously ascribed to Seguin, Stevenson, Booth and Neville. They all did something toward it at an early day; but there is good reason for suspecting that they all got more or less of their inspiration from the American mechanic, Barlow.

**HARDENING BURNT CLAY.**—At Rivières, in France, they make tiles and bricks of a kind of sand clay, which contains 32 per cent. of chalk. When first burnt, they are so tender that, unless they are carefully handled, they fall to pieces. As soon however, as they are cold enough to touch, they are quickly removed from the furnace, and stacked. They are then soured with water, by the action of which they are so hardened that they may be used the next day for building. The fact is, perhaps, easily capable of chemical explanation, and brick-makers may be able to gather a hint from it.

**THE UTILITY OF WATER ON A FORGE FIRE.** It is a common practice of blacksmiths to occasionally sprinkle water upon their forge fires for the purpose of checking the blaze; thus rendering it more agreeable to adjust the iron properly in the fire while heating. It has recently been discovered that a protracted application of the water in the form of a mist, or fine sprinkle, accomplishes this object more thoroughly, and is attended with a great saving of time and fuel. By this action the heat is confined within the mass of coal, but very little being lost by radiation.

**AN ELASTIC GLUE.**—Take a quantity of good carpenter's glue, pour cold water over it and let stand until it becomes a gelatinous mass; then put it into a warm water bath until it becomes dissolved. Now add as much glycerine as there was glue in the first place, then mix and stir up well, and continue to beat it until the water has become evaporated. The cooled substance will be an elastic glue, suitable for a variety of purposes, such as stamping, etc.

**THE THERMOMETER** was invented in Holland, about the year 1609. The merit of its construction is not ascribed to any particular individual, but is distributed among many, as it was gradually brought to perfection.

**GLASS COVERING FOR WOODEN FLOORS.** A German chemist recommends soluble glass (silicate of soda) as a coating for floors. Before applying the coating, the floor should be well cleansed, and the spaces between the boards be filled with a mixture of silicate and chalk, or gypsum made into a thick dough, which quickly sets into a hard mass. The floor may then be brushed over with the soluble glass. If colors are employed, most vegetable pigments must be avoided, because of the alkali in the solution. The mineral colors used should be ground with equal parts of water and skimmed milk before they are mixed with the soluble glass. It is applied with a stiff brush, and as it dries quickly, a second coating may be put on in half an hour. It is said a brilliant polish is secured by finishing with a coating of oil. This process protects the wood and renders it almost fire-proof, and when colors are used is highly ornamental. It is reported to be well adapted for stores, offices and public buildings.

**REMOVAL OF FIRE-DAMP FROM MINES.**—A Mr. Williams, from Blairfin, Wales, has been illustrating, at Barnsley gas works, a scheme, by which he states coal mines may be cleared of fire-damp. The desired result is proposed to be obtained by the use of an apparatus consisting of an inverted syphon, to which is connected a pipe from the mouth of the shaft. The short end of the syphon is inserted in the place containing inflammable gas, and the pipe from the top is attached to the other end. The air first being extracted from the pipe, the gas, which is lighter than the atmosphere, will rise to the top. The experiments were, it is said, successful, and witnessed by several mining engineers.—*Builder*.

**TO GALVANIZE IRON.**—A good way to galvanize cast iron articles, such as gears and other small parts of machinery, is given in the *Scientific American*. Heat the castings to a red heat, plunge them into a clear muriatic acid, to detach the scales and thoroughly clean them, and then immerse in a bath of melted zinc. As soon as the iron has attained the melting heat of the zinc, it is removed. Great care should be taken, or in plunging the iron into the zinc while wet, the zinc will be thrown in the face of the operator. The zinc should be covered with sand, and the castings must be immersed very slowly.

**PRECAUTIONS IN USING ZINC.**—A report of a committee appointed by the Central Society of Architects, in Paris, recommends "that zinc, which was at first rejected, but is now so generally used, should be applied with great care, as certain precautions, very simple, but never to be overlooked, are indispensable. Thus, contact with plaster, which contains a destructive salt, is to be avoided; also, contact with iron, which is very injurious, and liable to cause a rapid oxidation. Eave-gutters should always be supported by galvanized brackets, and no gutter or sheet zinc should be laid on oak boards."

**DABOLL'S FOG TRUMPET** is now being introduced into Europe. Three of these machines have recently been put up by order of the English Government—one on the English coast, one on the coast of Scotland, and one near Halifax, Nova Scotia. Daboll is a genuine American inventor, and his useful device, so important to the interests of navigation, is eliciting high encomiums, both in Europe and America.

**THE INVENTOR OF THE RIFLE** is not known. The principle upon which the rifle ball is projected was known to the North American Indians when this continent was discovered. Their arrows were feathered spirally, and sped to their mark in the same manner as a rifle ball.

**A MAMMOTH LATHE.**—There is a lathe in Forrester & Co's foundry, at Liverpool, England, which has a face plate twenty feet in diameter and a slide rest twenty-five feet in length. The weight of this machine is seventy tons, and it is capable of boring a cylinder ten feet in diameter.

**THE TONGUING AND GROOVING MACHINE** was invented by Sir John Rennie, an Englishman, in 1814. He used revolving cutters. He was also the inventor of the first machine for planing iron.

**THE PRINCIPLE OF THE STEREOSCOPE** was well known to Euclid, who lived B. C. 300. It was also distinctly described by Galen, the famous Greek physician.

## Scientific Miscellany.

## Wilde's Electric Light.

We learn from the English journals that Mr. Wilde is still engaged on his magnificent electro-magnetic light. His machine has been a great source of attraction to the enrons and scientific during the past winter. The previous ideas of the value of this wonderful discovery have in no wise abated by his recent and continuous exhibitions; and the possibility of turning the discovery of this new mode of the development of electricity to practical purposes, is more than ever confirmed. The chief value of Mr. Wilde's discovery consists in its completeness and power, which places it far in advance of the conceptions of any of his predecessors in that field of research. His machine is a compound one—a magneto-electric apparatus and an electric-magnetic one. The latter consists of a very large electro-magnet, which is charged by the former; the armature therefor revolving within the magnet cylinder, and abstracting twice in each revolution, the fullest quantity of power deducible therefrom. This electrical force, so gained, can be made to evolve light, heat or dynamical power, according to the construction of the armature.

When used for illumination, the light is given off from carbon points, half an inch in diameter, and generated from the electrical currents direct, without the intervening action of any commutator. The currents are therefore intermittent, or constantly being reversed, which, when the revolutions of the armature are slow, have a flashing appearance, clearly perceptible to the eye; but when driven at a high velocity—say 2,000 rotations of the armature—the flashings, numbering 4,000, are entirely imperceptible, and appear one continuous blaze of the most intense brilliancy. The first application of the invention will be to light-house purposes; but it is the intention of Mr. Wilde to immediately institute experiments with the view of giving his invention a wider range of usefulness—applying it probably to metallurgical purposes, and as a motive power. We shall watch its development with no little interest, and shall not fail to note any progress which may be made.

**WATER BAROMETER.**—A mammoth water barometer was constructed by Prof. Daniel, of London, some thirty years ago, whose tube (of glass) was thirty-four feet long. It was constructed for more accurate observations than could be made with a mercury barometer. A water barometer is superior to a mercury one for observing the changes of pressure in the atmosphere, from the fact that when a variation of one inch only takes place in a column of mercury, the same change in the atmosphere would be indicated by a movement of more than a foot in a column of water. Hence, slight changes would be readily indicated by a water barometer which could never be noticed at all with a column of mercury. It is said to have been a most interesting sight to witness the operations of this barometric column of water in a quiet apartment during the prevalence of a gale of wind outside. In the inside of the large glass tube, the water on such occasions would, at times, tremble, and then move rapidly up and down, as if animated by some spiritual influence. These movements were the records of the unseen, but not unfelt, waves of the aerial ocean which surround our globe, and which are tossed to and fro by the unequal distribution of the solar rays.

**SINGULAR REGENERATION.**—It is a singular fact, first announced by Spallanzani and since verified by M. Phillippeaux, that if any portion of a member of the salamander—a water lizard—be cut off, regeneration takes place. This, however, is only when a portion of the member is left upon the body. If the member be entirely removed, no regeneration occurs.

**CAUSE OF THE FOREST GROWTH OF MICHIGAN.**—It is well known that the State of Michigan contains the most magnificent and extensive forest growth to be found east of the Rocky Mountains. This forest growth is due to the kindly influence of the waters of the great lakes which surround it. The prevailing winds which reach the area of that State are so modified, softened and charged with moisture, that the average temperature of the region over which they pass, is considerably below that of other regions, in the same latitude, either east or west. For the same reason, the eastern shore of Lake Michigan is becoming celebrated for the abundance and profusion of its fruits, and the certainty of its crops. The Peninsula of Florida is for the same reasons noted above, covered with a dense and most valuable growth of timber, chief among which is the well known live oak.

**THE KINDLY INFLUENCE OF EVERGREENS.** The utility of evergreens is not altogether confined to their pleasing effect upon the eye. Their influence is such as often to keep flowers growing near them in bloom, long after those not thus protected, have been destroyed by the frost and rude winds of autumn. Evergreens should form a conspicuous part of the landscape of every farm in cold latitudes. Many of our western farmers are setting them out in large numbers, as protectors to gardens, homesteads and cattle. Evergreens should occupy a large space in gardens, lawns and farms subjected to the bleak winds in the vicinity of this city, and all along the Pacific slope of the coast range of mountains in this State. Experience has shown that there is no difficulty in making them grow, even in the most exposed situations of this peninsula.

**UTILIZING A CHEMICAL CURIOSITY.**—The property of supersaturation belonging to certain salts has long been known to chemists, but, we believe, has never yet been turned to any practical account. M. Jeanne has recently proposed to utilize this singular property by employing it as a means of separating one salt from another. Thus 100 grammes of water at 118° will dissolve 335 grammes of nitrate of potash, and the solution will crystallize either in a close or open vessel. Now, suppose a mixture of 300 grammes of alum and 335 grammes of nitrate of silver be dissolved together; the alum will remain in the liquid in a state of supersaturation and the nitrate of potash will crystallize alone, just as if it had been dissolved in pure water.

**GEOLOGICAL PROGRESS.**—Although the record of the stones is yet but imperfectly read, each new discovery adds vastly to our store of knowledge in this direction by supplying additional pages, the absence of some of which have hitherto been unsuspected, while that of others have long been felt and diligently sought after. The history of nations is written upon imperishable pages indeed, but with a fallible hand; but the teaching of the rocks, as recorded "by the slow-moving finger" of time, is a record as perfect as the work which comes from the hand of the Creator himself.

**ELECTRICITY THE CAUSE OF ANIMAL COLORS.**—M. Nicolas Wagner has recently brought before the Academy of Sciences experiments which seem to show that electric currents are the cause of the colors, at least of some animals. These experiments were made on a species of diurnal butterfly (*Vanessa urtica*). Electric currents changed the reds into orange, and the blacks into red; and the most feeble current, especially if from a constant battery, produced black spots, the shape of which had a relation to the current. He ascertained, by means of an extremely sensitive apparatus, that not only does electricity modify and even produce colors, but that those found in the butterfly are due to currents in the wings of the animal—the most energetic of which issues from the base of the wing, and follows the middle nervure till it reaches the outer edge.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

64,203.—IMPROVEMENT IN CALLIPERS.—Jas. H. Culver, San Francisco, Cal.:

What I claim is a pair of callipers, either for inside or outside measuring, constructed with the joint, C, and shoulders, h and c, substantially as and for the purpose set forth.

The nature of this invention is to provide an improvement in callipers by which the difficulties met with in obtaining the dimensions of anything, in which the callipers must be changed before they can be removed or overcome.

64,212.—IMPROVED FIRE LADDER.—George K. Foster, San Francisco, Cal.:

What I claim is, 1st, The segmental rocks, F, G, and pinions, T, T, operated by the gear, n, g, and hand wheel, c, substantially as described.

2d, I also claim in combination with the ladder, the swivel joint rings, r, r, on the ends of the fulcrum rods, to support and carry up the hose when the ladder is raised for use.

The nature of this invention is to provide a fire-ladder and hose carriage combined, constructed in such a manner as to be easily and rapidly transported from place to place, to be very compact, and the ladders at the same time to be capable of as great extension as may be necessary or as is compatible with the strength of the material. The mechanism by which this is done, was fully described in our issue of March 23d, 1867.

64,220.—IMPROVEMENT IN KILNS FOR DRYING AND CURING HOPS.—Wm. M. Hayne, Sacramento county, Cal.:

What I claim is a hop kiln, constructed with boxes, having the slides, F, F, or their equivalents, substantially as and for the purpose described.

This invention relates to a kiln for drying hops, so constructed that the labor and time usually required for such purposes will be greatly lessened, while the hops will be much more easily and thoroughly dried, and be in a finer condition for the market. The device by which this is done was fully described in our issue of Nov. 24th, 1866.

64,221.—IMPROVEMENT IN QUARTZ MILLS.—James Hitchens, Nevada City, Cal.:

I claim an ore pulverizer, consisting of the containing cylinder, A, and the supporting plate, B, constructed and operated substantially as and for the purpose described.

The object of this invention is to provide an improved ore pulverizer, by which ore that has been broken into small pieces, can be reduced to an impalpable powder, thereby greatly facilitating the process of amalgamating the precious metals which it may contain. This invention has been fully described in this paper.

63,979.—MACHINE FOR GRINDING AND AMALGAMATING ORES.—Phillip Hinkle, assignor to himself and Charles S. Clapp, San Francisco, Cal.:

I claim, 1st, The employment of the removable side dies, G, G, to form a perpendicular grinding surface on the sides of the tube or pan, substantially in the manner and for the purpose described.

2d, The employment of the perpendicular muller-hangers, E, E, loosely hung on the pins, C, C, carrying the removable mullers or grinding-plates, F, F, of the shape shown in the drawings, thrown and passed laterally by centrifugal force against the perpendicular grinding surface, G, G, when the arms, B, B, are revolved with the supporting lip, I, and bearing surface, D, upon the arms, B, B, by which arrangement the pressure is lightest at the feeding point and heaviest at the heel of the muller, and also the provision for loading the muller-hanger to counterbalance the loss of weight by wear of the face of the muller, F, substantially in the manner and for the purpose described.

3d, The shape and arrangement of the cover of the pan, U, so as to form a flattened funnel-shaped dish, with annular grooves, S, for mercury, and raised current breaking ring, W, on its upper surface, the collars or projecting flange, V, with the apertures, R, R, under it, by which the escape of the pulp is permitted, and its current directed so that it is returned to the center, and a continual circulation maintained.

RE-ISSUED.—2,566.—METHOD OF OPERATING RAILROAD PUMPS.—Sam'l Moss, assignee of Gilbert Cole, San Francisco, Cal. Patented Dec. 16, 1862:

I claim, 1st, Conducting by means of connecting-pipes the steam generated in the locomotive boiler to a stationary engine by the road side, to operate the same as for the purpose set forth.

2d, The combination of a stationary engine and pump, the connecting-pipes c, c, and a locomotive boiler, as and for the purpose described.

## RECENT INVENTIONS.

AN IMPROVEMENT IN ROCK DRILLS AND DRILL MANUFACTURE.—Christian Jurgens, of Weber creek, El Dorado county, has made application for a patent for an improved rock drill and devices for more readily making and more perfectly shaping them. The drill consists of three angular cutting bits, having an obtuse point, thus giving it three regular incline, faces and three corners. When the drill has become worn and dull from use, the inventor uses a die, by means of which the smith may more readily and perfectly restore the drill to its original shape. In forming the original drill, the inventor uses a swage block, into which the bar of metal, after being heated, is placed, horizontally, where it is hammered and turned until properly shaped to receive its cutting faces and points. This swage may also be advantageously used in repairing drills and in keeping the drill in proper shape as it is gradually worn up by use and the requirements of new cutting edges. By the use of these shaping tools, a drill may be more perfectly and readily shaped and sharpened than in the ordinary manner of hammering on an anvil. Mr. Jurgens says his drill has been worked for months, with abundant success, fully proving its superiority.

A CALIFORNIA SNOW PLOW.—J. L. Nova, of Placer County, has devised quite a novelty in the way of a snow plow for railroads. A sort of wide-mouthed scoop takes in the snow, which is passed up and along to the rear of the car, by means of an elevator. When in open ground, the snow is conveyed on either side, to a wide shoot and thence outside of the track. In deep cuts, when the receptacle is filled with snow, the train is backed out of the cut, and the snow readily disposed of. In case the plow encounters a bank extending partially across the track, the machine is so devised that the snow may be readily conveyed to the opposite side of the track. Huge knives, which may be extended from 25 to 30 ft. in length, are projected in front of the plow which serve to make the first cuts in getting through the impediments which may offer. The machine has been tested and fully answered the expectations of the inventor. A larger one is nearly completed, from which still better results are expected.

CORAL-LIGNIN.—This is the name given to a new artificial substance by the inventor. It is said various articles of the new manufacture will be shown in the Paris Exposition. The material is made by macerating potatoes, turnips and carrots in water containing about eight per cent. of sulphuric acid for twenty-four or thirty-six hours. The acid is then washed out by repeated applications of fresh water. This must be continued until the center of the vegetable will not redden litmus paper. When potatoes are used, it will be found that considerable disorganization has taken place; they are whiter and soft. They must then be wrapped in blotting paper and carefully laid under warm sand, or upon chalk or gypsum. When dry, the potatoes will be found to have shrunk to about one-half their original volume, and in external appearance they will exactly resemble meerschaum. By treating the macerated potatoes with caustic soda, the starch and cellular tissues are made to unite and form a substance resembling horn. Turnips may also be similarly treated, so as to resemble stag's horns. Thin slices may be used as veneers, and soaked in glycerine and water they become flexible as leather. Carrots thus treated resemble leather, and may be used for handles of knives, umbrellas and whips.

A MARINE NOVELTY.—Capt. Jno. Rowell, of Brooklyn, N. Y., is engaged in building a miniature vessel, 26 ft. long, which he proposes to propel without the use of steam or masts. He uses the wind, indeed, for his motive power; but instead of sails and masts he has erected a wind-mill on the deck, which is made to drive an ordinary propeller. The mill, which consists of four fans, is placed about seven feet above the deck, and the canvas covering the fans is so contrived that it can readily be reefed or furled by means of halyards from the deck. In case of a storm at sea, he can easily take in sail and leave his vessel to, with a drag. Capt. Rowell proposes to cross the Atlantic in his tiny and novel craft.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
May 25, 1867.

## CITY STOCKS.

City Stocks continue inactive, and the offerings since our last reference have been very meagre. Sales of San Francisco Gas stock were made at \$65.50 per share; State Telegraph Co. at \$32, and Spring Valley Water at \$67.50. A few shares of California Steam Nav. Co. sold at 72  $\frac{3}{4}$  ct., and thirty shares National Ins. Co. at \$70.50  $\frac{3}{4}$  share.

The receipts of the local insurance companies and the city railroads during the first four months of 1867, have been as follows, according to the returns made to the Internal Revenue Department:

INSURANCE COMPANIES.	April.	Previously this year.	Total.
Pacific Union.....	\$54,303	\$156,575	\$210,878
National.....	33,704	19,227	52,931
Pierman's Fund.....	13,941	41,478	55,419
Builders.....	12,125	25,531	37,656
California.....	11,371	29,630	41,001
Merchants' Mutual Marine.....	9,851	44,364	54,215
Occidental.....	7,814	17,076	24,890
Home Mutual.....	7,352	23,433	30,785
San Francisco.....	5,844	13,015	18,859
Totals.....	\$177,936	\$496,417	\$674,403

CITY RAILROADS.	April.	Previously this year.	Total.
Omnibus.....	\$20,898	\$57,774	\$78,602
North Beach and Mission.....	18,283	50,726	69,014
Central.....	11,777	31,553	43,340
Front St. N. and Ocean.....	6,393	14,928	21,321
Market Street.....	8,136	13,959	22,095
Totals.....	\$55,412	\$168,950	\$224,362

The above returns were made in currency, which ranged from 73  $\frac{1}{4}$  to 75 cents.

The Stock and Exchange Board have made arrangements to hold their meetings in their new rooms, in the Merchants' Exchange building, on California street, on the first of June. They will be the first organization to transact business in that magnificent structure.

## MINING SHARE MARKET.

The mining share market continues to be characterized by large transactions in the various claims at present on the list of the Board. Most shares have sold at an advance over our quotations of last week, and greater firmness prevails in this class of securities than for some time past.

SAVAGE—has been in the market to a limited extent at enhanced rates, it is held with great firmness, advancing from \$3,500 to \$3,700, and at the close \$3,750 was bid. The Superintendent's report states that 2,326 tons of ore were extracted during the week ending May 18th, the approximate value of which is given at \$96,596, or \$41.57 per ton. The ore worked during the previous week yielded \$42.22 per ton. This ore came from the following points—Upper stations, including sixth, 126 tons; seventh level, north mine, 1,184 tons; middle mine, 639 tons, and south mine, 377 tons. Recent explorations in the upper portion of this mine have developed a seam of ore above the old second level on the east side, which is reported to be some five ft. wide and of good quality. This ground has been worked over and around so often that it is impossible to tell how far it may extend. The drift run due west from the E street shaft, at a distance of 360 feet—which is about the center of the claim—developed a very important body of ore, and it is believed that when the eighth level is developed, it will be found to extend throughout the entire length of the claim. The shaft has been completed to a sufficient depth to open another station, which will be the ninth or fourth from the E street shaft. We must commend the very full reports this company receives every week from its manager at the mine, and take this opportunity to recommend a similar course to several other prominent claims on the list of the Board.

HALE & NORCROSS—has been offered at \$3,500 during the past week. The average yield of this company's ore up to the 19th inst., has been \$42.60 per ton, with a gradual improvement toward the close. From the 1st to the 19th inst., 2,167 tons of ore were delivered to the mills, 65 per cent. of which, being the amount obtained from the mills, shows a yield of \$92,300. Every portion of the mine is said to look well. On the 16th inst., the shaft had attained a

depth of 346 feet, and was timbered throughout.

YELLOW JACKET—has been in favor, with small sales at an advance, rising from \$1,725 to \$1,835, receding to \$1,800@1,775, then selling at \$1,800@1,785, and closing at \$1,770. From the 1st to the 13th inst., this company's mine produced 2,712 tons of ore, showing an assay value of \$37.00 per ton. During the same period the bullion returns amounted to \$66,311.36. At the close of April, this company had a cash balance of \$100,596 over all liabilities.

CROWN POINT—receded from \$1,725 to \$1,640, gradually advanced to \$1,750, and closed at \$1,750. In drifting south, on the east body of ore, on the 500 foot level, the developments are said to look better than they did two weeks ago. The west drift, on the same level, is now in 130 feet, running in hard blasting rock. On the 17th inst., the shaft had been sunk 24 feet towards the 600 foot station.

CHOLLAR POROSI—has been in considerable favor, improving from \$600 to \$645, declining to \$580, rallying to \$613, and closing at \$605. We are informed that in the south end of the Blue Wing level the ore has made a turn to the southwest, where the seam is said to be eight or nine feet wide, carrying good ore. The middle winze of the Santa Fe level, at the close of last week, had been sunk to a depth of about 90 feet; it is still in ore, but not of so good a quality as formerly. The ore sent to custom mills during the week ending May 18th, aggregated 3,355 tons. This company now employs 325 men at the mine. It is believed that the bullion receipts for the present will exceed those of last month.

GOULD & CURRY—advanced from \$575 to \$660, receded to \$600, dropped to \$525, and at the close was selling at \$580.

OPHIR—has been exceedingly active, nearly 600 feet having changed hands during the past week, opening at \$337.50, advancing to \$425, receding to \$350, rallying to \$380, falling to \$345 under heavy sales, and closing yesterday at \$395. On the tenth station drift south the ledge has been cut, which proved to be very narrow. The drift has been continued north about twenty feet, and it is said that several days ago a ledge five feet wide was developed. The "up-raise" has not yet been opened. In the north drift, same level, water and patches of quartz have been encountered.

IMPERIAL—is in better favor, gradually improving from \$192 to \$217.50, then selling at \$212.50, and at the close realizing \$192.50. The receipts of bullion during the first half of the current month amounted to \$25,488. The ore sent to the mills during the same period aggregated 2,412 tons, and a surplus of about 1,000 tons remains at the dump of the Alta mine. KENTUCK advanced from \$210 to \$350.

ALPHA—sold at \$400@405....BELCHER realized \$396@410, closing yesterday at \$415....EMPIRE declined from \$170 to \$165, advanced to \$172, and at the close \$170 was bid....GOLD HILL Q. M. & M. Co. sold at \$175@167.50.

CONFIDENCE—declined from \$67.50 to \$50, assessment of \$10 delinquent on 23d instant, and closed at \$55 bid. The 410-foot level has been opened north and south about sixty feet, and it is said that the ore is seven feet wide, showing an average assay value of from \$50 to \$110 per ton. This new development, it is thought, will produce enough ore for a five or six months' run....OVERMAN advanced from \$43 to \$80, and at the close sold at \$70....BULLION receded from \$40 to \$30, and closed at \$35.

DANEY—sold at \$25@27. Advices to the 11th inst. state that this company, in its old mine, at a depth of 150 feet, are taking out considerable ore, which, it is thought, will give a fair profit over mill expenses. The company's mill commenced running on this rock soon after the above date, and it is believed that the present supply is sufficient for a two months' run.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,703,957.

## Allen's Lung Balsam.

Remarkable cure of the daughter of Robert Lawrence, Esq.:

New York, Ky., June 1, 1867.—Gents:—I will give you a statement of the wonderful medicinal properties of ALLEN'S LUNG BALSAM. My daughter was attacked with a cold, which settled on her lungs. A severe cough was the consequence, which so harassed her that she became much reduced. She had great pains in her side and breast, attended with cold chills and night sweats. She raised more than a pint of matter a day. Finally her lungs became ulcerated; her hands and feet were cold and clammy as death. Her physician, having failed to give any permanent relief, said that he could not do anything more for her; that she must soon die. At this time I procured Allen's Lung Balsam, which caused her to raise large quantities of matter and phlegm. When this was expectorated, her appetite and strength gained rapidly, and her cough in a short time ceased; and now she is a most extraordinary trophy of the medicinal properties of Allen's Lung Balsam.

Respectfully yours,  
ROBERT LAWRENCE.  
Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.  
Sold by all Medicine dealers everywhere. 1814-1m

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Alpine Miner* of May 18th: The editor saw a specimen of ore from a lode in this county, and asserts that, from the quality and quantity now in sight, it is equal to the Comstock, adding: We are not at liberty to point out the mine; but that the ore vein is six ft. thick—the whole, milling rock—and that it is not of a character to admit of its being a continuation of the Tarshish.

The Schenectady Co. is working eight men on the Tarshish, the number to be increased as soon as the ore house is finished. The ledge is opened some 31 ft. from the east wall, and no sign of being through yet. From present appearances, the lode will be to us what the Comstock is to Washoe. After running a tunnel in 500 ft., a large body of ore was struck, from 3½ tons of which a bar was obtained ten inches long by four deep and four broad, weighs \$39.80 ozs. troy, is 16-1000 fine in gold and \$53 in silver, and contains of the former \$277.74, of the latter \$926.18, or a total value of \$1,203.82. Two small bars, valued at about \$20, were run from the melted mass besides, so the actual yield per ton was a little over \$350.

The workmen on the Riuggold & Goldfinch tunnel have struck water, and a body of quartz of the same character as that in the Tarshish.

The owners of the Diamond claim have, in the last 12 days, made .58 ft. of tunnel 5 by 7 ft., averaging 4 ft. 10 in. per day.

## Calaveras County.

From the *Chronicle* of May 18th: Mining in the vicinity of Mokelumne Hill is very brisk. Hadlock & Brown are busily engaged in taking out ore at the rate of \$20 per day to the man.

Adams & Mitchell are working near French Hill with good success. They are employing a number of hands. The claim is giving a good account of itself. Smith & Peek, who have been prospecting the gulch near the soda factory, recently struck gravel which prospects finely. Labor has been resumed on the numerous quartz ledges in this vicinity, and the present season will see a number of mills erected.

A piece of gold weighing \$11 was picked up by N. B. Jenks, at Cat Camp, a few days ago.

## El Dorado County.

From the *Mountain Democrat*, May 18th: The Williams Co., at Rattlesnake Bar, have struck it rich—have a second Hayward mine. The ledge is what is called a sulphuret vein. At the depth of 28 ft. the vein is 6½ ft. wide, and the ore averages \$96 a ton. Out of three tons of rock we get one ton of sulphurets, and the latter are remarkably rich. Parties who have examined the ledge state it is one of the best in the State.

We have a number of quartz ledges in our neighborhood that only need development to make them pay handsomely. The Epley Q. Co. have one of the best claims in the State. The vein is from 2 to 3 ft. wide at the depth of 65 ft. They crushed this week 30 tons of rock at the Harmon mill, and the return was \$1,523 free gold, and the sulphurets paid \$50 to the ton. It was not picked rock, but taken indiscriminately from the ledge.

## Humboldt County.

From the *Yreka Journal* we learn that there is some excitement along the Sacramento river road concerning a report of rich diggings having been discovered in the Pitt River Valley, by parties from Red Bluff and Shasta.

## Mariposa County.

From *Gazette*, May 18th: The proprietors of the Potts mine are preparing to erect a ten-stamp mill in Hunter's Valley, to supersede the old Floyd mill. The entire machinery is now being constructed in San Francisco, and will be of the first-class, comprising all the latest improvements in quartz crushing, amalgamating, etc.

## Nevada County.

From the *Grass Valley Union*, May 12th: The Union Jack mine has been turning out very well during the week.

From same of 15th: Robinson, Butterworth and other capitalists of San Francisco, who last year purchased extensive gravel diggings at Humburg, in Bloomfield township, design the present season to construct a ditch from either the South or Middle Yuba, to carry water to their mining ground. The ditch will be 20 miles in length. Robinson & Co. have secured a water right in both of the Yubas, from the ditch companies who have original right to the waters.

Same of 16th: The W. H. Hoopers mill is crushing rock for the Gold Hill mine. About 1,500 tons of quartz from this mine have been crushed the present year at this mill. Two batteries, of five stamps each, will be employed on ore from the Diamond mine, the balance of this month. For the 13 months ending Jan. 1st, 1867, the Gold Hill mill crushed 2,500 loads of custom rock, yielding \$70,000.

Same of 17th: A portion of the hoisting and pumping machinery for the La Crosse mine, in Rhode Island Ravine, near Grass Valley, has been delivered at the mine, and the balance will be delivered in a few days.

From the *Grass Valley National* of May 16th: More mining will be carried on this summer and fall, along the river above and below Washington, at Rocky Bar, Jefferson, Brandy Flat, and other places, than has been done in any season in the past five years.

Same of 20th: The Lady Franklin mill, at Boston Ravine, has been leased by Southern & Cracklin, for one year, and is now crushing at the rate of 25 tons of rock per day. Rock from the Day ledge, on Spring Hill, is being crushed. This mill will be entirely devoted to custom work.

From the *Gazette*, May 18th: R. C. Black cleaned up in his hydraulic claims, after a ten day's run, and took out \$2,600. The French Co. have completed the survey of their ditch from Cañon Creek to Humburg, and make the whole distance 36 miles.

Same of 21st: An ancient channel has been discovered at Rocky Bar. The claims have been located by Dillou and others.

J. S. Spring & Co. have commenced work on the Mary Etta ledge, near Omega. They are sinking an incline 200 ft. south of the old shaft. The ledge is five feet wide and the rock richer than that taken out of the shaft last year.

The quartz mill of Black & Young, near Eureka, is now running regularly; their ledge is 3½ ft. wide. The last crushing yielded \$15 per ton. The Enterprise has been opened 55 ft., rock exceedingly rich.

From the *Transcript*, May 18th: Sanford & Co. have located 25,000 ft. in the bed of Greenhorn Creek. They intend to work the tailings through a flume 24 ft. wide. Headcock and others have located a quartz ledge between Orleans and Moore's Flat. Rock yielded \$40 to \$50 per ton. Buck & Co. have located the extension.

Same of 27th: Three tons of rock from the Monadnock ledge, yielded \$72. Prospects of miners at Sailor Flat and Blue Tent are excellent at present. The Banner Co., after a week's run under four stamps at Stile's mill, cleaned up 270 ozs. amalgam. The Ural Co. from 150 tons of ore crushed, cleaned up \$3,500; nine tons of sulphurets, separated from the pulp, sold for \$90. They have a 4-ft. vein, with 100 ft. back.

EXCELSIOR.—The Golden Eagle Co. have struck a strata of ore, at a depth of 10 ft., that shows a large amount of free gold. The Gold Run Co. have taken out some very rich sulphurets. Several mills are in operation at Meadow Lake. The Mohawk & Montreal, California, Grant and others are taking out ore for crushing.

From the *Meadow Lake Sun*, May 18th: A piece of rock from the Golden Eagle Co.'s claim, nearly one-fourth pure gold is to be sent to Virginia City for exhibition. The Reduction have increased their capital stock to \$30,000, and have levied an assessment of \$2.50 per share. The Live Oak Co., Pine Tree ledge, have taken out some ore, which shows considerable free gold.

## Placer County.

From the *Placer Herald* of May 18th:—The Last Chance Co., owned by Lawler, Tyler & Co., struck it rich last week, almost as much so as the Green Emigrant. The owners believe they have a fortune. The Savage and Mexico Quartz Co's, who combined to sink a shaft on the division line, at the depth of 12 ft., struck a ledge 21-2 ft. thick.

From the *Auburn Stars and Stripes* of May 15th:—The Green Emigrant still yields in undiminished volume. There is a rumor that a discovery has been made near town, richer than the Green Emigrant.

From the *Dutch Flat Enquirer*, May 18th: The King Bros expected to start up their Cement Mill on the 18th, they have a large pile of cement, ready to crush.

## Plumas County.

From the *Plumas National*, of May 11th: Twenty tons of rock taken from the Kitts Ledge, near Greenville, lately yielded, when crushed, the sum of \$500.

A number of new claims have been located on Mill Creek, the past week.

Last week, the water-shaft in Sherman & Co.'s mill, at Argentine, broke, causing a delay of operations for three days. The mine is paying well.

The Mammoth ledge, Eureka Mills, has prospected immensely rich lately.

## Shasta County.

From the *Courier* of May 18th: Two men recently rocked out \$80 in two days in a gulch near Farrington's saw mill, on Brandy creek. There are many such spots in that neighborhood.

A vein of exceeding rich rock has been struck in the Chicago claim, at South Fork, 72 ft. below the surface.

The conditional purchasers of the Crystal mine, at South Fork, have relinquished the claim to the original owners. The rock prospects splendidly, and the lode has every appearance of permanency.

## Sierra County.

From the *Downieville Messenger* of May 18th: The Monumental Co., at Potosi, while running a tunnel, a short time since, had a cave from overhead, which proved to be on the lead. A few ear loads of the dirt paid \$176.

The Boot Jack Co., at Gibsonville, washed out \$1,000 in one day, using only 30 inches of water.

## Trinity County.

From the *Shasta Courier* of May 18th: Several rich mining claims have been located on the divide between the head of Dog Creek and Hall's Gulch. One man made \$6 per day during the last month, and packed his gravel a distance of half a mile in a flour sack to get water to pan it out.

## Yuba County.

From the *Sutter Banner* of May 18th: Last week, the Blue Guard claim, at Smartsville, cleaned up \$75,000 after a run of 30 days.

From the *North Californian* of May 20th: A piece of white quartz, very rich studded with gold, was shown us this morning by Mr. Dufficy. A ton of it would be worth about \$10,000; and we wanted to know where the lead is, but he thinks he's got a big thing, and keeps mum.

From the *Marysville Appeal* of May 19th: The quartz now taken from the Rattlesnake is still richer than that in the Pennsylvania claim. The ledge, so far, is only three feet thick.

A Frenchman from Grass Valley is now employed to save the sulphurets for the Jefferson and Pennsylvania companies. The companies are crushing good quartz.

## ARIZONA.

From the *Miner* of May 4th: The new Vulture mill is in active operation, crushing 18 tons a day; as yet all of the stamps have been worked but a part of the time. The engine is the best yet put up in the Territory. It was built by H. J. Booth & Co., of the Union Foundry, San Francisco, and is of 50-horse power. It has all the new improvements. The Vulture mine is 14 miles from the mill on the Hassayampa, one mile north of Wickenburg. The claim consists of 300 ft., the original discovery claim of Henry Wickenburg. There are two shafts each 90 ft. in, showing a large vein of pay rock. The quantity of surface rock is very great. Two thousand tons are now ready for the mill. Lager & Co., of Fort Yuma, have the contract for hauling at \$10 per ton; they carry 30 tons per day. The ore worked to this time shows few sulphurets, and has averaged \$50 per ton. The gold bars pass at the rate of \$17 per oz. A large amount of bullion, from the Moss lode, arrived in San Bernardino from Hardyville, en route to San Francisco.

## COLORADO.

From the *Times* of April 30th: The deepest shaft of the Gunnell lode is 512 ft. in. It is at present in one of its fitful humors, and does not yield its usual proportion of treasure. A gang of men are working the Empire lode; they are 35 ft. in. The lead is six inches wide. Some of the citizens are pitching into the I.X.L. on their own account. The shaft is 40 ft. deep, with a crevice of 15 in. solid iron. Messrs. Lyon & Co. are working on the Pewabic lode. They have an engine over the shaft and are getting out ore merrily. The shaft is about 90 ft. deep, and the crevice between seven and nine feet wide. It is filled with soft copper pyrites mixed with magnesia, and is worked almost as easily as if a dirt crevice. Messrs. Zeyner & Briggs are at work on the Kingston lode. It is opened out for 400 ft.

Two assays of the Franklin lode by Mains & Hutchinson, were as follows: One, per ton in silver, \$322.92; the other, per ton, in silver, \$388.18. Just below the Franklin is the Waterloo. The galena near it appears rich. Many tons have been smelted in Lyon & Co's furnace. It assayed per ton, gold, \$198.42; silver, \$4.13.

The Ayres lode has developed a seam eight inches wide. The superintendent feels sure of soon striking the main crevice several feet wide. The tunnel is in 126 ft., and is 130 ft. higher up the mountain than the Ayres. The elevation at this point is 112 ft. The mammoth smelting works of the Con-

solidated Gregory Co's, late J. E. Lyons & Co's, are again at work.

On Clear Creek, the miners are doing well. Capt. Dean, from six buckets of dirt, washed out three-quarters of an ounce of coarse gold. The Grass Valley Gold Mining Co. will soon commence work on Montgomery Bar.

Some Frenchmen below Idaho are making four to six pennyweights per day to the man. The ground was worked over once or twice before, in '61 and '62.

Prof. Schirmer's assay of the matt from Grey's furnace in James Creek Dist., yielded \$405.36 per ton. No copper assay has been made. The Prof. thinks that the matt from the Pitman lode will yield 60 per cent. copper. Three hundred and twelve feet on the Illinois lode, with the 12-stamp mill and appurtenances, in Illinois Central Dist., Gilpin county, was sold to the North Star Gold and Silver Mining Co. by H. C. Bullard, for \$40,000. Henry Briggs sold sundry claims in Gilpin county, to the Birmingham Gold Mining Co., for \$12,000; also 200 ft. on the African lode, Quartz Valley Dist., for \$9,000. Messrs. R. H. Berryman, J. F. Spaulding, S. V. T. Thompson, and N. H. Warren sold 700 ft. on the Oro Cache lode, Phoenix Dist., to H. K. Horton and others of Mass. and N. H. for \$25,000.

From the *Register*, April 28th: A silver bar was on exhibition at the Rocky Mountain National Bank. Its weight was 62.15 ozs., and is valued, in coin, at \$85.30. It was taken from 1,200 lbs. of Baker ore, by Messrs. Reese & Co's process.

Judge Morse has sunk his shaft on the Pendleton lode 130 ft.

Mr. Babb has begun work on the Raymond lode, in the old Martin shaft, which has been deserted since 1862. The shaft is 160 ft. deep. The work is being done in a drift near the surface. The vein is narrow, but very rich. The Quartz Hill tunnel is 233 ft. in length.

## IDAHO.

From the *Owyhee Avalanche* of May 4th: The snow is becoming rotten in Owyhee and will soon be gone. Two companies, organized in Iowa, have their agents on the ground in Flint Dist. The Forrest lode is represented immensely rich in silver. An 80-ft. shaft has been sunk on the Silver Cord lead, and the vein will soon be in good working condition. The work of taking out and milling ore from the New York lead has already commenced. The Hays & Ray tunnel is now extended 600 ft., and will reach the Poorman about the first of June, and the mine will be in condition by that time to supply 100 stamps with ore for crushing. The Rising Star, in Flint Dist., is yielding richer ore than ever. The Oro Fino mine will soon be in condition for working again.

Beachy's stage line regularly brings full loads of passengers to the northern mines. The destination of most of them is Lemhi. The War Eagle mines are undoubtedly rich. Great reduction has been made in the price of freighting ores from the mines to the mills, from \$6 of last year to \$3 of this year. The Chinamen are doing an active business in the placers of Owyhee. There is a prospect of again working the Allison lead. A prospecting party have gone into the Goose Creek mountains.

From the *World* of May 4th: After a two weeks' run at the quartz mill of the Elk Horn Co., the product from 100 tons of ore was 607 ozs.; the assay yielded \$8,300. There are 600 tons more of the same quality ready to crush. The mine is six miles from Pioneer City, and is the best quartz mine in Boise county. The mill is driven by water supplied by a ditch owned by the company, and runs five stamps. The main tunnel in the Elk Horn vein is 400 ft. deep, and the ledge averages two ft. The ledge was struck 104 ft. below the upper tunnel last fall, and another tunnel 380 ft. deep has been pierced which develops a continuous vein of three ft. width, in which blue sulphurets abound.

A miners' meeting at Centreville, April 25th, resolved that all ground vacated or worked out shall be a dump, without redress for damages, and that no miner or miners shall be prohibited from dumping on said ground, and in case of dispute to be settled by action of the miners.

From the *Lewiston Journal* of May 3d: Snow in Warren's Basin is about two feet deep. A few miners had commenced washing; D. Moore & Co. were about to commence. Bill George had been working for about two weeks. The Irish Co. just below town were all ready to commence. Several companies had been drifting all winter. B. Haymond & Co's tunnel had been completed. Sanderson & Bemis were to commence work this week.

Good diggings had been found six miles below Faust's ranch on South Salmon. Mining had been conducted with good success on south fork, about 30 miles above

Fausts', all winter. Some new and rich discoveries of quartz, both gold and silver, had been made on the east side of the south fork. It is claimed to be as rich as the float rock found near the W. P. Hunt lead.

Work had been resumed on the tunnel of the Liddle & Harper at Florence, and the vein of ore was near at hand. The French creek ferry is in full blast.

#### MONTANA.

From the *Helena Gazette*, May 4th: The Black Prince, Harrah, Cannon, Sioux Chief, W. A. Allen and Swansea silver leads, located last fall and winter in Ten Mile Dist. are all No. 1 leads. The Henry Allen, a gold ledge, has a width of 38 ft. Any piece of gold taken from the ledge will prospect handsomely. Assay of the Black Prince yielded traces of gold, and \$92 silver per ton, while the Cannon showed, gold \$28, silver, \$66 per ton. None of the leads are sunk on more than 10 ft. Col. Allen and Billy Foster, old Colorado miners, were the discoverers. The Spanish lode has been prospected 25 ft. with a 4-ft. crevice. Amazon, 35 ft., with 10-ft. crevice; Paul Jones, 40 ft., 4-ft. crevice. The ore from these lodes contains abundance of metal.

The Copperopolis, J. J. Newland, and Desoto lodes, Muschell Dist., are represented by a quality of ore that approximates pure copper. The Newland is a lead recently discovered. In the furnace this ore melts down like lead ore, the slag being almost entirely consumed by a very low furnace temperature. The shaft on the level is down 35 ft. with a width of crevice of 2½ ft. From present indications this is likely to prove one of the best lodes in the district.

Five well defined lodes of great extent and richness, have been developed. The Muschell copper mines are on one of the main Indian trails to the Gallatin.

The mining ground at Lincoln Gulch is 12 miles northwest of McClellan, about eight miles long, and follows to the Big Blackfoot river. It was discovered last September, about one-third of the way up the gulch. The bedrock is a quartz ledge. Several claims were successfully worked last fall and winter. The pay streak is about 140 ft. wide and four or five feet thick, and on some claims pays from \$1 to \$10 to the ton. Above the discovery the streak is narrower than below, but the gold is coarser. Claim No. 8 yielded last fall, in a few weeks, \$18,000. It has been let out on shares. A rich bar has been discovered in the vicinity and shares are as high as \$2,800. On claims Nos. 12 and 13 the pay streak seem to be divided. The gulch has been prospected to No. 36 below discovery, and is considered very rich generally.

A contract has been let by the Water Ditch Co., to run a flume across Last Chance Gulch, by which water will be supplied to Dry Gulch and others east of Helena—contract to be finished in less than a month.

From the *Helena Herald*: Gold placers have been discovered on Vermillion Creek, about half way between lakes Flathead and Pend Oreille. A silver lutton weighing 120 lbs., valued at \$1,956, was taken from the Argenta mine. It is circular in form, about 30 in. in diameter and 1½ in. thick, was the product of 7½ tons of ore, cupelled in 25 hours. The ore from the Oro Cache yields \$100 per ton. On the Black lode two shafts have been sunk 50 and 75 ft. respectively, showing a vein of seven feet of pure quartz, yielding \$360 per ton, gold. Sufficient work has been done on the Wayne & Upania lode to demonstrate their permanence and richness in silver ore.

Weekly, large cakes of silver are transmitted to the banking house of Nolan & Weary, from the Essler silver mines. The last lutton weighed 180 lbs.

#### NEVADA.

From the *Enterprise*, May 16th: A bar of gold extracted from Midas ore at the Wheeler mill, weighed 21.92 ozs.; value, \$411.72. The gold is .917 fine, or worth \$18.96 per oz. The Pioneer mill is crushing ore from the Wilson lead. The Penrod is crushing ore from the Midas, and the Wheeler astrata mill is crushing ore from the Sentinel. The Wilson lower tunnel is in 420 ft. Nearly every piece of rock taken out, shows free gold, and their dump presents the appearance of a huge pile of specimens. The Wheelers are hoisting rich ore from their old shaft. The Imperial Co. struck their ledge in a shaft 50 ft. from the surface, and have drifted 12 ft. without getting through.

The Reese River and Hamilton claims, are promising well. A cut across the Vanderbilt ledge, seven feet deep, shows it to be by actual measurement, 47 ft. in width. A shaft has been sunk 50 ft., and at that depth, the ore assays, silver, \$27, gold, \$7 per ton. Work will begin on the Bina and Congress ledges as soon as the necessary machinery arrives.

The Bewley is one of the most promising claims in the district. An incline 6x10 is being sunk; it is now down about 60 ft. The claim has produced 400 tons of ore, which is now at the dump. Some parties at Gold Hill have made arrangements to open and develop the New York ledge.

#### MINNESOTA.

From the *Register* of May 11th: The Golconda is a better mine than heretofore reported. There are thousands of tons of ore in sight. The last 14 tons worked at Holt's mill, yielded \$1,300. Work on the mine is now suspended, from the fact that four hands can take out ore enough to keep several mills running. Three men in two days took out of the Cumberland lead 20 tons of ore. If this mine will yield \$30 or \$40 per ton, it is a handsome thing. The Rochester Co. expect to begin work in a couple of weeks.

#### MINNESOTA.

From the *Territorial Enterprise*, May 18th: The principal claim worked at present is the Illinois on Silver Mountain, located nearly in the center of the district. It is being opened by a shaft and four tunnels. The outcrops of this lode are very prominent, rising on the west of Silver Mountain 15 ft. above the ground and 25 ft. wide. One tunnel will tap the lead about 75 ft. below the croppings; another will strike the lead 100 ft. below; the third about 300 ft. below; a fourth tunnel is started still lower down on the north side. The shaft shows good mineral 10 ft. wide.

The superintendent of the Sand Springs salt mine, expects to sell \$100,000 worth of salt this year—which will be an improvement of 25 per cent. on last year's sales.

#### MISSOURI.

From the *Silver Bend Reporter* of May 11th: All of the bullion shipped from Silver Bend is at present produced by the mill of the Belmont Co. from ore taken from the Transylvania ledge. Work is continued upon the Highbridge ledge, but no ore has been reduced for the past month.

The shaft on the Highbridge is now down 125 ft., and indications are that it is close upon the lode. Three hundred and thirty tons of ore were reduced, which produced \$17,000.

Upon the Transylvania, an incline is now down 55 ft. below where the ore that is milled is taken. In this incline the lode preserves its uniformity and evenness, pitching at an angle of about 75 degrees, and maintaining a width of about eight ft. The mill has netted from the Transylvania ore, during the month of April, a clear profit of at least \$5,000.

The Belmont Co. are sinking an incline upon the El Dorado, which is down 65 ft., with flattering prospects.

Work will shortly be resumed upon the McDonald claim, in Ophir Cañon. The McDonald Co. own the first southern extension of the Murphy ledge, and already have a shaft sunk to a considerable depth upon it, but a few yards distant from the opening upon the original Murphy mine.

A vein of exceedingly rich ore was discovered, a few days since, by A. W. Simonson, northwest of the Arizona and within a short distance of that mine. Specimens from it show a plentiful amount of horn silver. A shaft has been commenced that is now down about four ft. The width of the vein is about 14 inches. It has been stripped along the surface for about 300 ft., and found to maintain a uniformity of width throughout, while the ore is of equal richness.

The Rutland mill is still idle. Large lots of ore from the claims of the Bullion, Davis and Emersley Co's are now on the way to Austin for reduction. Work is progressing upon the Indian Jim, Gazelle, Keystone, Alta and Clipper ledges. The shaft upon the Indian Jim is still continued, and there has been considerable ore taken from it that is estimated will work \$800 per ton. Upon the Keystone and Gazelle there are 14 men employed. A tunnel has been run, which, at the distance of 40 ft., cuts the former lode at a considerable depth, striking a stratum of ore three ft. thick, 18 inches of which is of a high grade. The Gazelle has been worked by a cut now 80 ft. into the hill, a prominent and well defined vein disclosed of six ft., and the ore is of remarkable richness. Six tons have just been shipped to Austin for reduction, and there are 80 tons more lying upon the dumps of an estimated average of \$200 per ton.

The owners of the Alta have been at work now about ten days, and it promises well. The Clipper ledge has a shaft to the depth of 78 ft. At the surface, the lode is about 1½ ft. thick, but it gradually increases, and at the bottom of the shaft is 3½ ft. The ore is not of a high grade, being estimated to work from \$60 to \$100 per ton, though at the bottom of the shaft ore is procured as

saying much greater. The Chieftain and Niagara lodes have been worked to a slight extent, promising well. Preparations are now making to commence operations upon them. The mill at Hot Creek is still idle.

Work has been done on the J. K. Fisher, Tonton and Germania lodes, at Milk Springs, with the best results. The Empire, Danville, Hot Creek and Reveille lodes develop very rich ore on the surface. An excavation 20 ft. deep has been made on the Fisher, in which one of the walls was di-closed, and the same thing occurred in a similar cut between the Teuton and Germania.

From the *Reveille* of May 15th: Two and a half tons of ore from the Westfield ledge, in the Reveille Dist., yielded as follows: The first lot of 3,000 pounds at the rate of \$600, and the second lot of one ton at the rate of \$550 per ton. Both lots were worked at the Keystone mill.

The new stack for the furnaces of the Manhattan mill, which is being built by McGinnis & Cozzens, will be 64 ft. high, 8 ft. 4 in. at the base, and nearly 4 ft. at the top. The stack will be square, and, excepting the foundation, will be built of brick.

A certificate of assay by David Lundhom, of pulp from the Silver Chamber, was well up in the figures. The pulp of the first-class chloride ore, of which one ton was worked at the mill, was \$933.09; of the second-class, of which one ton was also worked, was \$157.08.

From the *Trepass* of May 15th: Since the last two weeks the machinery at the Confidence lead has been thoroughly overhauled and everything put in order for sinking the shaft to an additional depth of 275 feet, or a total depth of 850 ft., with levels opened at each 20 ft. While this work is progressing, ore from the old chambers to the amount of 50 tons per day will be taken out, which will mill \$30 per ton. The Co., since its organization, has extracted bullion to the value of \$750,000, yet the returns do not decrease.

But little work has been done in the Danville Dist. during the winter. There is a prospect of work being soon commenced. Work will be resumed on the Northumberland ledge soon.

Same of May 18th: Work is being vigorously prosecuted on the Highbridge, Combination and Transylvania Co's. All are engaged in sinking shafts and running tunnels. The Belmont Co. intend to increase the capacity of their mill to 24 stamps. The Combination Co. propose to erect a 40-stamp mill. It is expected to be in operation by Fall. The Pennsylvania Co. also propose putting up a 24-stamp mill, which will make 84 stamps upon ore from these three companies.

#### WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise*, May 16th: Copper smelting is about to be commenced in Peavine Dist. Two of Haskell's patent furnaces are on the way.

From the *Transcript*, May 17th: It is generally believed that the Savage mine will go up to old Gould & Curry figures—\$6,000 a foot. A dividend of \$200 per foot is confidently expected for the month of June.

From the *Trepass*, May 16th: Mr. Negus, of the American Basin Co., has let a contract for the continuation of the tunnel in that claim. He has just returned, from San Francisco, where he purchased a mill of 16 tons capacity, for the Golconda. All the mills in Storey, Ormsby, Lyon and Washoe counties are at work, with plenty of ore for many months to come.

From the *Gold Hill News* of May 15th: Water is increasing in the tunnel of the Cole mine. The tunnel is 1,700 ft. in length, and the work of drifting for the ledge is being vigorously prosecuted, with flattering indications of cutting a rich body of ore soon.

From the *Enterprise* of May 18th: The Crown Point Co. have just completed a fine dump provided with all the late improvements for loading teams. Their stone sewer eight feet in width and 200 in length, is finished, a road is being built over it.

Wells, Fargo & Co. shipped during the past week, 8,169 lbs. of bullion, valued at \$199,226.14; from their office in Gold Hill, 6,494 lbs., valued at \$133,953.23.

#### OREGON.

From the *Dalles Mountaineer*, April 28th: Considerable excitement exists at the Dalles and Cañon City, about the new diggings just discovered on the John Day and Crooked rivers.

From a private letter published in the *Times* of this city, we learn that the Yaquina coal mines are very extensive. There is at least 1,000 acres of coal deposit. Along Yaquina Creek, pieces of coal weighing over 100 lbs. are found. Facilities for conveying

this coal to the place of transportation are unusually great, the distance to navigable water is five miles, over a level plain or bottom. A railroad has been constructed at a small outlay, and coal placed alongside the vessel at a cost of \$2 per ton.

#### Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth.	\$ 1.75
ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other bituminous substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo.	3.00

Address, DEWEY & Co., Mining and Scientific Press Office, San Francisco. 1413-1415

THE NEW YORK AND BROOKLYN BRIDGE. The bridge projected to connect New York with Brooklyn is to be constructed under the direction of Mr. Roebling, the architect of the Niagara and Cincinnati suspension bridges. It will be twice as long and twice as wide as the latter, and will be sustained by an immense pier in the center. The architect proposes to make it the crowning engineering achievement of his life.

**American and Foreign Patents.**—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1866.  
**Mr. L. W. Felton**, is an authorized agent for this paper at Portland, Oregon, Dec. 1, 1866.  
**Mr. E. L. Smith**, is a duly authorized Agent for this paper, February 23, 1867.  
**Mr. J. M. Kennedy** is an authorized agent for this paper, in the counties of Santa Clara and Santa Cruz.

Saturday Morning, May 25, 1867.

## Notices to Correspondents.

FENTIAN is right. Chenevix was no more a Frenchman, notwithstanding his French name, than the numerous descendants of many existing Irish families who possess French patronymics, as instances of which may be given the names of Roche, Power (Le Poer), Burke (De Boreg), etc., etc. Chenevix was an Irish gentleman who happened to be in Paris during the Robespierian reign of terror, and was thrown into prison. This fact has perhaps tended further to confirm your Gallic opponent in the opinion that Chenevix was a Frenchman. This occurred at the time when the cry raged that "the nation did not need chemists and philosophers." Chenevix was placed in the same apartment with the illustrious Lavoisier and other talented chemists, who constantly kept amusing themselves by debating chemical topics. Chenevix thus became infected with a desire to learn the science, and immediately on being liberated, began to study chemistry with great energy, and soon distinguished himself as an analytic chemist. His analyses of corundum and sapphire, and his observations on the affinity between magnesia and silica, are very valuable, and led to considerable improvement in the method of analysis. In fact, Chenevix was for several years a most laborious and meritorious chemical experimenter. Unfortunately, owing to a mistake which he fell into respecting palladium, he entirely abandoned chemistry. The history of this error forms a curious episode in chemistry. It is, however, too lengthy for our columns this week.

CONRAD.—Blue rock salt is occasionally found chiefly, if not solely, in the Austrian provinces. It occurs of all shades, from that of a rich sapphire blue to the merest cerulean tint, in some cases graduating from the first to the latter until the color entirely disappears in the colorless crystal. We are not aware that any satisfactory explanation has ever been yet given for the phenomenon, and we certainly shall refrain from giving any theory of our own, seeing that it evaded the research of the celebrated Sir H. Davy, as will be gathered from the following extract from one of his letters: "I found a great deal of inflammable air in the great salt mine at Helstedt. The salt, like the quicksilver here, is in hituminous schist. The inflammable air is found in largest quantities where the blue salt is. I have again been searching in vain for the cause of this extraordinary color." Whilst writing the preceding, it has occurred to us as not being very improbable from the conditions accompanying rock salt, as above described, that the blue color may arise from the formation of some natural compounds of aniline.

**RAILROAD IN NEVADA.**—Incorporation papers were filed in the office of the Secretary of the State of Nevada, for the organization of a company to build a railroad from the Truckee, some five or six miles below Stone & Gates' Crossing to Virginia. Bolton, Barron & Co., and the Bank of California will furnish the capital. The road will be about 17 miles in length, and its estimated cost is \$750,000. The heaviest grade on the line will be 150 feet to the mile.

## Home Trades and Manufactures.

**CARPET BEATING MACHINERY.**—Messrs. J. Spaulding & Co., who, for the past year have been successfully engaged in cleaning carpets by machinery, have just completed a three-story building, forty by sixty feet, at No. 355 Tehama street, and provided the upper stories each with one of their carpet-beating machines and the necessary fixtures for conducting their business on a very extensive scale. As an evidence of this fact, about 8,000 yards of carpet from the Cosmopolitan Hotel has recently been hoisted by the machinery from the ground floor, in readiness to be put through the machine at the rate of about 500 yards at a run. From eight to sixteen breadths, fastened to canvas aprons, attached to rollers twenty feet in length, are wound and unwound, as occasion requires, and made to run the gauntlet of forty lashes per second from as many revolving rope whips, by which the carpets are cleaned from dust and grit without any damage to the fabric, and far more thoroughly and uniformly than by any of the manual operations hitherto employed for the purpose. The two machines in this establishment, together with the hoisting apparatus, are driven by a neat six-horse engine and hoiler of San Francisco manufacture, the former having been built by Geo. T. Pracy, Mission street, and the latter at the Neptune Iron Works. These works are said to be capable of cleaning 50,000 yards of carpet per month. The work is done at a cost of from five to ten cents per yard, the carpets being called for and delivered.

**HUNT'S WINDMILLS.**—Patented Aug. 19th, 1862.—These mills have continued to increase in favor. The self-regulating have nine sails, with a flange on the back of each, as a regulator, which holds back in proportion to the strength of the wind. A convenient brake is also attached to each mill, by which it can be stopped at any moment, and held at rest during the most violent storm.

The adjustable mills have twelve sails, which are turned edge to the wind when the brake is applied to stop the motion. By means of this same lever, placed at the foot of the mill, the sails are adjusted to any angle desired, so that the mill can be run with ease and perfect safety in any strength of wind, from the lightest breeze capable of imparting motion, to the heaviest gale.

A small illustration of these mills may be seen in our advertising department. Mr. Hunt is one of our most ingenious inventors, and has other patents yet to bring permanently before the public. For this reason, being of advanced age, he desires to interest some active parties in disposing of State and county rights. His shop, No. 28 Second street, is well worth a visit by those who take an interest in novel inventions.

**GOLDEN STATE POTTERY.**—We have had occasion, during the past week, to examine the large and varied assortment of earthenware at the depot of Messrs. Lobree & Co., 516 Commercial street, where we gleaned some facts as to the present status and future prospects of this comparatively new enterprise. The works of the Company are located at Antioch, Contra Costa county, in the vicinity of which an abundance of clay is found, not only for the different styles of earthenware to which they have hitherto given the most attention, but also of a kind suitable for every description of stoneware and the manufacture of fire-brick, some 20,000 of which article they are now using for the arches and lining of the new kiln they are erecting for burning their wares.

We understand that some of these bricks have been subjected to severe tests, which they have stood remarkably well. If they should prove, on a more thorough trial, to be equal to the imported article, as they are believed to be by the proprietors of these works, it will be a great acquisition to the coast, as they can be furnished at less than

one-third the cost of those from abroad.

In the manufacture of the stone and earthenwares, the clay is ground, washed and evaporated in shallow vats to the proper consistency to be shaped into the required form by the hands of the potter, aided by the necessary machinery, or pressed into molds of plaster of paris, as the case may be—the more beautiful designs for ornament being formed by the latter process—after which they are dried and burned in the furnace; the time and degree of heat varying according to the purpose for which the ware is intended.

Messrs. Newman & Brannan have ordered a ton of this clay for the San Francisco Glass Works, in order to give it a thorough test, the result of which will be of interest to smelters, foundrymen, and many others.

**CALIFORNIA TWEEDS.**—The woolen machinery, which we mentioned some time since as having been ordered by the Oakland Cotton Mills, has arrived, been put to running, and the cloth is now in the market for sale. The kind of cloth made is "tweed," similar to that of which tweed overcoats and ladies' cloaks are made—consisting of equal parts of wool and cotton. The cloth is fine and firm, and fully equal to the same class of goods imported from the East. It is said that it can be manufactured here cheaper than it can be imported. A new article of manufacture is thereby added to the rapidly increasing list of California-made goods. We are fast becoming independent of the Eastern market for everything, the raw material of which we can produce here.

**IMMENSE BOILERS.**—The largest boilers ever built on the Pacific coast have been turned out, the past week, from the shop of Coffey & Risdon. They have been built for the steamer Orizaba, and as the first was moved, in all its huge proportions, slowly through Front street, on Monday and Tuesday, it elicited universal commendation and surprise from the great crowds of spectators who witnessed the unusual spectacle. Coffey & Risdon have manufactured both of these huge boilers for the steamer mentioned. They weigh thirty tons each, are thirty feet long, each boiler having three furnaces twelve feet long, forty inches wide and four feet high. There are also twenty-two flues in each boiler fourteen and a half inches in diameter. The steam chimneys to each boiler are twelve feet high and eight feet in diameter, thoroughly braced. It is gratifying to know that the foundries, machine, forge and hoiler shops of San Francisco are now able to turn out about every piece of machinery that enters into the composition of even our largest ocean steamers. We trust the time will soon come when we need no longer go to New York for either the hulls or machinery of any steamer which carries the American flag over the waters of the Pacific Ocean.

The second boiler, and mate to the above, is now on its way from the shop to the steamer. It is moved on rollers, with a horse and whim, in the same manner as houses are moved from one part of the city to another. These boilers are not only the largest ever built on this coast, but they are larger than any boiler in any steamer now, or at any previous time, on this coast. The boilers of the Constitution, if we are not mistaken, are smaller than these; but that steamer has four instead of two, as is the case with the Orizaba. So with regard to others of our largest class steamers.

**MORE SOAP ROOT.**—The Sacramento Bee of the 17th inst., notices the arrival in that city by railroad, of 1,500 pounds of prepared soap root—1,000 pounds of which came to this city, and 500 went up the river to Marysville. This article is now coming into general use in California as a substitute for curled hair, and at a price two-thirds less. As it abounds in nearly all the mountainous parts of the State, it may yet become an important article of production, and perhaps for export.

**A NEW STAMP MILL.**—Mr. A. B. Childs, an American, resident of London, England, has recently invented and patented what he calls an "Atmospheric Ore Stamp," which may be thus described: The piston (and stamp-head) is raised by an ordinary cam and shaft. The top of the stamp-stem is fixed in an air-chamber, like a piston in a steam cylinder. By means of proper valves, as the stem is forced up it creates a vacuum in the lower portion of the cylinder, by which great momentum and power is given to the falling stamp, as soon as it is dropped from the cam. It is claimed that by this arrangement as heavy a blow can be given by a 100-pound stamp, as by a six or seven hundred stamp, operated in the usual manner; while two of those stamps can be made to strike as many blows in a given time as ten ordinary stamps—doing the same amount of work. The advantage claimed is compactness and light weight of mill—an important consideration, where long transportation is required at a high price. The battery (of two stamps) is offered, complete, (without power) for about six hundred dollars.

## Foundry and Machine Work.

The San Francisco Foundry and Machine Works, owned by Messrs. Devoe, Dinsmore & Co., are turning out a large amount and variety of work at the present time. Saw-mills, steam engines, quartz mills, wrought iron work of every description, shafting, tubing, etc., are to be seen there in every stage of progress from the raw material up to the finished condition. They have just sent off an 80-horse engine, with sawmill complete, for Coos Bay; also a 10-stamp quartz mill, to be put up on a mine in Amador county, and a 5-stamp mill for a mine in Calaveras county.

Among the work in hand we noticed a 12-horse engine, which they are building for Coffey & Risdon, under contract for a flour mill in Sonoma county; also castings for the new Ensley Gas Company's works at Vallejo.

Several wine presses have recently been built at these works for parties in Sonoma county. They are also turning out large quantities of shafting and minor machinery for quartz, saw and flouring mills, at various localities in the interior, and up and down the coast.

The machine shops of this firm are constantly engaged upon various orders for general jobbing. Particular attention is paid here to all kinds of wrought iron work, forging by trip hammer, etc., etc. Among the novelties, at these works, we may mention Brown's Filtering Heater, which is used and made at this foundry. The object of this filter is to obviate the necessity of buying hydrant water for steam purposes. The proprietors assured us that several months trial of this Filter Heater has fully satisfied them of its value, and the economy of its use. The water which they are now using for steam is surface water, taken from within a few feet of the top of the ground, quite turbid, brackish, and highly charged with iron and other salts. It is pumped into a tank from which it is drawn into a close reservoir, divided into sections or chambers communicating by circuitous passages from one to the other. These chambers are stuffed with coarse hay or straw, which is renewed once in two weeks. The water passes into one end and is forced horizontally through the filtering material, from chamber to chamber to the other end of the tank, while the exhaust steam is at the same time discharged into it. Steam heats the water, and deposits whatever sediment it contains upon the straw, completely enveloping every individual straw with a coating of "scale." The water after passing through this filter does not deposit any more scale in the boiler than water taken from the hydrant. The saving thereby is quite an item; while the cost of purchasing and keeping up the filter is a mere trifle.

**DR. BUNNELL**, No. 611 Clay street, extracts teeth without pain, the patient simply breathing the chemically combined elements of air, oxygen and nitrogen. He has made an improvement connected with it, for which he has applied for letters patent (through the assistance of this office). This bids fair to become the Anæsthetic of the age. We are informed that it has been successfully administered to more than seventeen thousand persons by the "Colton Dental Association," and that it is becoming generally popular in the Eastern States, and that it leaves no unpleasant after effects, such as often follow the administration of other anæsthetics.

For the Pacific Coast.

We would call the attention of the trade to the superiority of

## "ARMES' STAR EXTRA BROOMS,"

Being made from selected materials by the best workmen.  
 They are unequalled for durability, fineness and beauty of  
 workmanship. None genuine except those bearing a star  
 and the fac-simile of the signature of C. W. & G. W. ARMES  
 on the label. Trade mark secured. Parties ordering this  
 Broom should specify "ARMES' STAR EXTRA," to insure  
 their getting the genuine article.

Our customers can always rely upon having their orders  
 promptly filled with goods of superior quality at the low-  
 est market rates.

ARMES & DALLAM,  
 215 and 217 Sacramento street.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

## FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

## Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
 FIRST—Set the Pan, A, level, by its inner rim.  
 SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
 THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
 FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

## References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL.....	Grass Valley, Nevada County.
GOLD HILL MILL.....	Grass Valley, Nevada County.
CONEY & BIGELOW MILL.....	Jackson, Amador County.
SPRING HILL MILL.....	Amador, Amador County.
GOLDEN GATE MILL.....	Volcano, Amador County.
OPHIR MILL.....	Placer County.
C. H. SCHNABLE'S MILL.....	Doty Flat, Placer County.
GOLDEN RULE MILL.....	Stewart Flat, Placer County.
BENTON MILL.....	Bear Valley, Mariposa County.
LOUISIANA MILL.....	Coulterville, Mariposa County.
RAWHIDE RANCH MILL.....	Jamestown, Tuolumne County.
PEOPLE'S MILL.....	Alleghany, Sierra County.
TYRON & CO'S MILL.....	Prescott, Arizona.
WOOLSEY & CO'S MILL.....	Prescott, Arizona.
NOYES & CO'S MILL.....	Prescott, Arizona.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
TRIUNFO G. & S. M. CO.....	Lower California.

And in use in many other parts of this coast.

These Machines are made of iron, thoroughly constructed and ready for immediate use.  
 For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have  
 Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of  
 pretended merit.

## Remarks:

Many Concentrators have been gotten up in this city. Some of these claim foreign  
 origin; others are of home production. The sonorous Greek names, with which some  
 of these have been dignified, ought, it would seem, to have entitled them to a better fate  
 than that which has befallen them. A large proportion of these machines are now  
 "numbered among the things that were." A few were still-born; never having had  
 an existence except in the shape of advertisements and cuts, prematurely prepared by  
 their too confident projectors. For one of these it was claimed, with a grand flourish  
 of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order  
 or in the way." Unfortunately, however, although it had a reasonable supply of legs, it  
 obstinately refused to run. Amputation failed to remedy the defect, and it now lies  
 forgotten among a heap of old iron,—a mechanical abortion.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works,  
 for 1866, pages 51, 53.

## CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

March, 1867.

JOSHUA HENDY, Patentee,  
 Union or Fulton Foundry, San Francisco.

## A. S. Hallidie &amp; Co.,

## FLAT &amp; ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH  
 less than that of any other kind of Rope of equal  
 strength, and it is four times as durable. Wire Rope does  
 not stretch or shrink by atmospheric changes; it has but  
 one-fifth the bulk of Hemp Rope; is spliced and repaired  
 in the same manner.

The attention of Mining Companies is particularly called  
 to our Flat and Round Hoisting Ropes, which have been in  
 use for a number of years by the leading mines on this  
 Coast, and to any of whom we refer those interested as to  
 the great advantages over any other kind of rope; effecting  
 a immense saving in expenditure for ropes, fuel, wear and  
 tear of machinery, stoppage of works, etc., besides increas-  
 ing safety of life.

Mining Companies, in erecting Hoisting Works, should be  
 sure and have their drums and pulleys of sufficient size,  
 whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—  
 very strong and durable—one third the weight of hemp  
 of equal strength, (saving in freight for remote localities).  
 Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire  
 Ropes—for Ships' Rigging, Derrick Gears, Ferry Ropes,  
 and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks  
 supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$ -inch diam-  
 eter, for hanging window shades; Signal Cord; Sash Pulley  
 on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel  
Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.		Steel Wire Rope.		Hemp Rope.		Chain.		Equivalent Strength.

Pamphlets containing data, with prices annexed, for-  
 warded free, by mail or express, on application to manu-  
 facturers. 25v14-3m9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Kart, screw and Drop Presses, Oiling Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quarts and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.  
**Old Boilers Repaired**  
**D. CAMERON.**  
6v12 1y

**MINING FOR BOULDERS.**—The Esmeralda Union says that Mr. J. J. Poor, of Aurora, has commenced "washing" for boulders about the hills near the Union Mill, of which he is the owner. The melting snow upon the higher hills furnishes him the necessary water, and he expects to make a "good thing" out of the operation. He hopes to collect boulders sufficient to keep his mill running a good part of the summer. Gathering up boulders for crushing is no new thing in California, and has sometimes been made to pay largely. The wonder is that no more of such work has been done.

**MORE MARBLE.**—It is said that a bed of marble has recently been discovered on the farm of Mr. Applegate, seven miles distant from Colfax. The marble is purely white, admits of a superior polish, and is pronounced equal to the finest Italian. The lode is situated only two miles from the Pacific railroad, and if proven to be as extensive as is anticipated, will be an immense fortune to the lucky owners.

**PETROLEUM FROM SHALE.**—In connection with the effort now being made at Corral Hollow, to obtain petroleum from shale, it may be interesting to state that from seven to eight million gallons per annum, are manufactured from the shale or refuse of the bituminous coal beds of Wales and Scotland. Large amounts of paraffine are also obtained from the same source. The average yield of the shale is about twenty gallons of crude oil to the ton.

**BAY RUM SOAP.**—Bay rum has from time immemorial been used for the healthiness it imparts to the skin. Mr. Hull, of New York, has produced a soap in which the article is incorporated, which will supersede the use of bay rum in the ordinary way, and is therefore very desirable in the nursery, bath room, or upon the washstand.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices

In this City,

STEAM ENGINES OF EVERY DESCRIPTION BUILT to order—Marine, Stationary, or Locomotive.

**HOISTING AND PUMPING ENGINES,**  
PORTABLE ENGINES, OF ALL SIZES,  
DONKEY PUMPS, Etc., Etc., Etc.

The attention of the parties engaged in shipping or inland navigation is called to the  
**Superior Workmanship**  
of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.  
2v12-3m

**A CONVENIENT BAG HOLDER.**—A correspondent of the *American Agriculturist* suggests as a convenient bag holder, a barrel with both heads knocked out and a few nails driven into one end. The open end of the bag is hung over these nails. When the bag is filled, the barrel may be lifted off. Many grain bags are too small to be fastened to opposite sides of a barrel. Hooks extending some inches from one side of the barrel would remedy this trouble.

**A NEW EMPLOYMENT FOR THE CHINESE.**—A correspondent of the *London Times* recommends that Chinamen be enlisted in the English army, for the reasons that they are hardy, strong, good-tempered, and can stand heat and cold; that they make excellent soldiers, and will eat anything, "from roast beef and plum pudding to rice and rats."

**B. F. HOWLAND, PHOTOGRAPHER,**  
Nos. 25 and 27 Third street, east side, near Market street, San Francisco.

Enamelled Cards, Ambrotypes and Sun Prints, executed in a superior manner. Small pictures colored and enlarged in any size, at one-half the price usually paid for such work. "Cartes de Visite" only \$24 per dozen; Views at \$1 per dozen. We warrant our work to be superior to any made in this city or State. Give us a call and see our specimens. 5v14-6m

### Copartnership Notice.

THE UNDERSIGNED HAVE FORMED A COPARTNERSHIP, under the firm name of D. A. MACDONALD & CO., for the purpose of carrying on the business of Sawing and Planing, and the manufacture of Doors, Sashes, Blinds, Mouldings and House Finish of every description, at the corner of Market and Beale streets, where we will be happy to receive a call from our old patrons.  
D. A. MACDONALD, J. H. MACDONALD,  
OS. MCGILL, HOWARD CHAPMAN.  
San Francisco, Feb. 1, 1867. 12v13-3m

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

which experience and science suggest, and is surpassed by  
none in completeness and perfection for the purposes it is  
designed. 9v14-3m

BLAKE'S PATENT  
QUARTZ CRUSHER.

## CAUTION!

The owners of the Patent for this valuable machine, in  
order to facilitate the protection of their rights against un-  
authorized infringers, procured, some time since, a reissue of  
the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to em-  
ploy in Stone-Breaking Machines Up-  
right Convergent Jaw, actuated  
by a Revolving Shaft.

All persons who are violating the Patent by the unau-  
thorized making, selling or using machines in which quartz  
or other material is crushed between upright convergent  
jaws, actuated by a revolving shaft, are hereby warned that  
they are appropriating the property of others, and  
that they will be held responsible in law and in damages.

Several infringing machines are made and offered for  
sale in this city, upon which Patents have been obtained.  
Manufacturers, purchasers and users, are notified that such  
Patents do not authorize the use of the original invention,  
and that such machines cannot be used without incurring  
liability for damages. BLAKE & TYLER,  
14v14tf Agents for the Pacific Coast.

## New Mining Advertisements.

Cordillera Gold and Silver Mining Company,  
Cibola, New Mexico.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-seventh  
day of April, 1867, an assessment of one (\$1) dollar per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold coin, to the Secre-  
tary, No. 321 Washington street, San Francisco, Cal.  
Any stock upon which said assessment shall remain un-  
paid on the twentieth day of June, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the eighth day of July, 1867, to pay the  
delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

HENRY R. REED, Secretary.  
Office, 321 Washington street, San Francisco, Cal. my25

Hanscom Copper Mining Company. Location:

Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-first day  
of May, 1867, an assessment of twenty-five cents (25c) per  
share was levied upon the capital stock of said Company,  
payable immediately in United States gold and silver coin,  
to the Secretary, at the Elma Iron Works, Fremont street,  
between Howard and Folsom, San Francisco, Cal.  
Any stock upon which said assessment shall remain un-  
paid on the twentieth day of June, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the eighth day of July, 1867, to pay the  
delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

JOHN HANSCOM, Secretary.  
Office, at the Elma Iron Works, Fremont street, between  
Howard and Folsom, San Francisco. Office hours from 8  
A. M. to 12 M. my25

Hoppe Gravel Mining Company.—Location of  
Works and Property: Grass Valley, Nevada County, Cal-  
ifornia.

Notice.—There are delinquent, upon the following de-  
scribed stock, on account of assessment (No. 14) levied on  
the fifteenth day of April, 1867, the several amounts set  
opposite the names of the respective shareholders, as fol-  
lows:

Names.	No. Certificate.	No. Shares.	Amount.
McAlmond, E. H.	32	75	\$75 00
McAlmond, E. H.	122	10	10 00
McAlmond, E. H.	133	40	40 00
McAlmond, E. H.	135	6	6 00

And in accordance with law, and an order of the Board of  
Trustees, made on the fifteenth day of April, 1867, so  
many shares of each parcel of said stock as may be ne-  
cessary, will be sold at public auction, by Maurice Dore &  
Co., at No. 327 Montgomery street, San Francisco, Cal. on  
Tuesday, the eleventh day of June, 1867, at the hour of 12  
o'clock noon, of said day, to pay said delinquent assess-  
ment thereon, together with costs of advertising and ex-  
penses of sale.

DAVID WILDER, Secretary.  
Office, No. 329 Clay street, San Francisco, Cal. my25

Mount Davidson Gold and Silver Mining Com-  
pany, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-second day  
of May, 1867, an assessment of one dollar (\$1) per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin, to  
the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain un-  
paid on the twenty-eighth day of June, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the fifteenth day of July, 1867, to pay the  
delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

G. PARDO, Secretary.  
Office, 141 Sutter street, San Francisco, Cal. my25

Nuestra Señora de Guadalupe Silver Mining  
Company. Location of Works: Tayoltita, San Dimas  
District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twentieth day of  
May, 1867, an assessment (No. 27) of one dollar (\$1) per  
share was levied upon the assessable capital stock of  
said Company, payable immediately, in United States gold  
and silver coin, to the Secretary, E. J. PFEIFFER, at the  
office, No. 210 Post street, or to the Treasurer, A. H. H. WELLS,  
at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain un-  
paid on the twentieth day of June, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Wednesday, the tenth day of July, 1867, to pay the  
delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

E. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco, Cal. my25

Rattlesnake Gold and Silver Mining Com-  
pany, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-second  
day of May, 1867, an assessment of one dollar (\$1) per  
share was levied upon the capital stock of said Company,  
payable immediately, in United States gold and silver  
coin, to the Secretary, 315 California street, San Francisco,  
California.

Any stock upon which said assessment shall remain un-  
paid on the twentieth day of June, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the fifteenth day of July, 1867, to pay the  
delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

JOHN F. LOISE, Secretary.  
Office, 315 California street, up-stairs, San Francisco. my25

### Union Copper Mining Company, No. 2.—Lodge or Claim situated in Copper Canon District, County of Calaveras, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate	No. Shares	Amount
Geo. Hardy.....	32	80	\$120.00
J. M. Byrne.....	34	50	25.00
J. M. Byrne.....	35	50	25.00
J. M. Byrne.....	36	50	25.00
Richard Newby.....	46	115	57.50
K. K. Stevenson.....	41	25	12.50
K. K. Stevenson.....	42	25	12.50
David Porter.....	38	75	37.50
Geo. Longdon.....	25	25	12.50
A. Tomler.....	26	150	75.00
J. R. Thibault.....	43	75	37.50
Ch. G. Grellet.....	45	150	75.00
J. P. Platt.....	29	149	74.50
John T. McLean.....	not issued	112	56.00

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of April, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dora & Co., at No. 327 Montgomery street, San Francisco, California, on the tenth day of June, 1867, at the hour of 12 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

OYE. TOUCHARD, Secretary.

Office, No. 416 California street, San Francisco. my25

### Mining Notices—Continued.

#### Butopolis Mining Company, Batopolis District, State of Chihuahua, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment (No. 3) levied on the eleventh day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate	No. Shares	Amount
Samuel J. Farran.....	1	20	\$40.00

Gray, Asaph.....	133	3	60.00
Lander, B. C.....	69	3	120.00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, Auctioneers, on the 21st day of May, 1867, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar30

POSTPONEMENT.—The above sale is hereby postponed until Friday, the 21st day of June, 1867, at the same hour and place. By order of the Board of Trustees.

my25 N. C. FASSETT, Secretary.

#### Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the first (1st) day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth (17th) day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 5 Government House, corner Washington and Sansome streets, San Francisco, California. may4

#### Cisco Seores Gold and Silver Mining Company.

Copala, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of May, 1867, an assessment of ten (10) cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, No. 323 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-second day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

Office, No. 323 Clay street, San Francisco. my4

#### Dixon Gold and Silver Mining Company.—Location of Works: Lander County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-second day of March, 1867, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of April, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the saleroom of Olney & Co., 418 Montgomery street, San Francisco, Cal., on the third day of June, 1867, at the hour of 12 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. G. WOOD, Secretary.

Office, 333 Montgomery street, San Francisco. my11

#### I. X. L. Gold and Silver Mining Company.—Location: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of April, 1867, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, in the store of J. O. Wood & Co., 418 and 419 Clay street, San Francisco, Cal., or to John G. Slaven, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. B. STEVENS, Secretary.

Office, 418 and 420 Clay street. my11

#### Lady Franklin Gold and Silver Mining Company.—Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1867, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.

Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. my4

#### Lyon Mill and Milling Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of May, 1867, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 5 Government House, corner of Sansome and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventh day of June, 1867, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-second day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 5 Government House, corner of Washington and Sansome streets. my11

## Crawford's Stump and Rock Extractor and Elevator.

STUMP AND SNAG PULLER.

PRICE OF MACHINES:—No. 1, 10 tons, \$200; No. 2, 15 tons, \$275; No. 3, 20 tons, \$350. Small Model Machines—weight 30 pounds—lift 1 1/2 to 2 tons, \$75; other sizes to order.

These Machines are adapted to all kinds of work, and where labor is scarce they are invaluable. Two men can work the machine. A few of their uses are: Loading boilers, granite, heavy ordnance in casemate, or any heavy body. For mountain teamsters they are of great value, lifting wagons, etc., clearing lands of stumps, moving boulders for miners, or for railway companies. There is scarcely any work of moving heavy bodies which they are not adapted to. Single Machines, or Right of City or County, and all information can be obtained by letter, or otherwise, by application to San Francisco, April 17, 1887.

[16v14coulm]

GRUB AND ROCK EXTRACTOR.

Office California Steam Navigation Company.

### STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. 2. Is the muller plate; 3. The Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

3v11t

**VARNEY'S  
PATENT AMALGAMATOR.**  
These Machines Stand Unrivaled.  
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.  
This Amalgamator Operates as Follows:  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill men are invited to examine these pans and setters for themselves, at the  
PACIFIC FOUNDRY,  
San Francisco.

**To Quartz Miners and Others.**  
NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the **HITCHENS' ORE PULVERIZER.**  
It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.  
In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

1v143m JAMES HITCHENS.

**To the Mining Community.**

THE UNDERSIGNED, WHO HAS HAD THIRTY YEARS constant practice in superintending mines, is now prepared to inspect and report on Mines and Mining Properties, and advise as to the management of the same. Office, 551 Harrison street, San Francisco.

16v14gr WILLIAM WILLIAMS,  
Practical Mining Engineer.

### Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the india rubber facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C.  
The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.  
Rights for the use or manufacture of this Valve, are for sale by  
V. CUSHING,  
120 Front street, San Francisco.

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public. See illustration and description of this Pump, published every other week in this paper.

### LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.  
CALIFORNIA REPRESENTS:—E. Stetson, Polson; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington Santa Clara County. Send for Circular to  
KNAPP & GRANT,  
Agents for California,  
310 Washington street, San Francisco

16v14 Eighth street, cor. Minna. gr

### QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

### First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.  
Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or  
J. B. HITCHCOCK,  
Millwright, Russ House.

### Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

8v13-1y Store Store, No. 123 Clay street, below Davis.

### FOR SALE!

**PATENT RIGHT OF  
HUNT'S WINDMILL** for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known.

Apply to  
E. O. HUNT,  
23 SECOND STREET,  
11v24 San Francisco.

### Markleeville Correspondence.

MARKLEEVILLE, May 4th, 1887.

### THE RECENT STRIKE AT THE TARSHISH MINE.

EDITORS PRESS: I have ever made it a point to write when the "spirit moves," and now as the snow has nearly all moved off our valleys and hills, and all vegetation is on the move, and travel is beginning to move through our county, and everybody is on the move to get "feet." In the vicinity of the Tarshish mine, at Monitor, I have concluded to have my pen move, and give you and your readers a little idea of what is going on in our county.

Several weeks ago the Schenectady Company struck a very rich ledge in the Tarshish claim at Monitor. The news was telegraphed to the daily papers, and you have doubtless seen notices in our county papers. Well, the news sped away faster than the "wings of the wind," and did, at that time and ever since, create some excitement in this county and elsewhere.

As soon as the ledge was struck, and an assay or two made, the superintendent had the work suspended till a dump could be built, and then in one day, on resuming work, something like a ton of good ore was got out and sacked; and in a very few days a number of tons were taken out and shipped to the Ophir mill in Washoe Valley, to be worked. Early this week the result was telegraphed to this county, and a grand ball gotten up in honor of Monitor's first brick. This ball came off last night at Monitor. As the brick was expected up on yesterday's stage, many bent their steps in the direction of the scene of war. The superintendent, Mr. Wilson, and the assayer, Mr. Graff, both went down with the ore and stayed with it till the silver brick was brought into existence, and both returned by stage yesterday, bringing the bullion with them. Quite a crowd had gathered at the stage office in Monitor when the stage arrived, and no sooner had the passengers got out, and the brick been brought to light, than three rousing cheers were given for Mr. Wilson, the superintendent, Mr. Graff, the assayer, and Monitor and her first silver brick.

The amount of ore taken down was some four and a half tons, but some of that was used to experiment with at the mill, and when it was discovered how it was best to work it, 7,000 pounds of dry ore was worked by the Freiberg process, and yielded an enormous brick. I copied the lettering on the bullion which I here give you: "Tarshish mine, No. 2,632, Van Wick & Co. assayers, Gold Hill, Nev., \$39.80 ozs.; gold, 0.16 fine; silver, 853 fine; gold, \$277.74; silver, \$926.18; total, \$1,203.92." So you will see the first effort from this mine proved a perfect success, the ore working over \$300 per ton.

Let it no longer be said that Alpine county has no mines; but on the contrary, had these mines been at such a distance from civilization that it had required a trip at sea in order to see, or had they been so far out on some sage brush desert that it would have been a weary and toilsome journey to have reached them, and after having arrived there, a man's eyes would have got so full of sand in ten minutes that he could not see a barn ten feet away, and the alkali water was killing off the cows, and everybody was sick. I say had all these difficulties been in the way, these mines would have been developed, and tons of bullion shipped monthly, for several years past. But no! Alpine county is unfortunately in California, and there can be no silver mines outside of Nevada or Arizona! But we propose to change the programme before the close of the present year, and show all the world and everybody else, that our county is destined to be the richest one in the State.

But I must return to my subject. Moved by the little stir and excitement, I made it my business to move when the spirit moves, and found myself at Monitor with the crowd yesterday. The silver bar was handled and talked over more than Mother Eve's first born, and if the folks have not quit it, the same thing is going on still.

The ball commenced rolling about eight o'clock, and the big silver brick was placed on the musicstand, as though the musicians were playing, or the dancers were dancing to the tune of "twelve hundred."

### A VISIT TO THE MINE.

At early dawn to-day, I left the sleepy headed and light-heeled, joyous crowd, and

began ascending the mountain by the zigzag trail leading to the Tarshish, and in due time I reached the mouth of the tunnel, where I got a candle and after groping my way 535 feet through a dark and narrow pass, with many dangers overhead, I arrived at the fountain-head of wealth, 300 feet below the surface of the earth. I profess to be a miner, and think I know something about ledges and wall rocks, and although I had heard many opinions expressed about this ledge, I must say that I was well pleased with the appearance of the body of ore that has already been brought to light. The tunnel cuts the ledge at nearly right angles, and has gone into it some sixteen feet sure, and there is no prospect yet of getting through. The richest ore lies in pockets, but those are not like the visits of angels. They are quite plentiful, and the entire ledge will doubtless pay exceedingly well, while the best ore will pay enormously.

I send you by mail to-day a sample of the good ore, but not as good as some I have seen. The company has suspended operations on the mine for the present, and are grading and preparing to build a large ore-house. More anon. SIRROM.

**STILL ANOTHER NEW TEXTILE.**—The New Orleans Academy of Science has recently listened to a paper descriptive of the new textile plant called "ramie." The sample shown was raised in Mexico by Don Benito Roedel, formerly at the head of the Horticultural Institute of Belgium. The fiber is said to be remarkably fine and silky, and from two to three feet in length, nearly as white as cotton in its natural state, fifty per cent. stronger than either flax or cotton, and far more productive than either. But few hands are required to raise this new plant, and it yields four or five crops per year, and is particularly suited to the soil and climate of Louisiana, Florida, Alabama and Texas. It is grown like cane, and is planted in lengths from the stubble.

**A Paying Newspaper for Sale.**

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quariz and Gravel Mining Districts in the State. Inquire at the office of the Mining and Scientific Press; or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v14lf

**JOHN BENCHLEY,**  
President.

**Gaston's Screw Grinder and Amalgamator**

—13—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequaled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and Fig. 2 the screw muller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immenso pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

On Hand and for Sale.

**THE CELEBRATED Self Generating Portable Gas Lamp.**  
This extraordinary Lamp produces its own gas by the vaporization of Petroleum, kerosene, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

**Directions for Use.**  
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.  
A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.  
When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed up with a little white lead, and the lamp is ready for use.  
Manufactured solely by JOHN A. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-3m

**Pratt's Abolition Oil.**

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Grains and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and 25 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 534 Sacramento street, opposite Whit Cheer House, San Francisco. 15v11-ly

**Mechanical Drawings.**

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

**HEALTH! HEALTH!**

To prevent this, purchase one of  
**Taylor's Stench Traps and Garbage Baskets,**

And promote the health, comfort and cleanliness of your family. [For description see Mining and Scientific Press, April 6, 1897.] Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v14lf

**SAN FRANCISCO BRUSH FACTORY,**

No. 211 California st., manufactures to order all kinds of  
**BRUSHES,**

At lower prices than cost of Eastern importation. Brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root fiber; also, Stucco Brushes from the same material. The Patent Ruston, Street, Stable, Fine and Flame Brush, for which they have the exclusive right for the Pacific Coast.  
All orders from the Interior promptly executed.

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**

**FOUR SIZES,**

8, 10, 12, and 15-Horse Power,

**HOADLEY'S.**

3 to 40-Horse Power.

**HITTINGER'S.**

**THREE SIZES,**

5, 7, and 10-Horse Power

**HITTINGER'S.**

**TWO SIZES,**

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.  
Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**  
Corner of Front and Market streets. 9v14-6ml5p

## HUNTER'S IMPROVED CONCENTRATOR.

Fig. 1.

The Patentee of the above Machine, has the utmost confidence in offering to the mining public, a Concentrator that in every respect meets with the wants of the Pacific Coast. From his experience of four years experimenting on the separation of sulphurets, he does not hesitate to give the strictest guarantee, and will refund the money if they will not perform what he claims for them.

## CONSTRUCTION.

The above illustration, gives a correct view of his improved Concentrator. The tables at the back end are suspended on iron hangers; the front or lower end rests on iron rollers. The tables weigh about 30lbs., and vibrato by the slightest touch, (the original tables weighed over 100lbs.) The lower end of the table strikes against spring steel fastened to the cross bar, and produces the percussion that moves the sulphurets over the high end; the sand and water passes off in front. The Scraper revolves and assists to move the sand off the table. The Feed Trough rests on rockers, on the frame, and is moved by a crank pin in the end of the driving shaft; the water trough also rests on the frame, doing away with all unnecessary weight on the table. The driving shaft is placed in front of the tables, giving free access to adjust the machine. The tables are set in motion by the eccentrics running in cast steel straps, giving a perfectly free vibration. The fourth of a horse power will run twenty tables; each table will work from three to five tons in twenty-four hours, saving from 80 to 90 per cent. of the metal contained in the ore.

Hunter's Concentrator, was exhibited at the Mechanics Fair in 1865, and received the first premium, a silver medal, over his competitor, the Prater Concentrator, as exhibited by Mr. Hendy.

In 1865 and 1866 the patentee sold and put in a number of Concentrators at Grass Valley, that were afterwards thrown out, to make room for a base counterfeit, in imitation of the above machines, and for the purpose of avoiding paying for those contracted for, which proves how easily one of the best improvements on this coast can be blasted by an unscrupulous and unprincipled superintendent. The above explanation will show why the machines were thrown out. The annexed certificate proves the appreciation that others have of his machines, and the following proposition proves the confidence of the inventor. The patentee is prepared to test against any Rocker or Concentrator built on this coast, and guarantees 20 per cent. better results than from either; (it is immaterial how many certificates of merit said Concentrators can produce). The sulphurets, when concentrated, must contain less than 3 per cent. of sand.

The patentee is prepared to take contracts for concentrating gold, silver, galena, tin, copper and cinnabar ores, on shares, receiving a certain per cent. of the sulphurets as shall be agreed upon; or he is prepared to put them up in mills under his directions, and guarantees to save from 80 to 90 per cent. of the sulphurets.

## OPERATION.

The sand is run into grading boxes—three different grades can be obtained. Each grade—the coarse, the medium and fine—are run on to tables adjusted for each particular grade. The sand runs continuously into the distributing trough, and is fed near the centre of the table. The hind end of the tables are about half an inch higher than the front. By the percussion blow the current is checked, and the sulphurets, however finely crushed, are thrown down by the sudden check, and pass below the surface of the sand on the table, where they are protected from the action of the water, and gradually move from the point where the blow is given, producing a continuous discharge of the sulphurets into a box prepared to receive them, thereby saving the finest particles of metal that would float in the water, which by the centrifugal force, or the ordinary means of saving them, are wasted; the short, quick motion and percussion produces trituration sufficient to amalgamate the finest particles of gold on the plates of the table also for collecting the floured quicksilver and fine particles of amalgam. The sand is held in suspension and floats off with the water, assisted by the motion of the scraper.

The machines, as they are now constructed, require scarcely any attention to run them: two or three tables can be built in one frame, using one shaft and one belt to drive them. The Concentrators are so constructed that there is no possibility for them to shake to pieces. The tables are so light that the slightest blow produces the necessary vibration, therefore obviating the objections that many had to the original tables. For working heavily sulphurated silver ores, concentrate in front of the battery, then pass the sand into a revolving screen of six thousand meshes to the square inch; the slum and water pass through and is then run into a reservoir, and allowed to settle before drawing off the water; treat the sulphurets and slum as the character of either may require, thereby obviating the roasting, or treating the rocky portion by fire process, and extracting as high a per cent. as is now obtained, and for less than one half of the present cost. For working cinnabar ore of a low grade crush and concentrate the sulphurets of mercury, and use the ordinary retort for silver ore; the cost for crushing, concentrating and retorting, is much cheaper than using the ordinary furnace; from experiments recently made the results were the most satisfactory, and for all classes of sulphurets for shipping they will contain less than three per cent. of sand.

ORIENTAL MILL, WISCONSIN HILL, May 3d, 1867.

A. HUNTER, Esq., San Francisco.—Dear Sir:—The four concentrating tables recently put up in the Oriental Mill work to my entire satisfaction for saving the sulphurets; also the fine gold and quicksilver that escapes from the battery. The four tables will work about fifteen tons in twenty-four hours, and perform all you claim for them.

Yours,

D. S. HOSMER, Supt. Oriental Mill.

## HUNTER'S PATENT EUREKA AMALGAMATOR.

I beg to submit to mill men, and parties operating in gold and silver mines, for their consideration, one of the best improvements ever offered for saving the fine float gold that is wasted by the present process; also, for reducing the sands as they pass from the battery. Each machine will work below a five stamp battery.

## CONSTRUCTION.

The machines now used are four feet eight inches square on the bottom. The pan J is made of cast or boiler iron (for continuous working), seven inches deep; the sides are lined with wood, K, one foot deep, with inside lining of copper plate. The bottom is covered with iron dies, E, four inches wide by one and a half inches thick, with strips of wood, a, a, a, alternately set on end; the rubbers D are made of wood 4 inches wide by 3 3/4 inches thick, bolted to cross piece B; the upper part of the rubbers are rounded and covered with copper plates; the bottoms are shod with iron; the discharge end F is level with the top of the rubbers; two machines are built in one frame, giving a reverse d movement, preventing any jar on the machine. One shaft and one pulley and belt run both machines. The rubber frame B is suspended by iron hangers, C, to top frame A, and adjusted by screws d.

## OPERATION.

By means of the shaft and eccentrics the rubbers are set in motion; the shaft revolves sixty times per minute, or 120 movements of the rubbers. As the rubbers pass from, a current is formed by the pulp passing over them, forcing the heavy sand under them, and as the rubbers return the heavy sand is met by the opposite current, and kept there until crushed by the force and weight of the rubbers; the gold is amalgamated on the plates, and the fine particles of mercury that escape from the battery are collected in the machine; there is no packing of sand in the machine when the mill stops, therefore requiring no attention to run them (only for oiling). For working by charges, as a grinder and amalgamator, the sides of the box are 18 in. deep, sufficient to hold 12 cwt. at a charge, and arranged with a steam chest at the end for heating the pulp. Also the same machine, when used as a settler, has given the most satisfactory results, the motion and movement having a tendency to collect the quicksilver into its original state; for using them as a settler if built of wood they can be built for a small price in the mill; all that is required for their success is to give them a trial.

## ADVANTAGES.

The advantages claimed by the patentee are—1st, the cost is less than one half of other Amalgamators; 2d, it requires about the fourth of a horse power to run one machine; 3d, they only weigh from 15 to 20 hundred pounds; 4th, they do not waste quicksilver, but have a tendency to collect that which is wasted from the battery; 5th, they can be placed in any mill without any additional expense for power.

There are five of the above machines now running in the Eureka Mill, Grass Valley, where they can be seen in operation; also two at the Pittsburg Mill, Nevada City. The following order I received from Wm. Watt, Esq.: "After a trial of two weeks of your Eureka Amalgamator we have cleaned up and found it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries; we run through it all the pulp that passed over the blankets from 5 stamps. I am highly pleased with it, and I think it is the best machine after blankets or plates I ever saw. It reduces the coarse particles of sand, and makes the pulp more uniform in size, and requires very little power to run it. But the best recommendation I can give it is, that I want four more. Will you please go to the Vulcan Foundry and order them."

Price of the Eureka Amalgamator, two machines built in one frame,.....\$250 each.

Price of Hunter's Improved Concentrators, two tables built in one frame,.....\$150 each.

The above machines can be seen in operation at the Union Foundry from 1 to 2 o'clock, P. M. Orders addressed to the Union Foundry, the Vulcan Foundry, or the Fulton Foundry, will be promptly attended to. Parties wishing further information, will please address

ANDREW HUNTER, Patentee, Union Foundry,  
Or ALBERT MOORE, Agent, Fulton Foundry.

## HUNTER'S CEMENT AND GRAVEL WASHER,

For Washing Cement and Gravel, obviating the Crushing of the Cement and Gravel.

It is a cylinder of about twenty feet long, and three feet diameter. The under part or lower half is made of wood and lined with iron, leaving openings lengthwise of about a quarter of an inch wide, for the fine sand and gold to pass through into a bath of quicksilver underneath. The rock and gravel is discharged continuously at the lower end. The upper half of the cylinder is covered with sheet iron. It is supplied with water from a large water pipe on top, with discharge pipes every foot, securing an even supply the whole length of the cylinder. In the center, passing through the cylinder, is a large shaft with arms or teeth set every three inches in a spiral form. The teeth are made of wrought iron, faced with cast steel. It is claimed that one cylinder will work one hundred tons per day, using about ten horse power. The cost of a machine will be about one thousand dollars. A model of the above machine can be seen at the Union Foundry, San Francisco.

**ACIDS AND CHEMICALS.**—We took occasion, several months ago, to notice the incorporation of the Golden City Chemical Works, and at that time called the attention of the public to some of the objects and aims of the association. In a recent visit to the laboratory, corner of Seventh and Townsend streets, we found the different departments of this extensive establishment fully equipped with the necessary machinery and apparatus for manufacturing sulphuric, muriatic and nitric acids, together with chemicals of all descriptions, not only in quantities sufficient for the wants of this coast, but in quality guaranteed to give entire satisfaction to the trade—the acids and other products from the Works being made chemically pure—while furnished at a little more than one-half the rate of the imported, which come to us so diluted, or are so deteriorated on the voyage from the East or European ports as to render them, in some instances, almost valueless, if not injurious.

It is well known that much of the wear and tear of amalgamating pans is caused by the use of sulphuric acid containing nitric and nitrous acids; that much of the European article being made from arsenical ores is unfit for use as a test for arsenic where life itself may depend upon a correct analysis, and that the sulphuric acid found in the market usually contains more or less of sulphate of lead, derived from the vessel in which it was prepared.

This acid at these Works is hoiled in glass instead of lead, is chemically pure, entirely free from the objections mentioned, and is to the eye clearer than the clearest crystal.

The sulphur is now mostly supplied from a mine belonging to the company, located in Colusa county, at about one-half the cost of that hitherto used.

The carboys for containing the acids—five thousand of which have been ordered from the Pacific Glass Works at the Potrero—are represented to be made of better glass, and to be superior in every respect, to those brought from the East.

**CALIFORNIA GRINDSTONES.**—Information concerning material for grindstones is desired by a party in this city. Any one who knows of the existence of a ledge of stone suitable for this purpose, in a convenient location on this coast, will do well to inform this office of the same without delay.

## Hunt's Globe Pump.

One of the most diligent and indefatigable inventors on the Pacific coast is Mr. E. O. Hunt, the proprietor of the well known machine shop and factory at No. 28 Jessie street, in this city. His is a veritable "old curiosity shop," which is well worth the while of the curious to call and see. He will show you horse-powers, windmills, pumps, cutting shears, rifle projectiles, improved pavements, etc., etc., almost without number, and all of his own invention and manufacture. We have already, in times past, illustrated several of his in-

ventions, and now add another, which he offers as an improved pump—a strong and durable machine for raising water by wind, steam or horse-power, and to any height desirable and commensurate with the power employed. This pump is quite extensively employed for raising water into tanks by wind power. He manufactures six sizes, with from three to eight-inch chambers. The pump is adapted to both shallow and deep wells. By having a chamber at the bottom of the well connected with a pipe, and a rod to connect with the plunger and to pass up through the pipe and globe to the level, water may be forced from any reasonable depth. These pumps have been in use for several years on this coast, and have given good satisfaction. They are fitted for iron pipes; their construction is very simple, and any needed repairs can be readily made.

The illustration herewith presented is one of the smaller size, designed to be placed upon the platform over a well and to be worked by hand. Power, however, can readily be attached when desirable. Hunt's windmills are well known throughout the central portion of the State. Great numbers of them are in operation, chiefly for pumping water, and in nearly all cases they are accompanied by some one of the various description of pumps which he manufactures.

## Petroleum Fuel for Steamers.

The recent inauguration of steam communication between this city and the ports of China and Japan, involving an ocean voyage of more than double the length of any heretofore attempted, without coaling stations, has exhibited, in a striking manner, the necessity for a more condensed fuel than that furnished by coal. Of course the hydrocarbons, in some one or more of their various forms, is the only source to which we can turn for this desideratum. Numerous experiments have been made by both our own and the English governments, and by private individuals of both nations, to devise a practical and economical mode for substituting either crude petroleum, or some of its resulting products, for coal. The advantage of a successful result to such experiments would be of inestimable value to the world; and the end sought may now be considered the great mechanical and scientific problem of the day.

The earlier experiments met with very little favor, either from scientific men or eminent engineers. Science labored to point out the impossibility of the thing; but it failed to stifle the inventive genius of the age, which has been now for several years actively engaged in efforts to bring the investigations to a successful issue. The progress which has been thus far made has effected a most marked change in the opinions of many who at first had no confidence whatever in the scheme. In fact, the successful accomplishment of the thing is now pretty generally considered a mere matter of time.

Two sets of experiments are just now attracting the attention of the world to their several efforts, both of which are full of promise. The first is that which originated with Col. Henry R. Foote, of Tennessee, and which is being put to practical test in Boston on the iron steamer *Palos*, a fourth-class gunboat. This experiment was commented on at considerable length in the *Bulletin* of this city, of the 28th ult. The apparatus consists of a small iron box, or retort, in place of grate bars, into which the oil (petroleum) is carried by a small iron pipe, and vaporized immediately on its entrance. Decomposed or superheated steam is also carried into the box, into which air is at the same time forced; the whole forming a mixed gas, which escapes from the retort through some nine hundred burners, more or less. It is said to burn with a clear, intense blue flame, completely filling the furnace and flues, or tubes.

### ANOTHER PLAN.

Very much the same thing as the above, is being accomplished in England by Messrs. Wise, Field & Aydon, who are able to burn even the waste of gas houses and oil refineries, and who might also use the crudest of our natural California oils. The *London Mining Journal*, speaking of one of their recent trials, says:

The plan is very simple, and most effective. The oil is allowed to fall through a narrow orifice in a continuous stream (in

the present case the worst kind of creosote refuse was used) about one-eighth of an inch in diameter, or, in other words, flowing at the rate of about three gallons per hour. As the oil falls vertically, it is met by a superheated steam-jet, which blows the oil in a cloud of spray against hot tiles and lime on a coal grate, a coal fire being first used to get up steam for the superheated blast. The apparatus was fitted to the furnace of a Cornish boiler, and, with the consumption of oil stated above, the steam was maintained at a pressure of from 32 pounds to 35 pounds per square inch, and keeping going the engines usually worked by the boiler with the furnace burning coal. The amount of water evaporated was ten cubic feet per hour for 100 square feet of surface of boiler.

The cost of the material used in these experiments is from \$7.20 to \$12 per ton in England. Crude petroleum can be delivered in this city, by the quantity, for about \$24 per ton, or less than eight cents per gallon, as soon as a demand exists sufficient to warrant the construction of wharves and suitable vessels for the business, so as to do away with the costly use of barrels. The English experiments, with a material inferior to our crude oils, cost twelve cents per hour; the same work costs, with the best Auldare coal, thirteen and three-fourths cents per hour. In the absence of actual experiments it would be impossible to determine the exact superiority of our crude oils over the material used in the English experiments.

In the English experiments, taking petroleum at eight cents per gallon, the fires could have been maintained at the rate of twenty-four cents per hour. There were present at the experiments Prof. Abel, Mr. Frederick Field, F.R.S., Mr. D. K. Clark, C.E., Mr. Campbell (of Messrs. J. Brown & Co.), Mr. Edward Field, C.E., Mr. Aydon, C.E., Mr. Hugh Barclay, Mr. A. Shanks, C.E., Mr. Wm. Lloyd Wise, Mr. Hope, and others.

**COMMENCEMENT EXERCISES.**—The fourth annual commencement exercises of the College of California, at Oakland, will take place on Wednesday next, June 5th. The annual address will be delivered by Rev. A. L. Stone, D.D., and the poem by Frank Bret Harte, Esq. The customary associated *Alumni* supper, with interesting and attractive speaking, will come off in the evening. This association is intended to embrace all college and professional graduates on the Pacific coast. Its annual gatherings have already established for it a reputation for excellence and interest which is well known throughout the State. It is to be hoped that all who can, will prove their interest in its success by their presence at its approaching annual festival.

**CHALK MOUNTAIN.**—Mr. Buffington, Secretary of the Chalk Mountain Blue Gravel Co., has exhibited to us a sample of coarse gold, amounting to \$1.50, washed from three pans of dirt from the company's claims, by the Superintendent, S. N. Stranahan. It was from hydraulic ground, which the company intend to commence piping soon.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## The Reese River Country and its Mines.

BY A. J. HOWE.

(Continued from Page 322.)

## PARADISE DISTRICT.

Fourteen miles further south we come to Paradise District, similar in many respects to the one we have just left, but situated several hundred feet higher. Here, again, we find twenty-five or thirty large lodes almost totally undeveloped, many of which produce very rich ore at the croppings. Like Last Chance, the district is owned by one company, residents of Ellsworth, in Mammoth District. There can be no doubt with regard to the value of this property, if in the hands of a company that controlled means to properly develop it and erect reduction works. The country rock here is of granite and syenite. Several of the lodes show remarkably rich copper ores, while the same is said to assay as high as \$230 per ton in silver. Thirty miles further south brings us to

## VOLCANO DISTRICT.

This is one of the most interesting sections of Central Nevada. With its gold, silver, copper, lead and quicksilver, Volcano can scarcely fail of attracting capital at an early day. The district was discovered and organized by Samuel McKean and others, from Mammoth, early in the spring of 1865. Their attention was first attracted by an immense lode of reddish-looking substance, which was suspected by the party to be cinabar. Specimens were taken to Austin, and by numerous tests yielded quicksilver, some portions of it from the croppings as high as six per cent. A company was immediately organized, and a shaft sunk 170 feet. It appears this shaft did not follow the direction of the lode, consequently the ore at that depth is yet untested. Lying higher up the mountain, in limestone, are numerous large veins of copper, showing all the varieties and combinations, from the beautiful green and blue carbonates, peacock and bronze ores, to the rich red oxides, yielding eighty per cent. Other veins produce ores that assay up in the hundreds in silver, and again lodes of argentiferous galena occur, which are also rich in free gold. Smelting works have been erected five miles further south, the result of which I am now unable to give. Almost chemically pure brimstone is found herein abundance, while vast beds of salt are found in the valleys. Coal has been discovered by the Quicksilver Company, which they claim to have used in sharpening their tools.

The most interesting portion of Volcano is its vast bed of marine fossils which occur here. These fossils are found in great variety, from the minute bivalve to the huge coiled ammonite, or serpent fossil, three feet in diameter. Here we also find the most beautiful wood petrifications, translucent and delicately tinted with pink, yellow, jet black and pearl white. The fracture, when broken in any direction, is as glossy and smooth as the highest polished marble; the rings of annual growth, knots and bark are left distinct and perfect. Even the pitch that once oozed from the tree is found in pendant, pearly drops of veritable amber, clinging in the cavities of the trunk. These trees were undoubtedly a variety of pine which is now extinct.

Volumes might be written of this interesting region, and the reader taken through a continuous succession of mining districts, all rich in gold, as we approach the Sierra Nevada; but neither belonging to the object implied by the heading of these letters, I will merely mention by names the famous gold region of Willson's District, on East Walker river, thirty miles west of Volcano, and Pilot and Columbus Districts, situated the same distance south.

We will now pass from the Mammoth

mountains, southeasterly, over the dry sage-covered and sandy plains fifty-five or sixty miles, to Silver Peak, which we find in a broken range of mountains directly south of the southern extremity of the Toiyabe.

## SILVER PEAK DISTRICT.

In the winter of 1864-5, two brothers, named Robinson, and their neighbor, Smith, who then occupied and still own the meadow land in Smoky Valley lying opposite Ophir Cañon, visited this region with ox teams for the purpose of procuring salt for the mills at Austin. While on the mountain southwest of the great salt deposits, their attention was attracted by large quantities of extremely rich float quartz, lying on the hillside. This they followed up, and discovered the Vanderbilt lode. They loaded their teams with this surface ore and started for the nearest mill, which was 130 miles distant (Austin). The average lot yielded \$180 per ton. This created considerable excitement, inducing the thorough exploration of the southeastern portion of Nye county, which has resulted in the discovery of the wonderfully rich districts of Silver Bend, Northumberland, Danville, Moray, Hot Creek, Empire, Milk Springs, Revville, etc., the reported richness of which must stagger the most credulous; nevertheless they are true, and not overdrawn. The Robinsons soon sold their mine for a large sum, and early in the spring the old mill then standing at Jacobsville, near Austin, was removed by Mr. S. B. Martin to this district. Its ten stamps were very soon put in operation, and for a short time turned out large quantities of bullion; but the mill being constructed for wet crushing, and the company having no facilities for roasting the ore, they found that more silver was lost in the operation than saved, consequently the mill was closed. Arrangements were subsequently effected at the East, by the organization of the Great Salt Basin Company, for operations on a magnificent scale, and are now in progress, among which is the construction of a 40-stamp mill. This company, I believe, own the greater number of the lodes here that were found subsequent to the Vanderbilt, the most valuable of which appear to be the Pocastello and Sisson. A few miles west is situated Red Mountain, famous for its gold mines. Here a small mill of three stamps has been in successful operation since May, 1865. This property has recently come into the possession of the Great Salt Basin Company, and will be worked in connection with their silver mines at Silver Peak. The ore can be taken to the mill at the latter place by cars (tramway) with the greatest facility. The general formation of this, as well as Silver Peak District, is of black and grayish slate, while in the vicinity of the mines at the latter place belts of limestone occur, in which are imbedded marine fossils in considerable variety. The growth of timber in these mountains is not so large, nor near so abundant, as in those further north.

South and southeast of Silver Peak, along the borders of the dreaded and unknown Death Valley, a few hardy pioneers have explored sufficiently to determine the existence of a vast extent of country filled with gold and silver lodes. The tide of prospectors is setting that way, and during the coming spring and summer scores of new districts will undoubtedly be opened. Nearer Silver Peak, in a southeastern direction, a number of very rich gold districts were discovered, and to a slight extent developed. Of these I will give a description in a future letter.

We will now return north along the east slope of the Toiyabe Range. Thirty miles north we reach

## SAN ANTONIO DISTRICT.

This is about ninety miles directly south of Austin, and is located in a low detached range of mountains, which is moderately supplied with wood, in places quite abundantly as at Indian Springs, a few miles north of the mines. This district was discovered in 1863, and has in former times been considered among the richest districts of the Reese River region. Until the discovery of Hot Creek, the richest specimens of horn silver invariably came from here. The ore in many of the lodes is beautifully variegated with green and blue carbonates, while at the same time it is immensely rich in chloride of silver at the surface. The horn silver occurs lower, in thin leaves or films lining the seams. The formation is, to a great extent, slate—narrow belts or dikes of a porphyritic formation are intruded.

At Indian Springs, a 10-stamp mill was completed in January, 1866. It ran for a short time on ores from the mines ten miles south; but it seems to have been, like all the earlier built mills of this region, put up before the mines were sufficiently opened

to keep it steadily running. Taking our way northward, over dry and somewhat sandy sage-covered plains, fifteen miles brings us opposite the southern extremity of the Toiyabe range. Following Smoky Valley along the east base thirty miles north of San Antonio, we reach the mouth of Ophir Cañon, in Twin River District; before reaching which we pass several mining districts, the first of which is Hot Springs, ten miles south of Ophir, and the next is South Twin River, five miles south of Ophir and adjoining the original Twin River District. These are so little developed that we will not give them mention at present.

(To be Continued.)

## Facts About Patent Matters.

## NUMBER ONE.

It has long since become an acknowledged fact that no nation has made such rapid progress in improvements in labor-saving machines as our own; and more especially in this true of agricultural implements. The fame of our reapers, threshers, etc., has become world wide; and the value of these and similar inventions to our own people is beyond the power of any man to estimate. The great bulk of these improvements have been made within the last twenty-five years, and their progress has been constantly accelerated, increasing annually in arithmetical ratio; and as nearly or quite all these improvements or inventions are connected more or less directly with patents, it is equally important that the public should know somewhat of patents—what they are, how they originated, to whom and for what granted, which valuable, and which not, how to obtain them, etc.; and it is for the purpose of furnishing the numerous readers and inventors with this information (as fully as can be in so brief a space) that these letters were written. And now let us inquire in the first place—

## WHAT IS A PATENT.

The word patent means open, or to open—hence Letters Patent, open letters—open to the public, to make public, make known; as, when we say a fact is patent, we mean it is known publicly or generally, inferring that everybody knows it. A Patent, or Letters Patent, is a document given by the proper authorities, granting some exclusive privilege or right, to a particular person or persons. In Great Britain, lands, franchises, degrees of nobility, etc., are conferred by the Monarch by granting Letters Patent. With us, however, our laws wisely forbidding the establishment of a nobility, etc., the meaning of the term is confined to the granting by the government of the exclusive right, for a term of years, to make and sell any "new and useful art, machine, manufacture or composition of matter," invented by the applicant, and not before known or used by others. Having thus briefly stated what a patent is, our next inquiry will naturally be as to the

## ORIGIN OF PATENTS.

Patents are known only to civilized nations, and unknown outside of Europe and America. They owe their origin entirely to statutory law, being unknown to the common law. England appears to have been the first to adopt the wise system of stimulating invention by the creation of a patent law, it having existed there for at least 200 years. France and our own country adopted it simultaneously, a short time prior to the beginning of the eighteenth century. And here it may not be amiss to add a brief

## HISTORY OF OUR PATENT OFFICE.

The first patent law was approved April 10th, 1790. Applications were to be made to the Secretary of State, Secretary of War, and Attorney General. All persons, without reference to nationality, could make the application, the fees being \$3.70 with the addition of ten cents per folio for the specification. On the 21st of February, 1793, this law was repealed, by the passage of another much more full, by which the fee was raised to \$30, and the benefit of it was confined exclusively to citizens of the United States. The application was to be to the Secretary of State; the patent to be examined or revised by the Attorney General, and bear test by the President. By the act of April 17th, 1800, the privilege was extended to aliens of two years' residence in the United States, and the act of July 13th, 1832, only required the alien to be a resident at the time of his application. On the 4th of July, 1836, an act was passed providing for the appointment of a Commissioner, Chief Clerk, one examining clerk, and three other clerks, one of whom was to be a competent draughtsman, and a messenger. That was the origin of the present Patent Office Bureau. At that time it occupied a portion

of the General Post Office building, and when that was destroyed by fire, December 15th, 1836, all the models, records, etc., of the Patent Office were also consumed. By act of March 3d, 1837, Congress provided for recording anew such of the patents destroyed, and assignments thereof as could be obtained, and the officers were directed to obtain duplicates of the most important models burned, provided the amount thus expended did not exceed \$100,000. Several amendments have been made to the patent laws from time to time since, enlarging the powers of the Commissioner, and increasing the force employed, to meet the wants of the growing business of the office, until now over twenty persons are employed, as examiners alone; in addition to a large number of clerks who are also employed for other purposes, such as copying, recording, taking care of the drawings, models, etc., while a large number of females are also kept busy copying the specifications after the applications have been examined.

The act of 1861, increased the salary of the Commissioner one-half—from \$3,000 to \$4,500, and also added \$500 to the salary of the Chief Clerk, and \$300 to the Librarian's. By that act, the examiners were made independent judicial officers, instead of being, as previously, mere assistants to the Commissioner. They now make their decisions upon their own responsibility; and such decisions cannot be controlled by the Commissioner, until they come before him by the regular process of appeal, provided by law.

The act of 1861, also created an Appeal Board, composed of three members, at a salary of \$3,000 per annum each, with a clerk at a salary of \$1,000. All appeals from the decision of the Examiners must be to this board, who have the power of affirming or reversing the decision.

It is a question as yet whether the creation of such a Board is any benefit to the office or the public. One feature of it certainly seems wrong, for while the Board adds nothing to the income of the office, it takes \$10,000 per annum therefrom; and as the patent office, alone, of all the government bureaus is required to be self-sustaining, it is clearly wrong to burden it with this extra expense, while the income of the office is so small that many of the examiners cannot get the pay which the law gives them for the duties performed, and which pay, at most, is far less than that of this Board, while their duties are equally as important, and much more onerous.

**COLD IN RUSSIA.**—The cold, during the past winter in Moscow, Russia, has been such as has not been experienced there for many years, the thermometer descending even as low as 51½° below zero, Fah. This extraordinary cold froze petroleum, and put out the public lights of that description, but it had no such effect upon the gas light, which continued burning without intermission, although reports were circulated to the contrary.

**TO PREVENT A BLACK EYE.**—Immediately, on the eye, or any other part of the face or body being struck with force enough to make it turn black, apply a cloth wet with water just as hot as you can bear it, and continue the application for fifteen or twenty minutes. By this means the blood, which has a tendency to coagulate and turn black, will be kept thin and pass off through its natural channels, and leave the eye, or other part swollen, perhaps, but free from blackness.

**THE EARLIEST UNIVERSAL EXPOSITION** of which we have any record, was held at Rome, in the days of Nero. The philosopher and moralist, Seneca, gives the following account of it: "I was present, the other day, at a solemn exhibition of the wealth of Rome; there I saw statues which were marvels, perfect masterpieces; exquisite stuffs and draperies, and costumes brought from countries even beyond the Roman frontiers," etc.

**WORKMEN ON THE CENTRAL PACIFIC RAILROAD.**—The foremen on the Pacific Railroad are now instructed by the contractors to employ all the white men that offer, not only as mechanics, but for grading and other common labor. They will not be worked with Chinamen. The gangs are gradually working their way back toward the summit as the snow disappears.

## Mechanical.

## The Manufacture of Sewing Machines.

Very few people have any adequate idea of the immense number of sewing machines which are daily turned out in this country. Gentlemen best acquainted with the business, estimate that the entire number of these useful machines made in the United States to the close of 1866, was about seven hundred and fifty thousand. The demand for them is constantly increasing. Every machine, if legitimately made, is reported to Elias Howe, the original inventor, who is entitled to a small royalty on each one, as no machine can be made without the use of a portion of his patent. By the reports made to him there were about 200,000 made during the year 1866; and he is of the opinion that at least half as many more are made by unlicensed makers—mostly in Canada—so that during last year there were probably at least one thousand sewing machines made for each working day in the year! This, however, need not be so very extraordinary when it is considered that their use has now become universal, being employed in every civilized country on the globe, and doing the work, daily, of millions of hands. Almost one-fifth of the machines made in the United States are exported to foreign countries, and nearly all those made by unlicensed parties are sold abroad.

## THEIR UNIVERSAL APPLICATION.

By means of the various improvements and attachments, which have from time to time been added to the original machine, it is now made to perform nearly all that the needle ever did or can do. It seams, hems, tucks, binds, stitches, quilts, gathers, fells, braids, embroiders, and makes button-holes. It is used in the manufacture of every garment worn by man, woman or child. It is employed in the manufacture of hose for the miner and for the firemen, in sewing leather of all kinds for the shoe-maker and the trunk-maker. Mail bags, sails, awnings, valises, and every description of heavy work, where the needle and awl have been the sole implements of manufacture, are now made largely by the sewing machine. As operators have increased in skill and the sewing machine has been improved, the applicability of the instrument has been still more universally reached. Skillful artists have appeared, and a kind of genius has been developed in the use of the sewing machine, by which marvels are executed upon it, as skillful players execute marvels upon the piano-forte.

## ANOTHER PECULIARITY

With regard to this machine, is the fact that the mechanics of no other country have been able to imitate the American machine in its perfection. Foreigners can no more make a Yankee sewing machine than they can make a Hoe's printing press, or a Yankee clock. The effort has been made in all three cases, and signally failed. To start a sewing machine manufacture in Europe, which could compete successfully with the American article, would involve an expenditure of two millions of dollars for machinery, and the importation of a score or two of Yankee foremen and workmen. Even then the risk would be too great for the expenditure involved.

THE DIAMOND DRILL is being successfully and economically used, on a large scale, at the tunnel of Tarase, on the Bourbonnais Railway, in France. It is worked by water power, and  $3\frac{1}{4}$  feet in depth per hour is drilled in very hard rock. The cheap diamonds from Borneo, are used, with very little destructive effect to the drill or gems.

ALLOY FOR HARD TOOLS AND BELLS.—Twenty parts iron turnings or tin waste, eighty steel, four manganese, and four borax. To increase the tenacity, the proportions may be varied and two or three parts wolfram may be added.

HYDRO-PROPULSION.—Our readers will recollect the notice we made, some time since, of an invention in this city to propel a steamer without an engine or wheels. The invention was founded on the principle of "hydro-propulsion," and was claimed as an improvement of the application of that principle in England, as illustrated in the government steamer Water Witch, which was propelled by columns of water raised by an engine, while the invention of Mr. Marquis raised the water without the use of an engine, by applying the steam from the boiler direct to a steam-siphon pump.

There appears of late to be quite a change of tone among English engineers with regard to the possibilities of this form of motor. The experiment, which was at first pronounced by them a total and inevitable failure, is now considered quite within the range of possibility. The official reports of recent trials, even with a very crude and wasteful arrangement of the jets, show that the Water Witch does quite as well as the propeller. The London Engineer—the best authority—says that the results, bad as they are, have led to sanguine predictions as to the final success of the jet system or hydro-propulsion.

It may be interesting, in this connection, to state that hydro-propulsion is no new thing; a patent for propelling vessels by jets of water having been taken out in England as long ago as 1839, by Ruthven. Probably the first instance of its use was that recorded of Dr. Franklin, who, when a boy, "pumped" himself across a pond of water astride of an old wooden pump, working the handle as his propeller.

STILL ANOTHER NEW WHITEWASH.—Dr. Jacobsen, of Hamburg, has invented a new whitewash as durable as paint, and very beautiful. He dissolves 50 parts of glue in 150 parts of water. He then adds two parts of a solution of caustic soda, specific gravity 1.34, and boils. A flocculent precipitate separates, which may, however, be disregarded. When the above mixture has cooled, he adds fifty parts of commercial water-glass solution, and then stirs in enough oxide of zinc to give a proper consistency for painting. If necessary, the mixture must be passed through a mill to make it smooth. This composition, it is said, is well suited for either wood, metal or brickwork. Two coats should be laid on, and when they have perfectly dried, a solution containing ten per cent. of chloride of zinc should be applied. This will give a beautiful gloss, and great durability to the composition.

SHRINKAGE OF CASTINGS.—The shrinkage of the various kinds of metallic castings may be taken as, at least, a very close approximation as follows: Locomotive cylinders, 1-16 in. in a foot; in pipes,  $\frac{1}{8}$  in. in a foot; girders, beams, etc.,  $\frac{1}{8}$  in. in 15 inches; engine beams and connecting-rods,  $\frac{1}{8}$  in. in 16 inches; large cylinders, say 70 in. diameter, 10 ft. stroke, the contraction of diameter  $\frac{1}{8}$  in. at top and  $\frac{1}{8}$  in. at bottom; contraction of same in length,  $\frac{1}{8}$  in. in 16 inches. Shrinkage in thin brass,  $\frac{1}{8}$  in. in 9 inches; thick brass,  $\frac{1}{8}$  in. in 10 inches; zinc, 5-16 in. in a foot; lead, 5-16 in. in a foot; copper, 3-16 in. in a foot; bismuth, 5-32 in. in a foot; tin,  $\frac{1}{8}$  in. in a foot.

MALLEABLE IRON ORE (?)—It is stated in an Eastern exchange, that a Missouri blacksmith has prepared a horseshoe for the Paris Exposition made of raw ore from the Iron Mountain. Half the shoe is finished, and the other half shows the ore as it is dug from the mine.

THE INVENTORS of popular toys get quick returns. The inventor of the common street toy known as the "returning ball," is said to have realized \$100,000; the "always wound up top" realized \$40,000. The inventor of the "walking doll," which was so fashionable a few years ago, made \$75,000 by patent. The dancing "Jim Crow" toy, introduced a few years ago, was invented by an invalid boy, and won a fortune.

FOR THE KEARSARGE COUNTRY.—A party of about twenty or thirty Mexican miners are about to leave Virginia City for the new mines of Cerro Gordo, west of Camp Independence, in the Kearsarge country. They expect to put up furnaces to extract the silver from the ore. The ore found there is said to be very easily extracted.

## Scientific Miscellany.

SINGULAR ELECTRIC PHENOMENON.—Mr. Wm. F. Given, U. S. Vice Consul at Martinique, communicated the following very singular electrical phenomenon to the Smithsonian Institute, as having occurred at that place a short time previous. Just as a heavy thunder shower was about ceasing, a terrific report was heard, accompanied with a vivid flash, when it was found that the electric fluid had struck a house on one of the principal streets, throwing out a large portion of one of its walls into the street. The fluid then passed along several houses, and finally took a downward course to a point about three feet below the pavement, at which it turned, passed under the pavement without disturbing it, and came out through the gutter. At the point of exit, a large flat stone about a foot and a half long by ten inches wide and eight thick, was forced from its setting in mortar, and hurled upward, obliquely across the street, passing through a Venetian window blind and into the house, and fell upon a marble top table, which it shattered in pieces!

ACETYLENE—CURIOUS EXPERIMENTS.—A colorless gas, consisting of two equivalents each of carbon and hydrogen, is contained in small quantities in coal gas, and is supposed to have been the cause of certain mysterious and hitherto unaccountable gas explosions. It may be separated from the coal gas by passing the latter through a solution of ammonia-sulphate of copper, precipitating a reddish brown deposit of acetylide of copper. This being very explosive, igniting with slight friction, is supposed to have been the cause of several explosions which have occurred in moving copper gas pipes and in altering meters where the brass work had been much in contact with the gas, and a deposit of acetylide of copper might naturally have been formed. It is a curious fact that if chlorine gas is turned into a jar of acetylene gas even in darkness, an explosion will ensue; but not so if the acetylene be turned into the chlorine, unless a moderate degree of light be present. In the latter case, the chlorine unites with the hydrogen, setting the carbon free, so that the vessel, which previously held a mixture of colorless gases, is instantly filled with a mass of inky black smoke, giving the jar the appearance of patent leather. These observations are derived from a late lecture by Prof. Frankland.

VESSELS FOR HOLDING HYDROFLUORIC ACID.—The engraver on glass is often at a loss for utensils to hold his acid, but Stolba mentions that glass and porcelain vessels are protected from the action of hydrofluoric acid by a thin coating of paraffin, which is put on by carefully cleaning and heating the vessel and melting some paraffin in it, and moving it until the whole surface is covered, when the excess of paraffin is poured off. By this plan both lead and gutta serena vessels may be dispensed with.

A NEW OLEAGENOUS PRODUCT.—An Australian paper announces the recent discovery in that country of a new species of liquid gum or oil. It says: "A tract of land not less than ten miles square, has been discovered, which everywhere abounds with bubbling springs of gum or oil, while all around are vast quantities of the gum solidified into the consistency of india rubber." When exposed to a fire this substance, which is light, and floats in water, is said to burn with a bright flame, to be accompanied by a thick smoke, and a smell similar to old grease.

TEST FOR STARCH OR GRAPE SUGARS.—Picric acid, one of the derivatives of phenol, formed by the action of nitric acid on phenic acid, is of a yellow color. A few drops of a solution of picric acid in 250 parts of water is added to a solution of this kind of sugar (glucose) containing a little caustic soda, and heated to 90°. The mixture when boiled assumes a blood-red color, a result from the formation of picramic acid. A solution of cane sugar (sucrose), added to a solution of picric acid, does not produce this change of color.

THE musty smell which grain harvested in hot weather acquires, has been removed by Chalmel, by exposing it in the granaries to the influence of quicklime, (which however should not be allowed to come in contact with it), in the proportion of one part of lime to fifty of grain.

HYDROCARBONS FROM FISH.—The distinguished American chemists, Messrs. Warren & Storer, have obtained from menhaden oil, an animal fat contained in the species of herring, known as *Alosa Menhaden*, crude hydrocarbons, which on being rectified gave a product very closely resembling refined coal oil and petroleum in color, odor, and illuminating properties. The naphtha obtained from the crude product by Warren's process of fractional condensation has been subjected to repeated distillations. After nearly a year spent in experiments, they have separated sixteen bodies of constant boiling point, which were found to be hydrides of the higher alcohol radicals; and the more dense homologues of amylene and benzole. These investigations have an important bearing on the question of the origin of petroleum.

Menhaden oil is manufactured largely on Long Island. The fish from which it is made are taken in great abundance all along the sea coast of New England, from whence they have in years past been extensively shipped to the South for food for the negroes. They are also used in large quantities for manure. If we are not mistaken, the oil is considered valuable as a lubricator.

DETECTION OF MINUTE QUANTITIES OF MERCURY.—F. C. Schneider, in an essay "on the chemical and electrolytic behavior of mercury," states, that the slightest traces of this metal in solution, may be recognized by immersing in the liquid to be examined, the poles of a galvanic battery, both of which should be of gold. Upon the surface of the negative pole, a coating of gold amalgam is thus deposited, which is then to be removed to a test tube. This tube, after being hermetically sealed, is strongly heated, whereupon the mercury is sublimed, and collects in the further end of the tube. The addition of a crumb of iodine and gentle heat, is sufficient to produce the easily recognized red iodide of mercury.

THE SPIROMETER is the name of a newly invented instrument designed for measuring the volume of the breath—thereby being also an index of health and vigor. The practical application of this instrument, has shown a marked difference between persons in the habitual use of ardent spirits, and those who abstain therefrom, in their power of respiration. The instrument is now employed by life insurance companies in their examinations of applicants for policies.

A NEW GLAZE.—Common earthenware is glazed with a composition containing lead, on which account it is unfit for many pharmaceutical purposes. The following glaze has been proposed, among others, as a substitute: 100 parts of washed sand, 80 of purified potash, 10 of niter, and 20 of slacked lime; all well mixed, and heated in a black lead crucible, in a reverberatory furnace, till the mass flows into a clear glass. It is then reduced to powder. The goods to be slightly burnt, placed under water, and sprinkled with the glaze.

THE HARDNESS OF SILVER.—M. Mather, an assayer, has shown that the hardness of which carvers in silver sometimes complain, is not owing to the presence of tin, lead, or any other metal, but is solely due to the high temperature at which the silver is cast. By letting the crucible cool until a slight solid crust is formed on the surface of the fused metal, and casting at that moment, a soft silver with brilliant cut is obtained.

GLYCERINE is found to be an excellent material for smearing plaster of paris molds before taking a cast. It is easily applied with a brush, and after the cast has set, it readily separates without the least danger of splintering or cracking. It is said to possess many recommendations over the soap and water usually employed for the same purpose.

GRAPHITOIDAL BORON.—Wöhler has ascertained that this body, originally described by him as puro boron, is a definite compound, consisting of two equivalents of boron and one equivalent of the metal aluminum.

PRODUCTION OF ANILINE.—By adding to nitro-benzole an acid solution of chloride of tin, a strong reaction is obtained in a few moments, great heat is evolved and aniline is produced.

TOCCOLINA.—A bituminous substance, which is called toccolina, has been discovered in Italy. It is similar to our petroleum, and when refined, yields a burning fluid of excellent quality.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**PAINE & STEVENS' CONCENTRATOR.**—Messrs. Paine & Stevens, of Grass Valley, Nevada county, Cal., have made applications, through the agency of this office, for a patent for a concentrator and separator, which is quite novel in its construction and operation. Its chief characteristics, according to the representations which have been made to us, are, the amount of work it will do, and the trifling amount of power required to operate it. A machine capable of putting through from forty to fifty tons of pulp in twelve hours can be run, at its full speed, by the power of one man applied to a crank. Such a machine has been in actual work for several weeks upon the reservoir of tailings connected with the Star Spangled Banner mine and mill, near Nevada City. The amount of sulphurets saved per day, as per present working, is about one and a quarter tons, which assay \$150 per ton, to say nothing of a large amount of quicksilver and some free gold, which is also recovered—pretty good work for a single machine, which, when connected directly with a battery, would not require two hours' attention in twelve, and that merely to clean it up. The machine, as now constructed, is cleaned up by hand; but is capable of accommodating a ton or a ton and a half of sulphurets before cleaning up; and we can see no reason, from an examination of the model, why it might not be made self-discharging. The only one hitherto constructed is the one at work as above on a contract to concentrate the sulphurets from a reservoir containing about 1,500 tons of tailings, to which the mill is daily adding about 25 tons. The machinery is entirely different from anything of the kind with which we have heretofore met. It constitutes the principle of the "buddle" actuated by machinery. The receptacle which receives the sands and retains the sulphurets is stationary, and consists of a pan-like depression, sunk below the floor, from 17 to 24 feet in diameter, and about fourteen inches deep. The bottom is slightly inclined from the circumference to the center or discharge orifice. Through this orifice an upright revolving shaft is placed, and to which are affixed six distributing troughs, at equal intervals, reaching to the inner surface of the pan-like depression in the floor. The pulp is conveyed by a suitable stationary sluice from the battery or any other desired source of supply to a kind of hopper attached to the upright shaft, and from which it is fed into the six troughs aforesaid, which revolve with the shaft and discharge the pulp against the inner periphery of the pan. The bottom of the pan being inclined toward the center, the heavy particles have a tendency to remain where they fall, while the lighter portions move gradually toward the discharge orifice. This action of separation is facilitated by a large number of light drags, made of shortstrips of common canvas, attached to a set of revolving arms working upon the central shaft, in the same manner as the troughs already described. All the power required is to move this central shaft around slowly in its step. We are assured that the separation thus effected is very complete—a ring of a very few inches only of the mass which remains in the pan being mixed. This, on cleaning up, is shoveled out upon the platform and put through a second time. That portion which remains near the circumference being 95 per cent. sulphurets or more, while but a small fraction of one per cent. of sulphurets can be found in the sands, which go to waste. As the mass of sand and sulphurets accumulate in the pan, the circular wall of the outlet is made to rise automatically, more or less rapidly, according to the proportion of sulphurets to the mass of sand being put through the machine. The machine is exceedingly simple, is constructed of wood, with the exception of a few feet of gas-pipe and seven or eight hundred pounds of castings. It can be built by any carpenter. One machine, costing about \$1,400, is sufficient to concentrate the sand from 25 to 30 stamps. The above facts are, of course, *ex parte* evidence, as we have never seen the machine at work. The principle, however, as shown in the model, looks feasible. Large numbers of millmen from

Nevada and Grass Valley and vicinity have visited Nevada City to see it work. We hope soon to give an illustration of it, and facts with regard to its efficiency derived from disinterested parties.

**A NEW DITCHING MACHINE.**—The Santa Clara *Argus* has seen a ditching machine, the invention of Mr. J. P. Henning of that county, which it is thought will prove of great value to the farming interest, in the saving which it will make in the cost of fencing. The editor of the *Argus* has witnessed a trial of the machine, of which he speaks as follows: "Although a four horse machine, only two were hitched to it, and apparently with as much ease as they would draw an ordinary plow, at each trip over the ground, they cut a ditch twenty inches in width and two in depth, depositing the excavated earth at a distance of six feet to one side. Mr. Henning claims that four horses can draw this machine twelve miles in ten hours, cutting a ditch two feet wide and three inches deep, equal to one mile of ditch three feet deep, with an embankment of loose dirt two feet high on the top, thus making a five-foot fence around 640 acres in four days."

**A NOVEL MORTISING MACHINE.**—We have witnessed the working of a new and novel mortising machine, invented by Mr. John Cox, of Lane county, says the *Oregonian*. It would be difficult to describe the machine, though it is simple in construction. The power is applied by an oscillating lever and the mortising chisel works much upon the principle of an augur. It will do the work of about four men, or rather, one man can make a mortise of four inches in depth, perfect in outline and very smooth in surface, in about one-fourth the time required to bore and chisel it out. The probable cost of the machine will be about \$25. The great advantage secured by the machine is that a mortise can be made with it, in an upright post or a beam overhead, with equal facility.

**A NEW HAY PRESS.**—The *Visalia Delta* says that Mr. John McKearn has invented a new hay press, which he calls the "Horizontal Capstan Press." The machine looks substantial and powerful, and it will be thoroughly tested the present season. It has already been subjected to practical operation.

**A STEAM BEDBUG EXTERMINATOR.**—The *San Andreas Register* says that Mr. I. C. Green, of that place, has invented a steam bedbug exterminator, which consists of a sort of double tin coffee-pot shaped can with a furnace in the middle; the water is introduced into the can by a small opening at the top, which is then corked up, and in a few minutes after the fire is started the steam comes whistling from a long tube attached. The whole thing is about the size of a common coffee-pot, which can be taken by the handle and carried from room to room, and by means of the tube the steam can be introduced into every part of the bed and house without moving or disturbing anything in the house.

**A FIRE ESCAPE FOR TRAVELERS.**—In England, a portable fire escape has been introduced for the use of travelers, which is said to be as safe and easy to use as a stairway. Within a thin metallic case, seven and a half inches in diameter, are coiled on a pulley thirty feet of light, strong and flexible steel wire rope, passing out between rollers, which may be adjusted by a hand screw to any desired pressure, and terminating in a hook that can be fastened to a window seat. A chair formed of leather straps is attached to the case, and a person seated in the chair may regulate or arrest at pleasure the speed of his descent by means of the screw. This sort of fire-escape can be carried by any one in a portmanteau.

**AN IMPROVED STOVE.**—An Englishman is said to have invented a stove for burning solid fuel, which so consumes its own smoke and gases that it may be used even without a flue or chimney, as a kerosene stove is used; although, in actual practice, a small vent, consisting of a half-inch pipe, is employed to carry off the small residuums of gas. The effective principle of this stove consists in causing all the gaseous products of combustion to pass into a chamber filled with manufactured peat charcoal, which absorbs the carbonic acid and other gases, and burns with a very small supply of air until nearly or quite all the carbon is consumed. A half-inch pipe is found sufficient to carry off the excess of gas. Such an apparatus might be possible; but how can the imminent danger of explosions from the accumulation and sudden firing of gases be avoided? If the gases could be burned as fast as generated, all would be well; but otherwise, and alas!

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,  
JUNE 1, 1867.

## CITY STOCKS.

City Stocks continue dull of sale in the open market. We note transactions in National Ins. Co. at \$71 per share, Spring Valley Water Co. at \$67 per share, and California Steam Nav. Co. at 71½@70½ cent.

Considerable sales of Legal Tenders have been made at 73½@73¼c. At the close, 73½c was bid and 74c asked. June 7-30's sold during the week at 80¼c.

The sales of mining stocks, city shares, etc., in the Stock and Exchange Board during the month of May in the past four years, show the following aggregates: May, 1864, \$4,688,285; May, 1865, \$5,665,549; May, 1866, \$3,052,102; May, 1867, \$7,651,855. The transactions in the Board during the month just closed exceed those of any previous month since January, 1864, about \$2,000,000. Frequently during the past month the sales of a single stock amounted to more than \$100,000 in one day.

## MINING SHARE MARKET.

The Mining Stock Market has been exceedingly active, but nearly every share on the list has fluctuated materially, and at the close less firmness prevails than at the beginning of the week. Operations on the Comstock lode are rapidly augmenting, infusing life into companies that have been comparatively idle for a long time past. The aggregate product of the Washoe mines is rapidly increasing, and the yield has at no former period been so large as at present.

**SAVAGE**—sold to a limited extent during the past week, advancing from \$3,850 to \$3,950, seller 3, receding to \$3,850@3,900, and closing yesterday at \$3,875. The ore extracted from this company's mine during the week ending May 25th amounted to 2,136 tons, showing an approximate value of \$97,954, equal to \$45.55 per ton. Of this amount, the "mines" on the seventh level produced nearly all, the north mine yielding the largest amount—926 tons. It is stated that the ore taken from the breasts in the north and middle mine on the seventh level has been unusually good. The seam of ore found above the second station, mentioned in our last issue, still holds out, but is so difficult of access that it produces ore slowly. The general appearance of this mine continues in a very satisfactory condition. Both mills of this company are in excellent condition, and it is said reduced some 2,500 tons of ore during the month just closed—more than they have ever reduced in any previous like period.

**HALE & NORCROSS**—remains out of the market. We quote it nominally at \$3,500. Advice to the 27th of May state that they were opening both north and south of the "south raise" on the 700-foot level, and that these developments show a marked improvement in the quantity and quality of the ore. South of the raise they have cut east about ten feet, finding ore clear across to the east wall; north of the raise they went seven feet east, but had not yet reached the east wall. The ore delivered to the custom mills from the 1st to the 24th of May amounted to 2,812½ tons, 65 per cent. of which—the amount exacted from the mills—shows an average yield of \$123,133.67. On the 21st of May, the shaft was 371 feet in depth.

**CROWN POINT**—has been in the market to a larger extent than usual, selling, for the most part, within a range of \$1,800@1,750, then at \$1,690, and closing at \$1,595, seller 30. During the week ending May 24th, 549 tons of ore were extracted from the mine. The east vein, on the 500-foot level, is now developed—north and south—about 45 feet, and is said to be looking as well as when first opened. The west drift, same level, is in 147 feet. The shaft toward the 600-foot station is 36 feet in depth. The election of Trustees for the ensuing year takes place on Monday, the 3d inst. From the annual report of the Secretary of this company for the fiscal year ending April 30th, 1867, we make the following extracts:

RECEIPTS.	
Cash on hand May 1, 1866.....	\$ 69,930 81
Bullion.....	1,247,933 47
Other receipts.....	18,412 91
	\$1,336,272 22
DISBURSEMENTS.	
Dividends.....	\$372,000 00
Mining expense.....	260,834 85
Mining expense—company.....	1,434 37
Mining expense—outside mills.....	339,459 96
Legal expense.....	91,762 48
Mill improvement.....	85,378 38
Mine improvement.....	8,768 54
Salaries, office rents, etc.....	25,817 07
Taxes, assaying, etc.....	42,541 97
Cash in treasury, May 1, 1867.....	\$7,061 30
	\$1,336,312 22

There were 34,750 tons of ore reduced, making the average yield per ton for the en-

tire year \$35.91. The average cost of reduction has been as follows: 11,631 tons at Rhode Island mill, \$10 per ton; 1,460 tons at Crown Point mill, \$12.39; 21,513 tons at outside mills, \$14.97, and 146 tons of first-class ore, \$50 per ton. Total cost of mining 34,750 tons of ore, \$7.50 per ton. The Superintendent, in the course of his report, states that "the entire number of feet of drifts and cross-cuts run during the year aggregate 3,010 lineal feet, only 110 feet of which have been in ore."

**YELLOW JACKET**—advanced from \$1,775 to \$1,790, receded to \$1,700, seller 3, and closed yesterday at \$1,725. During the week ending May 20th, 1,671½ tons of second class ore were extracted from the mine. The hullion yield during the same period is stated at \$97,361.10, and added to the amount reported in our last issue, shows a product of \$163,672.46 from the 1st to the 20th of May.

**CHOLLAR POTOSI**—continues to be one of the most active stocks on the list, selling at \$607.50@615, declining to \$560, under large sales, then obtaining \$579@590, and closing at \$572.50. The yield of ore continues large, amounting to 3,609½ tons during the week ending May 25th, of which amount the Potosi mine produced 3,438 tons, and the new shaft 171½ tons. We have no material change to note in this mine since our last reference.

**GOULD & CURRY**—rose from \$565 to \$595, receded to \$570@560, and at the close sold at \$562.50. No estimate can be formed of the amount of ore in the upper chambers of this mine, but it is believed that about 50 tons per day can be extracted for the present. The hullion received at the office in this city during the month of May, aggregated \$74,862.68, a portion of which is the product of April. The mill has been running about twenty days in the month of May.

**KENTUCK**—has been quite active, opening at \$385, improving to \$409, dropping to \$370, rising to \$425, and closing at \$411. This company had a cash balance of \$99,917.07 in bank on the 24th of May. We learn that they extract at present about 70 tons of ore per day, showing an average assay value of \$55 per ton. They reduced about 2,000 tons of ore during the past month....ALPHA sold at \$450@411 per foot.

**OPHIR**—has been largely dealt in within a range of \$405@340, closing yesterday at \$320....BELCHER fell from \$415 to \$385, and closed at \$390....IMPERIAL opened at \$195@205, receded to \$190, advanced to \$195, and closed at \$199 bid. The third shipment of hullion of this company to the San Francisco office in the month of May, amounted to \$15,233....EMPIRE sold within a range of \$170@165....A few shares of GOLD HILL Q. M. & M. Co. sold at \$165.

**OVERMAN**—has been exceedingly active, about 1,000 feet changing hands within the past week, opening at \$65@70, receding to \$58, and closing at \$61. It is reported that a change in the management of this mine is the cause of the recent large sales under a very marked advance....CONFIDENCE declined from \$80 to \$65, and closed at \$68 bid....BULLION receded from \$35 to \$26.

**DANBY**—receded from \$27 to \$15, and closed yesterday at \$20. We are informed that this company is now taking out from 15 to 20 tons of ore per day, of an average value of about \$20 per ton. During the past week, \$4,126.49 in hullion have been received, and in February and April of the present year, \$4,244.90. From the past history of this company, we glean the following: From February, 1862 to March, 1865, this mine produced \$272,749.98 in hullion. There have been nineteen assessments levied since the organization of the company, amounting to \$224,000, and \$56,000 disbursed in the shape of dividends to its stockholders. The mill cost \$85,000, and lately an additional sum of \$8,000 has been expended upon it. The hoisting works and pump involved the expenditure of \$36,000.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,604,932.

**NEW INCORPORATIONS.**—Articles of Incorporation have recently been filed in the County Clerk's office in this city as follows:

Iowa Gold Mining Co., Amador county Cal. Capital stock, \$10,000; 100 shares. Trustees: Jno. F. McCauley, Wm. L. Higgins, Johnson Price, John R. Wilde and W. C. Parker. May 28th.

Winchester Gravel M. Co., Placer county. Capital stock, \$100,000; 100 shares. Trustees: Irwin McDowell, B. M. Hartshorne and W. H. Sears. May 21st.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

SOME of our exchanges are very irregular in their appearance upon our table, and those that are regular, seem to be more interested in politics and politicians than in recording the progress of our miners and others engaged in developing the vast resources of our State. Come, gentlemen, a little less politics, and a little more "local intelligence."

## CALIFORNIA.

## Alpine County.

From the *Miner*, May 25th: Several tests of rock found on the Tarshish croppings, have been made, yielding from \$7 to \$60 per ton. A new vein of rich ore has been struck. The frame of the new ore house is nearly completed.

## Amador County.

From the *Ledger*, May 25th: The Union mine is turning out better than it has for years; the ore is quite full of free gold.

The Grass Valley mine is being opened by tunnel from Grass Valley Creek. This company's Italian mine still continues to yield as regularly as clock work.

The Anaconda mine has been freed from water, and the main shaft has taken a rapid downward tendency.

The Golden Eagle, Fogus, & Co., still continues to yield excellent ore with unusually fine prospects ahead.

## Calaveras County.

From the *Chronicle*, May 25th: A New York company propose to sink a shaft on the Marlette claim near Middle Bar. The John P. Shear lead will be prospected this summer; ore from it has already yielded from \$8 to \$10 per ton. Several mills are at work at Angels crushing quartz. At Alta-ville W. H. Bovee with 15 arrastras, and 10 stamp batteries, is handling about 15 tons per day, and is yielding him, on an average, \$30 per ton.

The Mokelumne and Campo Seco Canal and Mining Co., have nearly finished the rebuilding of their works, and are making a survey for an extension to the newly discovered diggings at Cat Camp.

## Contra Costa County.

From the *Gazette*, May 25th: The mines now working and shipping coal are the Black Diamond, Union, Pittsburg, Independent and Eureka. The Mount Hope Co. have opened a mine in the vicinity of the Black Diamond.

## Fresno County.

From the *Mariposa Mail*, May 25th: R. H. Rogers, of San Francisco, is moving a 5-stamp mill from Clear Creek to the St. Patrick mine, Texas Flat. It is his intention to add five more stamps.

## Humboldt County.

From the *Yreka Union*, May 18th: At Mugginsville, Hollenback & Co's claim is paying well—about \$60 per day. Eastlick & Co. are cutting a new ditch to convey the water from Howard's mill to the diggings below Mugginsville. Shelly & Co. have good prospects.

At Deadwood, Knief & Co., Haley & Co., and Jasper & Co., are taking out more money than at any previous period during the last five years. Squire Steele has commenced work on the Steamboat claims. J. K. Luttrell, O. P. Goodale, L. Williams, J. W. Tuttle and others are preparing to prospect Patterson Creek. Goodale & Co. are working the surface diggings in the vicinity of Patterson Creek and are getting good pay.

## Mariposa County.

From the *Gazette*, May 25th: The owners of the Potts vein in Hunter's Valley have a new mill nearly completed and ready for the machinery, which will be put up in a few days. The mine still continues to yield excellent rock.

The Buena Vista Petroleum Co. have concluded to suspend operations until more satisfactory results can be obtained. The amount expended for machinery, etc. during the last year has been about \$5,000, outstanding indebtedness, \$1,400.

## Nevada County.

From the *Transcript* of May 23d: The Cunningham mine is looking first rate. A contract is to be let for running two drifts into the ledge, in order that rock may be more easily taken out.

The Eastern Co., at Hunt's Hill, at a distance of 500 ft. from the mouth of their tunnel, have a fine bed of blue cement. The clean-up each week amounts to from \$1,200 to \$1,500.

Same of 25th: Binsley & Co., at Kentucky Flat, took out two lumps of gold, one weighing \$53, the other \$45. Both

were as pure as though refined by fire. Specimens ranging from \$10 to \$30 are frequently taken from these claims.

Same of 26th: On the Homestead ledge, Myers' Ravine, the owners got in with the tunnel, striking the ledge 60 ft. below the surface. The lead is 3 ft. wide, and the rock is filled with rich sulphurets, in which the free gold can be seen. The opinion is that it will pay more than \$50 per ton. One hundred ft. in this claim was sold a day or two ago for \$500.

Considerable prospecting for quartz has been made in the vicinity of the Anthony House, Pleasant Valley, recently. Thompson & Co. have a promising lead several feet in thickness, upon which they have sunk a shaft 45 ft.

Same of 29th: The Eagle Co., at Relief Hill, have completed a head-rock tunnel 800 ft. in diameter and 115 ft. below the surface. This work cost \$14,000.

From the Grass Valley Union of May 21st: Rock from the Grass Valley Consolidated mine, on Union Hill, has thus far yielded from \$27 to \$31 per ton. The machinery for a 10-stamp mill, etc., has been purchased in San Francisco.

A. H. Houston sold, on Tuesday last, a 1/2 interest in the Houston Hill mine, and a 1-16 interest in the Orleans quartz mill, to J. A. Pierce, of Santa Clara, for \$22,000.

EXCELSIOR.—From the *Gazette* of May 23d: Work is now being done on four different parts of the Mohawk and Montreal mine. The tunnel on the third level is in a distance of 80 ft., from the end of which they intend to drift square for the ledge. It will tap the ledge upwards of 300 ft. from the surface. The rock in the shaft is looking better than ever.

From the *Transcript* of May 28th: The California Co. have sunk 100 ft. on their ledge, and run a drift some 30 ft. The ledge is 7 ft. wide, and presents an excellent appearance.

From the Meadow Lake Sun of May 25th: A new discovery has been made a short distance below the Excelsior, and located under the name of Green Emigrant. Its specimens, if anything, are richer than anything heretofore found in the district.

A fine prospect of free gold has been extracted from the Golden Eagle Co's claims. The rock from which it was taken is estimated to yield \$250 per ton.

## Placer County.

From the Nevada Gazette of May 29th: The new cement mill of King Bros., near Dutch Flat, is under way with its eight stamps, making each a drop a second.

From the Anburn Stars and Stripes of May 22: The Green Emigrant is constantly improving. The company have been much interrupted for want of water. They have not yet made a clean-up.

Mr. Linn has commenced operations on the Westchester mill. Claims on Bushy Cañon are looking up in the market.

Mr. Francis Clark, Supt. of a Washoe and San Francisco Co., has been prospecting between Michigan Bluff and the Middle Fork, near American Bar. Several ledges have been opened and satisfactorily tested. He will erect a 10-stamp mill.

VanArnsdale & Ray, at Deadman's Cañon, work 700 lbs. of rock per day with an arrastra, which yields \$18 per ton.

From the Dutch Flat Enquirer of May 29th: J. & A. Reistone & Co. have erected a mill on the Redstone lode, near Lost Camp.

M. J. Hydell, after expending \$25,000 and running a tunnel 1,000 ft., has at last struck a very rich streak of cement, from 7 to 10 ft. wide, reaching several feet up from the bedrock.

## Plumas County.

From the *National*, May 18th: Laufman & Co. have discovered a quartz ledge one-half mile west of the Mountain View, in Indian Valley, about three feet wide.

The New York Co. have made arrangements with Judkins & Co., of Round Valley, for water from their reservoir. They intend erecting a mill upon the ledge, and expect to have it running by the 1st of August.

At Mill Creek lately, Mr. C. Galkin picked up a \$40 slug. Mr. J. Ellis also picked up a slug of the value of \$53.

## Tulare County.

From the *Delta*, May 22d: The Long Tom Co. will soon suspend operations for some weeks for the purpose of putting in new machinery, etc. McFarlane, Tucker & Bro., Pile & Collins, and others, have lodes of undoubted richness. The mine of the McFarlanes at Howland Gulch, eight miles this side of Posey Flat, has been developed to some extent, by Andy McFarlane, and presents indication of immense richness.

## Yuba County.

From the *North Californian*, May 22d: The Babb claim at Timbuctoo, has turned out some cement which is literally spangled

with gold. At Bangor, a steam cement mill is in operation. H. G. Kendall has disposed of his mining interests to a San Francisco company, who will put up a cement mill as soon as the machinery can be manufactured. There are six or seven other claims being vigorously prosecuted.

## BRITISH COLUMBIA.

From the *Cariboo Sentinel* of May 6th: At Williams' creek, the Bradley-Nicholson Co. are making preparations to ground sluice their front ground as soon as they can get water. The Chinese Co. have been making from \$10 to two ozs. a day to the hand through the winter. The Taylor Co. are doing well. The Deadwood Co. are running a drain to tap the hill channel from the upper shaft of the Wide West Co.

The following companies have been at work all winter, with good success: Caledonia, Last Chance, Cameron, Prince of Wales, Rankin, Wide West, Henrietta and Forward.

The following companies, which have been at work all winter, have suspended, on account of water: Well Mary Ann, Brouse, Dutch Bill, Bailey, Steadman and Six-Toed Pete.

Started lately, and now at work: Burns Tunnel Co., Chippis, El Dorado, Diller, Bald Head, Bed Rock Drain, Welsh, Australian, Cariboo, Never Sweat, Nevada, Prairie Flower, Dead Broke and Casket. The Bed Rock Flume, Hit or Miss, Borealis and Jenny Lind Cos. expect to start soon.

The Forest Rose Co. worked the greater part of the winter with a rocker, and declared a dividend of \$140 to the share after paying the wages of 11 men.

At Stout's Gulch, the Floyd, Alturas and Jenkins Co's are at work.

At Lightning creek, the Blyth, Eastern, Welsh, Eureka and Ross are at work.

The Smith Co., at Antler creek, have been engaged running a tunnel all winter. They have got in 250 ft. The air in the tunnel is so bad that they are obliged to sink a shaft for ventilation.

The Anglo-American is the only company at work on Kitchley's creek.

Two companies are at work on Last Chance creek. The same number at Davis creek.

At Grouse creek, the Tiger, Heron, Blackhawk and Discovery Cos. are at work. The Heron Co. has declared dividends since they began work to the amount of \$17,000 per share. The Discovery Co. has declared a dividend of \$250 per share for last week's work.

At Conklin's Gulch, the Ericson, United, Home-Stake, and Hood Cos. are at work. The United Co., with a small head of water, last week washed up 472 ozs.

A discovery has been made in the Vigna and Cloggan, at North Wales. Three-quarters of a ton of ore yielded 62 ozs.

The Cariboo Co. washed up yesterday, as the result of 2 1/2 days' work, 92 1/2 ozs. They found a nugget, containing a little quartz, weighing 9 1/2 ozs. The Bald Head Co. also washed up yesterday 55 ozs.

## COLORADO.

From the *Deuver News* of May 8th: The Sukey Co. are driving a tunnel into Glacier mountain. It is in 160 ft. During the past month a shaft has been sunk 35 ft., developing a crevice 2 1/2 ft. wide of solid silver ore. The ore is so easily obtained that three men can take out enough to supply large works with all they can run.

The Bullion Co. are tunneling at the head of Clinton Gulch. Their shaft is 124 ft. deep. Clark & Chantler have their shaft 80 ft. deep. Christian & Hooper have their shaft 50 ft. deep. They have a well-defined crevice of 4 1/2 ft. in width. Mumford, Lawson & Co., after running a tunnel 47 ft., struck a well-defined crevice.

Reynolds & Co. sunk a shaft 30 ft. deep on the Colossus lode, in Galeana Gulch. Bunches of galena were taken out from the surface down.

Mr. John Collom intends to erect large smelting works at Montezuma the coming summer, to run on custom work.

Five mills are running in Gilpin county. The report of gold shipments show from \$20,000 to \$30,000 per week.

From 4,200 lbs. of Baker ore, treated at Krauss, Reese & Bruckner's Works, a silver brick was taken, valued at \$85.30; 2,000 lbs. of Crawford ore yielded \$65.40; 15,000 lbs. of Pewabic ore gave \$38.39; 600 lbs. of ore from the Square and Compass lode, Georgetown, weighs 207.62 ounces—value, \$218.50.

Charles P. Slade has purchased of W. H. Jones Nos. 5 and 6 west, on the American Flag lode, Nevada Dist., Gilpin county; consideration, \$5,000.

From the *Denver Register* of May 18th: This week the Gunnell Co. took out 105 ozs.; the Black Hawk, 195; the Smith & Parmelee, 95. The banks shipped as follows: Geo. T. Clark & Co., 319 ozs.; Rocky

Mountain National Bank, 200 ozs.; Warren Hussey & Co., 105 ozs. Total, 714 ozs., valued at \$15,000.

## IDAHO.

From the *Owyhee Avalanche* of May 11th: Mining has commenced in several places between Silver and Ruby creeks. It is probable that \$100,000 will be taken out in Owyhee this spring and summer. The mill, mine and property of the Ainsworth Co. is under the management of W. B. Crane. It is believed that the Surplus Oro Fino mine, with careful mining and assortment, will pay good dividends. It is in every respect identical in size and quality with the Oro Fino.

The Webfoot mill is now ready to crush ore, and is expected to commence in the early part of the week, on rock from the New York ledge.

The Oro Fino road will be ready for quartz teaming in a few days. After two weeks run, of a 5-stamp mill, on ore from the Elk-horn ledge, a clean-up was made, assayed value of which was \$8,300; amount of ore, 100 tons. This vein is from two to three feet wide.

Same of 18th: The mill of the New York and Owyhee Co. is undergoing repairs; it is expected to be in running order early in June.

The Flint Dist. is admitted to abound in quartz, rich in gold and silver. Rising Star ore has yielded from \$35 to \$171 per ton. Its ores will be practically tried by the common stamp and pan process, and by this including roasting after crushing and before amalgamating; by the Freiberg barrel process and the one of smelting and shipping in a concentrated mass—making four separate processes to be applied in the next few months.

The Iowa Co. has decided upon the Freiberg process as the one best adapted to work the ore. The Morning Star mill is ready for work. Labor has been commenced on the north extension of the Poorman. Placer mining is thoroughly inaugurated in Boise Basin. J. A. Pinney's claim, on Tuttle's Gulch, cleaned up \$1,500 for seven days' run, and Fox & Co., on Buena Vista Bar, \$3,000 for same time.

From the *Idaho World*, May 15th: The snow in Lemhi is too deep for general mining; a few rich spots have been found about Leesburg. Mr. David Elder, a pioneer miner, has just arrived from Lemhi; he thinks some \$4 a day diggings may be found, and perhaps a few rich pockets, but he has very little faith in that region.

Underwood & Whiting made a clean up Monday, after five days' run of their claim on Bonum Hill, and took out \$2,500; the claim of Kennelly & Co., gave a total of \$2,400 in the last clean up; Donnelly's claim also gave a rich yield a few days ago. The claims on Moore's Creek are paying well. The claims at Granite Creek are paying very rich, water is plenty, and miners are in high spirits and busily engaged.

## MEXICO.

The correspondent of the *Bulletin* of this city, writing from La Paz, Lower California, May 12th, says: The mines, except those of the Triunfo and Mexican Co., are doing little or nothing. The latter company are annually augmenting their shipments to Freiberg, and so far have been the only really successful company organized in this territory. The Triunfo Co., since the erection of their new mill, have been doing better, shipping about \$20,000 by each steamer. The Freiberg barrel process is still preferred to the California pans in this mill. The company have several mines; the one in which they are principally working, the Mendocena, is down to a depth of nearly 600 ft. The entire shaft is in good pay ore. Very little stoping has been done, and wherever the vein has been pierced by levels, the ore is continuous and abundant.

## MONTANA.

From the *Montana Post* of May 11th: The Boulder Ditch Co. own nearly a mile of the Montana Gulch property and 700 ft. in Gold Hill. They bring their water from Boulder creek. This they do by bringing the ditch to Confederate, 417 ft. above the level of the gulch, laying an immense reservoir down into the gulch and up the opposite hills to a height of 377 ft., and forcing water, by hydraulic pressure, through this into the ditch leading to their ground. For this they have purchased 1,700 ft. of 22-in. iron tubing, made of from No. 7 to 12 boiler iron, capable of conveying 1,100 inches of water under 60 ft. pressure. The tubing cost \$25,000 in St. Louis. It is in 16 ft. joints; a portion of the iron is 1/4-in. thick. It was tested in California under 600 ft. of pressure, and in St. Louis under 700 ft., without injury. Besides this, they have 1,100 ft. of smaller iron pipe for tapping the ditch for the hose and ground sluices. The company intend to put in a bed rock flume

and work out the gulch as they go. The cost of the ditch completed will be \$50,000. By the last of June the company expect to be at work. Their ground is known to be immensely rich.

Mining in Last Chance and Grizzly Gulches has fairly commenced. J. M. Vivion has constructed a flume across Last Chance Gulch 400 ft. in length, for the purpose of supplying water to the bar on the northeast side of the gulch.

Both the Yan Yan and Helena ditches are dry at present.

New York and Caro Gulches are getting quite lively. The claims are paying well.

The Esler Co. sent over 199½ lbs. of silver. The blowers broke down during the cupellation, but Mr. Doidsheemer brought the blacksmith's bellows into play and completed it. A scarcity of coal has impeded operations, but a supply will be on hand in a short time.

A clean-up of 202 ozs. was made at Turnley's mill, on last Friday, from Whitelatch Union ore.

A special dispatch in the Denver News, dated Lafayette, Indiana, April 9th, says: "Dr. Barber's party left for Montana today. Four ladies of the highest social standing accompanied the party, which has invested \$40,000. They have three quartz mills with 40 stamps, and expect to realize a round million this season. Those are the four staple articles needed just now—men, money, mills, and ladies. The first three are absolutely necessary; the latter, mighty convenient."

A correspondent at Salmon river writes: Nothing can be done in the way of mining until the first of June. On Camp creek, but one claim was working, paying 23 cents to the pan.

#### NEVADA.

From the *Enterprise* of May 21st: Mr. H. C. Toombs exhibited yesterday a bar of bullion from the Midas mine which weighed 89 ozs., was .897 fine, and valued at \$1,663.64. It was almost pure gold. The bar was the result of 36 tons of ore worked by an arrastra, and bore the assaying stamp of Ruhling & Co.

In the show-windows of Fred Schoeneman are to be seen some exceedingly rich specimens of gold-bearing quartz from Pine Grove. The samples were sent to this city by Mr. McCann, and are from the Wilson lead, the Midas, the Wheeler, the Hamilton, and the Imperial. All are of the same character, and appearance, and nearly equally rich in free gold, though one or two of the specimens are literally covered with spangles of gold.

#### Reese River.

From the *Reveille* of May 17th: The Keystone mill has been undergoing repairs. It is the intention of the Supt. to add two roasting furnaces and increase the capacity of the amalgamating department, which will give it 20 stamps perfect complement. The general rate for reducing chloride ore in this district is \$25 per ton.

Same of 20th: A statement of the reduction of 2,844 lbs. of ore from the Dosert Queen ledge, Reveille Dist., worked at the Parrott mill at Big Creek, shows, by assay, \$891.11; 80 per cent. deducted for expenses left \$623.50.

The mill of the Twin River Co., at the Murphy mine, has resumed work.

Same of 21st: A delightful cabinet specimen of mineral was obtained, a few days ago, from the Fuller mine, on Lander Hill, which is as beautiful as it is rare. It is a piece of ore about one inch and a half long, one inch and a quarter wide and three-quarters of an inch thick. On the upper face there is a laminar crystal of hromide, circular in form, and a little larger than the diameter of a dime. The crystal has many points, which radiate from a common center. On the two sides are little dots of rich ruby silver, which is regarded as a unique occurrence in mineral of this character.

From the *Silver Bend Reporter* of May 18th: The Orlando ledge, in Argentoreo Dist., is about 28 in. wide, and has its face laid bare for a length of 40 ft. to the depth of 7 ft., which exhibits a beautiful quality of ore. Assays of the ore give \$669 of silver per ton. The Antelope is a parallel vein to the Orlando, and looks finely.

In Empire Dist., Sine & Co. have about 50 tons of ore at the surface that is estimated will work from \$.00 to \$250 per ton. Specimens from the Jerusalem lode assay largely. A depth of 15 ft. has been sunk upon this ledge, and a number of strata of ore exposed. The mineral occurs in limestone similar to the mines of Hot Creek, Reveille and Milk Springs Dists. But few people are at present engaged at Empire.

Several wagon loads of ore have left Reveille Dist. for Austin, where the ore will be reduced. Three tons were from the Fisherman ledge, and was estimated would

yield \$500 per ton. The remainder was from the Indian Queen lode, and a ledge located by Mr. Emersly.

The Fisher vein, at Milk Springs Dist., is 6 ft. wide and of remarkable richness. The Germania has fine walls on either side and a body of good ore 5½ ft. thick. The company has forwarded a lot of ore to Austin for reduction. The result of the working has not yet transpired.

A piece of ore from the Oriental lode, Manhattan Dist., was assayed this week, and yielded at the rate of \$82.13, silver, per ton. The Oriental ledge is one recently located by Messrs. Quimley & Klink, is well defined, with smooth and perfect walls on either side, and of a thickness of 6 ft.

The Combination Co. will commence the work of excavation for the foundation of their 40-stamp mill the coming week. East Belmont is the site selected.

At Silver Peak, the Bradley ledge has a width of 10 ft. to the extreme depth sunk upon it—40 ft.—and the bulk of the ore found is galena, highly argentiferous. The Belmont ledge has been sunk upon to a depth of 70 ft. and of a uniform width of 12 feet. This ore is identical with that of most of the lodes in Palmotto Dist., and a small lot worked in the Rigby mill at San Antonio yielded \$156 to the ton.

Some singular looking ore has been deposited at the office of Bont & Stetefeldt for assay, which resembles rich antimonial silver. It was brought from the Morey Dist., from two ledges named American Eagle and Magnolia. Assays from pieces of the richest looking ore yielded \$761.47 silver per ton, while the assay of the mass gave at the rate of \$142.18. The richest mass of the queer ore contains 3¼ per cent. of silver.

From *Tresspass*, May 24th: The following is the assay of several tons of ore worked by the Knickerbocker Co., during the past winter: Storm King, \$295.44; Pleiades, \$268.20; North Star, \$139; Indianapolis, \$104.43; Crown, \$168. The Knickerbocker is not running at present.

In the Twin River Dist., the Murphy mill is hard at work. For the months of November and December, the mill crushed 626 tons of ore, averaging \$132.43 per ton. For the quarter ending March 31st, 1,161 tons were reduced, averaging \$84.18 per ton.

In Park Cañon, North Twin River Dist., the La Plata Co. is prosecuting work on their claims—the Twin Ophirs—with great success. This company recently purchased the 15-stamp mill belonging to the Confidence Co., which was situated in Yankee Blade, and have removed the same to Park Cañon—so we may soon expect to see large shipments of bullion from this quarter.

Considerable bullion is now being shipped from San Antonio Dist. The Rigby Bros. are at work upon the mines on Petaluma Hill.

In the Hot Creek Dist., the Merrimac and Indian Jim claims are the most thoroughly developed, and look well. These two companies have united for the purpose of prospecting the Indian Jim ledge, and they are now down a considerable depth. The prospect is good for the erection of a mill the present season upon these claims, as there is already a sufficient quantity of ore on the dump to supply a mill for a long time.

Ore has been hauled from Reveille Dist. to Austin, which yielded \$300 per ton. The Manhattan Dist., discovered last year, is said to have some splendid ledges, many of which are from 50 to 60 ft. wide.

In Mammoth Dist., there are two or three Eastern, and several private companies at work—all with flattering prospects.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From *Enterprise*, May 21st: The shaft in the Neagle and Corcoran mine, is down 160 ft.; the hoisting is done by means of a whim: They intend to sink 40 ft. further, when they will run a drift to the lead. At the depth of 83 ft. a drift was run into the lead and some very fair looking ore extracted. Samples obtained in this drift have assayed \$15, \$25, \$40 and as high as \$331 per ton. There is a pile of eight or ten tons of it lying near the shaft. There is but little trouble with water. The ledge when cut at the depth of 200 ft. will doubtless show still better ore.

Same of 22d: Three drifts are now being run from the engine shaft of the Gould & Curry mine—one east, one north and one south. The work of sinking is continued in the shaft. It is the intention to keep on sinking the main shaft until the west casing of the ledge is cut. In order to sink to so great a depth, heavier pumping apparatus than that now in use will be necessary; accordingly heavier machinery has been ordered and will be put up in the course of a month or six weeks.

Same of 23d: Work has been resumed on the Monte Cristo, a lead that cut quite a figure in 1860 and '61.

Same of 24th: The Occidental mine has yielded during the last 16 months, \$300,000, and is now paying \$20,000 per month. The claim contains 1,800 ft.; a tunnel taps the lead 400 ft. below the croppings, at a perpendicular depth of 300 ft. Ore has been extracted from the croppings to the depth of 100 ft. for a distance of 600 ft. along the ledge, northward from the incline leading down from the outcrop to the tunnel. There yet remains, north of the incline and above the tunnel, a body of ore 300 ft. in height and 600 ft. in length. South of the incline lies untouched an immense sheet of ore, reaching up from the tunnel to the croppings—400 ft.—and extending south to an unknown distance. The lead is about 40 ft. in width and the pay stratum has an average width of about 12 ft., yielding ore averaging \$25 per ton. Quite a lengthy account of this mine was given on page 162 of this volume, and in previous numbers.

Same of 25th: During the past week, Wells, Fargo & Co. have shipped from this city and Gold Hill over 8½ tons of silver bullion, worth \$536,770.40.

From *Tresspass*, May 23d: The Hoosier State mill is again in motion, greatly enlarged. Its former capacity is 15 tons per day; but the improvements render it a 40-ton mill. Its present machinery is as follows: The motive power is an engine of 80-horse power, 14 in. cylinder and 20 in. stroke of piston rod, which runs 18 stamps, 27 pans (including four new Greely pans), three agitators and two 7½ ft. settlers. Fourteen vats for settling and slum, and a corral for tailings, render certain the securing of all the precious metals in the ore. The work has been done by the contractor, Frank Denver. The mill is owned by Clark & Lynch, and will work Chollar ore.

The Marysville *Appeal* says the machinists at the Marysville Foundry are putting the finishing touches upon two steam engines of 120-horse power, for hoisting at the Yellow Jacket mine, Gold Hill, Nevada. These engines are connected by one shaft, and run by "link-motion," which is necessary for hoisting out of shafts over 1,200 ft. deep. It is estimated that these engines will hoist a car with safety from a depth of 3,000 ft.

#### UTAH.

From the Salt Lake *Vedette* of May 18th: We were yesterday shown the result of 15 pans' washing from the placer diggings in Bingham county. An old California miner says that in all the dry gulches and hill-sides may be seen evidences of the existence of gold, which will yield from the color to 30 cts. per pan. He thinks that if water is turned in, good \$10 diggings will be found.

The Rush Valley mines, Tooele county, are as yet comparatively undeveloped. A large amount of money has been expended in experimenting on furnaces and apparatus for working ores. Messrs. Storck & Wehereing, from Germany, are now erecting and have been successfully working their cupel or blast furnaces.

Shafts have been sunk on the Silver King lode 165 ft., and a tunnel run into the lode at another point 140 ft., from which great masses of ore have been taken. Messrs. Chase & Paxton are sinking a shaft on the Quandary lode to the depth of 75 ft. Assays by Storck & Wehereing prove the richness of that lode. Native silver was shown to us in ore of the Hard Times lode and very rich ores from many others; and it is only a question of time when an immense quantity of silver and lead will be shipped from these mines.

**MINERAL SPRING WATERS.**—The fabrication of the most celebrated German and French mineral spring waters has recently been commenced at No. 529 Jackson street.

Modern chemical research has accomplished the problem of a close imitation of the waters taken from the natural springs, both in their elements and medicinal effects. Kissinger, Vichy and Selters have already been introduced to the public, and have been favorably received.

**BLACK DIAMONDS.**—The diamonds used for the "Annular Drill" are the black Siberian variety, said to be much the hardest of all the diamonds, though least valuable as gems. The drill, as now constructed, advances about three-quarters of an inch per minute, however hard the rock may be.

**MONEY FROM THE MINES.**—The Gould & Curry, during the past six years, has yielded, in round numbers, 220,000 tons of ore, averaging \$59 per ton, or a total of \$13,627,000. This is at the rate of about \$2,270 a day.

## Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

### REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is so acuter entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

### Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA.  
San Francisco, May 24, 1866.  
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way merit our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.  
We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITTREGE & LEAVITT,  
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.  
I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SMITH,  
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.  
I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st.—Because it is impossible for either burglar or expert to pick it.
- 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.  
Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1867.  
The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any burglar gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.  
Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described of length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We remark an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1866.]

They are the only SAFE LOCK ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained; presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 320 in Pacific Coast Directory.]  
A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1866.  
Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon, Dec. 1, 1865.  
Mr. D. E. Smith is a duly authorized Agent for this paper, February 25, 1867.

## Notices to Correspondents.

W. M.—Money, or coin, was not made until a comparatively late period of the world's history; and it is supposed that it was first cast in molds—not stamped with dies. Thus we learn from Herodotus that prior to either of the modes named being adopted, "the gold and silver were melted, and poured into earthen vessels, and these, when filled, were removed, leaving the metal in a solid mass. When any was wanting, a piece was broken off of the vase required for the occasion." This was probably about 500 years before the Christian era. Some time about this period the same author relates the following anecdote about Croesus, King of Lydia, whose name has been proverbially associated with riches: "When Croesus sent his Lydians from Sardis to consult the oracle of Delphi, they were received with hospitality by the family of the Alcemæonides, at Athens, and, on their return, acquainted their master with the kindness they had experienced. A member of that family received an invitation to visit Croesus, and, on his arrival, was presented with as much gold as he could carry. To improve the value of the gift, Alcemæon made use of the following artifice: Providing himself with a large tunic, in which were many folds, and with the most capacious buskins he could procure, he followed his guide to the royal treasury. Then, rolling himself amongst the golden ingots, he first stuffed his buskins as full of gold as he possibly could; he then filled all the folds of his robe, his hair, and even his mouth, with gold dust. This done, with extreme difficulty he staggered from the place, his swelled mouth and projections resembling anything rather than a man. When Croesus saw him, he burst into laughter, and not only suffered him to carry away all he had got, but added to it other presents equally valuable." From this story we learn the fact that the wealth of Croesus was principally in gold as found in nature.

YOUNG MECHANIC, Grass Valley.—The prize of \$1,000 offered for the best treatise on the resources of California, mineral, agricultural, mechanical and mercantile, and the most economical and judicious advancement of their development, which has been announced as having been offered by the Mechanics' Institute of San Francisco, has not, as far as we are yet informed, advanced further than the crude idea. At least, so far as we can learn, no announcement has yet been publicly made as to the conditions which competitors will have to observe, nor the principal topics which it is proposed should form the chief heads of their discourse. Nor are we aware that any selection has yet been made of the parties whom it is proposed should adjudicate upon the respective merits of the various productions that may be submitted to them in order to obtain the prize offered. Either branch of the preliminaries just noticed is of great importance. It is also a matter of primary consequence that the conditions alluded to should be announced not only as speedily, but also as early as possible, so that the greatest possible number of available competitors may thereby be enabled to avail themselves of this opportunity for distinguishing themselves, not only as regards the utmost space over which they may reach, but also in order that they may possess the greatest amount of available time in order to perfect their observations and labors.

## The Pacific Oil Works.

The large oil mill which has recently been put into operation on King street, near the foot of Third, is one of the most perfect works of the kind in any part of the world. No effort or expense has been spared to make it, what it really is, a perfect success.

## THE EXTRACTION OF VEGETABLE OILS

From seed, especially the extraction and manufacture of linseed oil, simple as it may appear to the casual observer, is nevertheless an art that is thoroughly understood but by a few even of those who are actually engaged in the business. Until a comparatively recent date, the extraction and after manipulation of this oil has been done in a very rude, slipshod manner, with very little care for or knowledge of the rationale of the process. It would require many columns to give a detail of the successive improvements, in the way of machinery and manipulation, which have brought this important branch of manufacture to its present high standard. Suffice it to say, that nothing in past experience has been neglected in the construction of the works in this city, while much that is quite novel and important has been introduced here, for the first time.

Mr. P. B. Bruner, the constructing engineer and present managing superintendent of the works, has obtained a thorough education in the business in one of the first class establishments of this kind in America, to which he has since added, by observation, a complete knowledge of the business in Europe.

The engine, from which the power for driving the machinery is derived, and the boilers which furnish steam for the motive power, and for the heating and hoiling operations, are considered equal to any in the city. Every part of the works has been constructed with the most scrupulous care for perfection in the various processes, and economy of time and labor in handling material. The works are designed for expressing the oil from all kinds of seed which may be presented in sufficient quantity, or which may furnish a sufficiently valuable commercial product.

## OIL FROM MUSTARD SEED.

The machinery was first started on mustard seed, some 150 tons of which were put through in two lots of seed, one black and the other white. The white seed yields more oil and of a lighter color, than the black—in proportion of about 36 parts of the former to 28 of the latter. The actual result of the two lots was ten pounds of oil to a bushel or fifty-six pounds of seed. In working for oil alone, the seed is pressed warm; but in working to obtain mustard for table use, the oil is expressed cold. The cold process was used in the above case, the residual cake being taken by two of our enterprising spice manufacturers—Messrs. H. C. Hudson & Co., and Mr. Charles Bernard—by whom it is being prepared for the table. It constitutes a most excellent article for that purpose, and altogether superior to any which can be imported. Mustard seed oil is of a reddish-brown color, heavy body, and nearly odorless. That from the white seed is much lighter in color, than that from the black. This fact, and the great difference in favor of the white in point of yield, would seem to indicate that the white should be cultivated in preference to the black. This oil can be applied to a great variety of purposes—such as oiling wool in the process of manufacture, the lubrication of machinery, the manufacture of soap, for medicine, and for culinary purposes. For the latter it is fully equal to lard, for all uses to which that description of fat is applied. It also makes a most excellent salad oil. There is no limit to the demand for this oil. It is worth, in this market, from \$1.50 to \$2.00 per gallon.

Mustard grows in great profusion and to great perfection in this State. Its collection from the vast plains where it grows wild, might be made a most profitable business; and the establishment of these works hav-

ing furnished a reliable market, it will doubtless soon assume considerable importance among our agricultural productions. The seed is worth from 1½ to 3 cents per pound, depending, as will be inferred from what has been said, upon its character, whether white, black, or mixed, and also upon the manner in which it is cleaned.

## THE PRODUCTION OF CASTOR OIL

Is another proposed branch of the business of this establishment. The plant producing this oil has been known from the earliest period of history. The Egyptians were well acquainted with both the seed and the oil. It is spoken of by Herodotus, and was used as a medicine by Hippocrates. The nature and medicinal character of this oil is so well known to our readers that we will refrain from calling up any reminiscences on that point. Castor oil forms the connecting link between the drying and non-drying oils. In addition to its use as a medicine, it is used, in some places, for illuminating purposes, and is also largely employed as a lubricator. It is held to be the very best oil attainable for the latter purpose, as it never gums, while it possesses a body found in no other oil, animal or vegetable. This fact becomes apparent on heating it in a retort. When so heated as to distil over one-third of its bulk, the remainder is a thick, heavy mass, which becomes solid at the ordinary summer temperature of the atmosphere, having a yellow porous appearance, resembling caoutchouc. The Chinese have a mode of refining this oil so as to deprive it of its medicinal properties, and render it suitable for culinary purposes. The seed yields about one gallon of oil to the bushel, which is worth in this market about two dollars. The cake residue is worth but little, except as a fertilizer. The castor bean is extensively cultivated in the vicinity of St. Louis, Mo. Something like 150,000 gallons are annually imported into Great Britain. The plant flourishes with the greatest luxuriance in this State, and might be made a most important item in the product of nearly every farm. It might be raised to great profit, especially when the crop can be gathered by children, or by Chinese labor. The Pacific oil Mills will afford a regular market for all the castor beans that can be raised, at from three to five cents per pound—a price amply remunerative for their production, even at the cost of high-priced labor.

The chief purpose of these works, however, is the

## PRODUCTION OF LINSEED OIL,

Which is so largely used in the manufacture of paints, varnishes, and printers' ink. This is the most important, and by far the most extensively used of all the vegetable oils. It is obtained from the seed of the common flax, which is also so useful for the very superior fiber which it produces, and from which the linen of commerce is manufactured. This plant is easily raised in nearly all temperate latitudes. The climate of California is especially favorable for its cultivation, although it may not possess quite so good natural advantages for the preparation of the fiber. What is lacking in the one, however, is more than counterbalanced in the other. At the present price of the seed, and taking into account the peculiar adaptiveness of this climate for its culture, it must be a much more profitable crop than either wheat or barley; while the home market alone will reach to fully half a million of dollars annually, to say nothing for its demand for export. The company is offering four to four and a half cents per pound for the seed.

## THE PROCESS OF MANUFACTURE.

Each of the above oil-producing seeds, as well as several others of less importance, requires essentially the same treatment and the same machinery in the preparation of their products for the market. The first process is one of maceration, which is done by passing the seed between sets of rollers so gauged as just to mash the seeds and start the pulp from the hulls or shell. The mass is then ready for the next operation, which is a grinding process, and is performed by passing it under heavy grinding or miller stones, working like the wheels of Chil quartz mills, only upon a platform slightly inclined outward in every direction from the center, instead of in a trough. The stones employed are very large and heavy—measuring about seven feet in diameter and weighing nearly eight tons each. This great weight is required in order to thoroughly break down the little cells which contain the oil, so that it may be more readily expressed. The mashed pulp is fed through a hopper into the center of the bed on which the stones work, and passing outward, underneath them, lodges upon a circular bed or table, from which it is brought

round, by scrapers, to a proper receptacle, whence it is moved, almost automatically, into a gauge box, and from thence, by convenient and rapid manipulation, dropped into a mold placed between a fold of heavy canvas and upon corrugated iron plates, upon which it is transferred to a powerful hydraulic press, where it is subjected to a gradually increasing pressure up to about 600 pounds to the square inch. There are three of these presses, each receiving sixteen molds. The presses are worked by two hydraulic pumps of superior construction and driven by the engine.

When the cake comes out of the presses it is so hard as to be broken with difficulty by the hand. It is first stacked up in piles, as roofing slate is often piled, and subsequently ground up into cake meal as feed for horses and cattle, in which condition it much resembles coarse bran. The oil drips from the molds in the presses into vessels, from which it is conveyed by pipes into large receiving vats, from which it is subsequently pumped into boilers for its final preparation for the market. The present capacity of the mill is equal to a consumption of over 600 bushels of flaxseed per each twenty-four hours of running time, or its equivalent in either mustard or castor beans. This is equal to something over 200,000 bushels per year. The building and power is sufficient for doubling this capacity, at small expense, whenever occasion may require. All seeds of home production are purchased by the company as fast as offered, and at prices already named; but of course, for the present, they are dependent mainly upon foreign markets for their chief supply.

For a further description of these works, and a notice of some of the improvements introduced, we must refer to our next issue.

FACTS ABOUT PATENTS.—We commence, with the present issue, the re-publication of a very valuable series of articles on Patent Matters, written in 1863, for the *Prairie Farmer*, by W. E. Dodge, Esq., of Washington, and formerly an Examiner in the Patent Office. We trust our readers generally will peruse these articles with attention. There is a general lack of information on the subject of patent matters which should be supplied, and a kind of mystery surrounding them which should be thrown aside. Some of our most valuable improvements have been made by ordinary mechanics, ignorant of their real value, who have been swindled out of the just rewards of their genius by unprincipled men who have subsequently taken up their ideas, perhaps slightly changed or modified them, and eventually patented them as their own, while the real inventor has got nothing for his trouble. These things are generally the result of a lack of familiarity among mechanics generally with the nature of our patent laws, and the manner in which inventors may obtain the benefits which those laws are designed to convey.

These articles contain a few plain and simple directions, by which any person of ordinary intelligence will be enabled to know when he has made an invention and how to proceed to obtain the necessary protection provided therefor by the national patent laws.

In order to give the reader some idea, in advance, of the value and character of the articles which we purpose to reprint, we append a brief synopsis of the subjects which will be considered: What is a Patent? History of our Patent Office; The Object and Operations of Patent Laws; What may be Patented; How to Obtain a Patent; The Preparation of the Case; Examinations, Appeals, etc.; Some of the Evils Connected with the Patent Office; The Necessity of the Employment of Competent and Honest Agents, etc.

THE MEDALS.—We had the pleasure, a few days since, of examining, at the shop of W. E. Goldsmith, No. 505 Montgomery street, the beautiful gold, silver and bronze medals which were awarded, on Thursday evening last, to such boys at the Lincoln school as had reached the standard of merit required for such distinction. These medals were made by Mr. Goldsmith, and are done in the highest style of the art. Thirteen medals were awarded—one of gold, eight of silver, and four of bronze, besides seventeen diplomas. Charles W. Northrup was the recipient of the gold medal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. E. Eckart's Balance Valve for Stationary Engines, Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, P.e, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wakie's pans, Beers' pan, German Barrels, Aratra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.  
24v12 **H. J. BOOTH & CO.**

**Machinists and Foundries.**  
**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF  
**MACHINERY.**  
**STEAM ENGINES AND QUARTZ MILLS.**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing,**  
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

**WHEELER & RANDALL'S**  
**NEW GRINDER AND AMALGAMATOR**  
HEPBURN & PETERSON'S  
**AMALGAMATOR AND SEPARATOR,**  
**Tyler's Improved Water Wheel,**  
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.

**KNOX'S AMALGAMATORS,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either Gold or Silver Ores.  
**Genuine White Iron Stamp Shoes and Dies**

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ore, or saving either gold or silver.

**WILLAMETTE IRON WORKS,**  
PORTLAND, OREGON.  
**Steam Engines, Boilers,**  
**SAW AND CRIST MILLS,**  
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.  
Corner North-Front and E streets,  
18v13-ly One block north of Couch's Wharf.

**UNION IRON WORKS,**  
Sacramento.

**WILLIAMS, ROOT & NEILSON,**  
MANUFACTURERS OF  
CROSS' PATENT BOILER FEEDER,  
**STEAM ENGINES, BOILERS,**  
And all kinds of Mining Machinery.  
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.  
**Dunbar's Patent Self-Adjusting Steam Piston**  
**PACKING**, for new and old Cylinders, manufactured to order.  
Front Street, between N and O streets,  
14v11 SACRAMENTO CITY

J. MARSHALL. **GLASGOW** W. WYLLIE.

MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.  
Special attention paid to Repairing. 25 qy-3

**SAN FRANCISCO**  
**Foundry and Machine Works,**  
N. E. Cor. Fremont and Mission streets,  
Manufacturers of  
**Marine and Stationary Engines**  
Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc.  
—ALSO—  
Wine, Cider, Cotton and Tobacco Presses of the latest Improved Patterns.  
**STEAM ENGINES AND BOILERS,**  
Of all sizes, constantly on hand; Quartz Mill Shoes and Dies warranted to be made of the best white iron.  
**Dunbar's Improved Self-Adjusting Piston-Packing**, requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

**MACHINERY, OF ALL DESCRIPTIONS**  
Bought, sold, or exchanged. Bolt Cutting and Castings at the lowest market rates.  
6v11-ly **DEVOE, DINSMORE & CO**

**GLOBE**  
**Foundry and Machine Shop,**  
STOCKTON, CAL.  
**KEEP, BLAKE & CO.,**  
MANUFACTURERS OF

**Quartz, Saw and Grist Mill Irons, Steam**  
**Engines, Horse Powers,**  
Mining and Irrigating Pumps, Car Wheels, Derricks Irons, House Fronts, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited  
18v13-ly and promptly executed.

LEWIS COFFEY. J. S. HEDDON.  
**LEWIS COFFEY & HEDDON,**  
**Steam Boiler & Sheet Iron Works.**

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for new Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

**CALIFORNIA BRASS FOUNDRY.**  
No. 125 First street, opposite Minna,  
SAN FRANCISCO.  
ALL KINDS OF Brass, Composition, Zinc, and Babbitt Metal Castings. Brass Ship Work of all kinds, Spikes, Sheathing, Valve Rudder Braces, Hinges, Ship and Steamboat Belts and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and those Couplings and Connections of all sizes and patterns, furnished with dispatch.  
PRICES MODERATE.  
V. KINGWELL. 18v13-ly J. H. WEED.

J. O. HANSCOM. H. S. SMITH. **HANSCOM & CO.,** 17 FENDERSST. W. W. HANSCOM.  
**Etna Iron Works!**  
Southeast corner Fremont and Tehama streets,

**Practical Machinists and Iron Founders,**  
MANUFACTURE  
**STEAM ENGINES,**  
QUARTZ MILL MACHINERY OF ALL KINDS,  
**SAW MILLS, FLOUR MILLS,**  
**Dunbar's Improved Self-Adjusting**  
**PISTON PACKING,**  
Now so extensively used in the East and in this State. Requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

**HANSCOM'S CRUSHER.**  
The best of the kind now in use in this State or anywhere else.  
**Wheeler & Randall's New Grinder and**  
**Amalgamator,**  
Which only needs examination to be appreciated.  
**Tyler's Improved Water Wheel,**  
Giving greater power, at lower cost, than any wheel in use. Send for one of our circulars, giving full tables.  
All Wheels warranted to give the power as set forth, or the money will be refunded.  
**Sole makers for this coast of the "Pendergast**  
**White Iron Stamp Shoes and Dies.**  
None genuine unless obtained from us. Every one warranted.  
Patented Machinery of all kinds will be furnished by us at market prices. Particular attention given to drawings and specifications of machinery, which will be made to order. The patronage of the public is respectfully solicited.

And all kinds of  
**HIGH PRESSURE**  
**Steam Boilers**  
MADE  
All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense.  
All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.  
**Old Boilers Repaired**  
**D. CAMERON.**  
6v12-ly

**A NEW ENTERPRISE.**—The Folsom Telegraph notices the establishment at Folsom of a manufactory for slate paint and roofing—a new material now being extensively used by the Pacific Railroad Company for painting the roofs of cars, depots and bridges. This paint is made from slate rock, which is ground and then mixed to the required consistency with coal tar. This paint is said to be impervious to water, and improves, and is rendered almost indestructible by the ordinary heat of the sun. For roofing purposes it is said to be far superior to shingles, tin or slate. It is laid on roof-felting, for roofing purposes with a trowel, the same as mortar is ordinarily used, and of about the same consistency, about a half or an inch thick, and can be laid on as thick as may be required, thus forming a perfectly smooth surface; it soon dries and hardens with the heat of the sun and the atmosphere, and the older it gets the harder, and in fact, through the action of the elements becomes perfect stone.

**MINING EXPLOSIONS** are rare in this country, from the very limited number and depth of bituminous coal workings. The late explosion in the Clover Hill mines, Chesterfield, Va., is, however, a sad warning, and proves that stringent regulations and improved safeguards are matters of deep interest in this hemisphere as well as the other. Our bituminous coal beds are of vast extent, and destined yet to be extensively worked as the coal fields of Europe. It seems, in this instance, that gross neglect of both rules and specific orders caused an inexcusable calamity, by which sixty-nine persons were cruelly put to death. The removal of the door that closed a disused gallery, and neglect of an order to replace it, and a further neglect on the fatal day to make the regular examination for dangerous gas at the same place, were the conditions naturally leading to the possibility of a disaster which might otherwise have been prevented.

It is stated that although more than three months have elapsed since the explosion of the Oaks Colliery in England, little progress has yet been made in extinguishing the body of fire raging at the bottom. All the shafts have been sealed up.

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.  
25v12-3m

**TO KEEP HAMS.**—It is said that hams may be most perfectly kept in the following manner: As soon as the hams are thoroughly smoked, cut them up into thin slices, remove the bone, partly fry, as if for the table, then pack the slices in a stone jar, pour on the melted grease and as much lard as is needed to cover it all, and set away in a cool, dark place. Only one thing will disturb it. It will be so handy to put on the table that the cook will be likely to make frequent calls.

**MINERALS IN UTAH.**—Utah is thought to be very rich in minerals, and from them her people expect valuable returns. The Salt Lake *Vedette*, speaking of its immense lead mines, recommends the establishment of manufactories for sheet lead, lead pipe, shot, etc. The lead discovered is rich in silver.

Orders will be received at the office only for Chemicals of every description, which will be manufactured as may be required. The Company has to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed.

## BLAKE'S PATENT QUARTZ CRUSHER.

**CAUTION!**  
The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1886.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER, Agents for the Pacific Coast.

was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin,  
to the Secretary, at his office, No. 318 California street, San  
Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the twenty-eighth day of June, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the fifteenth day of July, 1887, to pay  
the delinquent assessment, together with costs of advertis-  
ing and expenses of sale. By order of the Board of Trust-  
ees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. jel

Office, No. 529 Clay street, San Francisco, Cal. my25

## Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice.—The Annual Meeting of the stockholders of the above Company, for the purpose of electing Trustees, and transacting other necessary business, will be held at the office of the Company, No. 5 Government House, San Francisco, on the SIXTH DAY OF JUNE, 1867, at 3 o'clock P. M. of that day.

J. M. BUFFINGTON, Secretary.  
San Francisco, May 14, 1867. my18

## Lady Franklin Gold and Silver Mining Company, Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1867, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.  
Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. my4

## Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of May, 1867, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 5 Government House, corner of Sansome and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventh day of June, 1867, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-second day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.  
Office, No. 5 Government House, corner of Washington and Sansome streets. my11

## Mount Davidson Gold and Silver Mining Company, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. PARDO, Secretary.  
Office, 141 Sutter street, San Francisco, Cal. my25

## Nuestra Senora de Guadalupe Silver Mining Company, Tayoltita, San Dimas District, Durango, Mexico.

The public is herewith cautioned against buying or negotiating the following described Certificates of Stock in said Company, to wit: Issued to H. Brucings, No. 96, 5 shares; to Wm. Geimann, Nos. 105, 107 and 108, each 10 shares; and Nos. 55, 109, 110, 111, 112, 113, each 5 shares; to Chas. Schunacher, No. 47, 5 shares; and No. 61, 15 shares; and to La Abra Silver Mining Company (New York) No. 156, 550 shares, as said stock has been sold for delinquent assessment (No. 26) at public auction, on Wednesday, May 15th, 1867.

E. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco. my18

## Nuestra Senora de Guadalupe Silver Mining Company, Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

**Is the Cheapest and Quickest Pan**  
Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Millers' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v14t

VARNEY'S  
PATENT AMALGAMATOR.

**These Machines Stand Unrivaled.**

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

**This Amalgamator Operates as Follows:**

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular way between the grinding surfaces and the quicksilver, and the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with the quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco. 1v1

HUNTER'S  
Eureka Amalgamator!

**FOR WORKING THE SANDS AS THEY PASS FROM** the battery. The coarse particles of sand are reduced to pass through a No. 6 screen that would pass through a No. 5 in the battery; the fine four gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The machine is four feet eight inches square on the bottom, and covered with iron dies 1 1/2 inches thick by four inches wide, extending across the bottom. With alternate strips of wood on end of the same width. The rubbers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between rubbers. The box is also lined with copper plates. The machine is set in operation by eccentricity giving an oscillating motion; and the rubbers are suspended on iron hangers, and adjusted by set screws.

One-fourth of a horse-power is sufficient to run one machine of ten tons capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from W. M. WATTS, Esq., of the Eureka Mill, will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is from rock that pays \$30 per ton. I am highly pleased with it, and think it is the best machine after blankets or plates I have ever seen. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it, but the best recommendation I can give it is that I want four more. Will you please go to the Vulcan Foundry and order them. Will you please go to the Pittsburg Company at Nevada City."

The price for a machine with rubbers made, and dies and wood set in the bottom, and all the iron complete, is \$275. The weight is about one ton with cast iron box; but to save freight, the box can be made of boiler iron, saving 500 pounds weight.

Orders sent to the Vulcan Foundry, the Union Foundry, or the Fulton Foundry, First street, will be promptly attended to.

ANDREW HUNTER, Patentee. 3v14t

HUNTER'S  
IMPROVED CONCENTRATOR.

**THE INVENTOR OF THE ABOVE RECENTLY IMPROVED** Machine, is now prepared to take contracts for concentrating gold or silver ores, and will guarantee a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs. 1v14

## Brodie's Patented Improvements.

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this Improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than walnut—\$1,000

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... \$500

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... \$1,200

**EXPLANATION OF THE ABOVE ENGRAVING.**  
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, is adjustable to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, gives the movable jaw, B, a forward and downward motion at the same time, which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County.

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: I beg to pleasure to inform you that I have, for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely meeting my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st No. 1866, the royal charter of the said Barrel, using the same will be reduced to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 29, 1865.

Express Building, 402 Montgomery street, San Francisco. 12v13d

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the valve facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C. The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of water more than with the pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, are for sale by

120 Front street, San Francisco  
These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public, that the illustration and description of this Pump, published every other week in this paper. 1v14t

Practical Mining Engineer.

## The Abrogation of all Mine Taxes.

In reply to a resolution introduced by Mr. Conness into the United States Senate, the Secretary of the Treasury, Mr. McCulloch, on March 25th, transmitted a letter to the Senate relative to the taxation of mining interests, and in such letter he incloses what he terms a very interesting communication which has recently been received from Louis A. Garnett, of this city, who was formerly an officer in the Branch Mint here, but now connected with a very extensive silver refinery, which communication was prepared at the suggestion of John Jay Knox, of the Treasury Department, during his late visit to this State. In this communication, Mr. Garnett urges "a complete abrogation of all taxes and restrictions upon mining enterprises." He declares that mining operations are so unremunerating that not one man for each \$100,000,000 of bullion extracted, has grown rich by working the mines. He advises that the expense of coinage be assumed by the Treasury. Subjoined is an extract from the letter of Mr. Garnett, alluded to:

"The mines of the State of California and the adjacent Territories have, for the past 17 years produced an average of \$60,000,000 per annum, or aggregate of \$1,000,000,000 of bullion; and yet so unremunerating are mining operations as a whole, that it would be difficult to-day to find in that State one man for each \$100,000,000 who has grown rich by working the mines. Mining is to-day, as it always has been, a fascinating illusion, and a complete abrogation of all taxes and restrictions upon mining enterprises, and the repeal of all charges at the mint, would tend to develop the country and enhance its products. The present tax levied upon foreign bullion naturally drawn to this country for assaying, refining and coinage, amounting to one and three-quarters per cent. on gold and two and a half on silver, has the effect to repel the products of Mexico and British Columbia, and to force them into other channels. The coinage of money is a necessity of the Government and a benefit to the entire community, and its expense should not be borne by the few who produce the material. Other Governments have long since restricted their mints to coinage only, and if the Secretary of the Treasury will contract with private refiners for an exchange of crude for refined bullion, and throw the expense of coinage upon the Treasury, the results which will arise in the reduction of the price of gold and the subsequent advance in our national securities will much more than compensate for the loss of revenue from this source."

The suggestions of Mr. Garnett with regard to the abrogation of all mining taxes, are well worthy the attention of Congress, and are most wise and just; but his idea of making the miners of the Pacific coast dependent upon the tender mercies of a corporation for refining their gold, should never be carried out, except with ample qualifications and guarantees that they shall in future be as well and cheaply served as they now are by the Government. A corporation promise to that effect would be as idle as the wind, and as little reliable. The only way to effect such an object, would be for the Government to act as principal in the matter, and become responsible to the miner for his deposit, employing such private persons to do the refining as would do it at the cheapest rate, and in a manner most satisfactory to the parties immediately interested. The procurement of bullion from the storehouse of nature, is one of the first wants of the Government and the people—and it should be the policy of the Government to promote such a business in every reasonable manner. One of its first acts should be to remove all hindrance in the way of taxes upon bullion, and at the same time have a care that the miner should have facilities at hand for refining the product of his mine at the lowest possible rate. The expense of coinage might very properly fall upon the treasury of the nation.

**ASPHALTUM.**—Large quantities of this article are being shipped through Wilmington to this city, where it finds a ready market at a fair price.

**HOW TO PRODUCE STONELESS FRUIT.**—At a late meeting of the Agricultural Society in India, the Rev. Mr. Firminger communicated a plan by which the stones of fruit may be reduced or made to disappear, and the pulp increased in size and flavor. At any time during the cold season select a branch that is to be used afterward for inarching. Split it up carefully somewhat less than a span long. From both halves of the branch thus split scoop out cleanly all the pith; then bring the split halves together again, and keep them bandaged till they have become thoroughly united. At the usual time, the beginning of the rains, inarch the branch thus treated upon suitable stock, taking for the place of union the portion of the branch just below where the split was made. Upon a branch of the tree thus produced a similar operation is performed, and so on for successive seasons, the result being that the stone of the fruit becomes less and less after each successive operation. This process has been applied likewise to the grape vine at Malaga, and plants thereby have been produced which bear the finest fruit, without the slightest vestige of a stone within them.

The Japanese, it is said, have the art of feeding turtles and other crustacea on *aurum potable*, or some liquid preparation of gold, which gives them a most gorgeous and gilded appearance. Several of these gold turtles and crabs have been sent to the Paris Exhibition.

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. M. PRAG is NOW PREPARED TO MANUFACTURE M. Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.  
M. PRAG,  
8v13-ly Stave Store, No. 125 Clay street, below Davis.

#### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequaled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

On Hand and for Sale.

**THE CELEBRATED  
Self Generating Portable  
Gas Lamp.**

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, and for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.  
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to penetrate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.  
A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.  
When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton tag, one inch wide and four, or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.  
Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-3m

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.  
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the uttermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
All sizes on hand from 3 to 30 horse power, with and without carriages.  
Also, Portable Saw and Grist Mills.  
For sale by  
**TREADWELL & CO.,**  
9v14-6m1p Corner of Front and Market streets.

**HOW DIAMONDS ARE COLLECTED.**—The Boston Leader says: "We have received a letter from Mr. H. M. Lane, who has just visited the mines of Brazil, and tells us that in taking the gems from the earth a driver places his gang of slaves in a mud-hole where the gems are found, and pans out the earth in the water like gold-washers. The negroes are naked, to prevent them secreting the diamonds in their clothes. They are required to work facing the overseer, and are forbidden to raise a hand to the face, lest they should swallow the jewels when found. Yet they do carry them away, by becoming so expert that they can snap them with the fingers from the pan to the mouth without detection."

The diamonds of California are found, we believe, only in the "ancient drift," which overlies the present river courses. Their finding is generally accidental; no regular working for them has ever been attempted, or could be made with profit. They are usually found by miners when "washing down," preparatory to "cleaning up." Their extreme brightness and purity would naturally attract attention, and many more would doubtless be found if our miners would familiarize themselves with the peculiar form of crystallization which that gem assumes. There is a peculiar curvature to the faces never found in quartz crystals, which may be especially observed in figure 266, page 24, of *Dana's Mineralogy*, a book which is now in the hands of many miners. If a miner should once closely examine a diamond before it is cut, he would be very likely to recognize its peculiar form at once whenever he should again see it.

#### Important Notice.

#### Another New Doctor in the Field!

DR. H. A. BENTON,

Has been performing many wonderful cures in this city the past two years, and, as his practice is fast increasing at the office, he finds it difficult to attend all the outside calls, and has concluded to invite R. H. OLMSTEAD, M.D., to join him. Dr. Olmstead, of Napa City, has been eighteen years successfully treating obstinate cases with water, electricity, and the magnetic forces. Remedies of the Eclectic School, of which he is a graduate, can be resorted to when needed. Being the seventh son of a celebrated physician, and at the same time having a powerful organization, his magnetic hands like magic dispel pain and disease. He is also a natural bone-setter. Dr. Olmstead has this day associated with Dr. H. A. Benton, the Medical Electrician and Homoeopathist, at his office, 314 Bush street, San Francisco, who, having all the necessary facilities, such as the patent Electric, Chemical, Sulphur, Vapor, Hot Air and Medicated Baths, which aid in curing all curable diseases, whether acute or chronic, and with the combined skill, together with an excellent lady assistant, gives an assurance of cure to many, benefit to all, and injury to none.

N. B.—Terms for treatment within reach of all. Office hours: from 9 A. M. to 8 P. M.; Sundays, by appointment. Lodging rooms convenient for those who come from the country.

June 1st, 1867.

Rubber and Leather Belting, Etc., Etc.**

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

**Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,**

With newly invented Water Bottom, which entirely surrounds the fire, grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the Boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

**HOADLEY'S THRASHING ENGINES.**

**HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.**

### Foundry for Sale.

A One-half Interest in the

**UNION IRON WORKS,**  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

### A Good Bargain

May be bad, as the proprietor is going home to Enrope. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
Sacramento, Cal.

## Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.  
On the 10th, 18th and 30th of each month that has 31 days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding, when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:  
June 10th—CONSTITUTION.....Capt. W. F. Lapidge, Connecting with the RISING STAR, Capt. Gray.

June 18th—GOLDEN CITY.....Capt. Jas. T. Watkins, Connecting with ARIZONA, Capt. Harris.

June 29th—MONTANA.....Capt. Jos. Sutton, Connecting with OCEAN QUEEN, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines can be obtained at the office of the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports apply to Messrs. WELLS, FARGO & CO.  
The COLORADO will be dispatched July 4, at noon, and will be followed by the GREAT REPUBLIC on August 24th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

## Devoe's Patent Oil-measuring and Can-filling Apparatus.

This invention, made and patented by Geo. W. Devoe, of New York, consists in a novel apparatus, designed more especially for measuring petroleum oil during the operation of filling the cans in which it is placed for transportation, whereby a number of cans may be rapidly and easily filled

on each side of the lower part of this tube are hangers, upon which the funnel, M, is suspended, the mouth of the tube opening in the interior of the funnel.

The cock, K, being closed, and F being opened, so as to admit the oil from the reservoir, B, into the measuring vessel, E, the oil as it enters E displaces the air, which rushes out through the pipe, G, and sounds the whistle, c. As the oil rises in the measuring vessel above the lower end of the pipe, G, the escape of air through the pipe

from E is replaced by air, which passes through the pipe, G. The foremost can, C, being filled, is removed, and the rear can, C', is thrust forward to take its place.

By means of this invention, the filling of cans with the exact and full quantity of oil is insured, and the process of filling is much accelerated. It has been stated that in the markets upon this coast the cans of the firm of F. W. Devoe & Co., filled by this apparatus, command at least two cents per gallon more, in price, than those otherwise filled; the lesser price of the oil of other shippers being in consequence of short measurement, which in some cases is one gallon in every case of four five-gallon cans. The immense extent of the petroleum manufacture at the East, and the universality of the use of this product, attaches much importance to this invention, as by its use the public will be more thoroughly protected from error or cheating in this universal article of consumption. Would it not be well for our California refineries to provide themselves with this device?

Further information with regard to this invention may be had on application to F. W. Devoe & Co., New York City.

## The C. P. R. R. Exploring Expedition

Among the passengers by the last steamer from the East, was the scientific corps composing the important Central Railroad Exploring Expedition, set on foot by order of Congress, and placed under the general direction of the Secretary of War. The party consists of the following gentlemen: Chief, Clarence R. King; Topographical Assistants, James Gardner, H. Cnstar, Frederick A. Clarke; Geological Assistants, James D. Hague, Arnold Hague, Samuel F. Emmons; Botanist, W. W. Bailey; Zoölogist, Robert Ridgway; Photographer, T. H. O'Sullivan. Mr. King is a graduate of the Sheffield (Yale College) Scientific School, and is well known on this coast as having formerly been connected with the California State Geological Survey.

The section to be surveyed is the belt of country along which the Central Pacific Railroad will be constructed, from Virginia City to Denver—about 900 miles; the object being to ascertain its mineral and other resources. An accurate map of the country, embracing a strip of seventy-five or one hundred miles wide, will be prepared. Careful search will be made for coal, the discovery of which along the line of that road will be worth much more to the country than gold or silver. Water will also be looked after in the desert places. The agricultural character will be pretty thoroughly studied, and the flora and fauna of the country will come in for a reasonable share of attention. Three years are to be occupied in the survey, which will doubtless be extended to fully six, or until the steam horse courses, with uninterrupted track, from the Pacific to the Atlantic.

The party is composed of young and energetic men; but such as are well up in their respective departments, and their outfit is full in material and excellent in character. The military authorities on this coast are instructed to extend every needed assistance to the party and the enterprise. An escort of twenty or thirty cavalry will be detailed as a protection from hostile Indians in the desert regions to which they are going. The enterprise is one not altogether devoid of danger, and must be accompanied with the most incessant toil and exposure. There is honor to be won in the field to which they go, and usefulness to be accomplished to no ordinary extent. May the fullest success attend their efforts, and the pages of science be greatly enriched by their labors.

with an accurately-measured quantity of oil at one and the same time, thus reducing in a very great degree, the labor required in such measuring and filling operations as ordinarily performed. The invention is illustrated and described as follows in the American Artisan:

Fig. 1 is a perspective view of the apparatus, and Fig. 2 is a sectional elevation showing the reservoir and mode of filling the cans. Upon an upright frame is placed the reservoir, B, which holds the oil with which the cans, C, C', are to be filled. Situated underneath this reservoir is a longitudinal shelf, upon which any desired number of measuring vessels, E, are arranged in a row, the capacity of these measuring vessels being equal to the quantity to be contained in the cans, C. Each measuring vessel is connected with the reservoir, B, by a tubular neck, in which is placed the cock, F, by which communication between the measuring vessel and the reservoir may be opened or closed as desired. Projecting upward from the upper end of each measuring vessel, E, at or near the lower part of the tubular connecting neck, is a pipe, G, which has fixed upon its upper end a whistle, c, which is sounded by the air issuing from the pipe while the measuring vessel is being filled. Extending downward from the forward portion of the bottom of each measuring vessel, E, is a short tube, in which is placed a stop-cock, K. Situated

and the sounding of the whistle ceases, the cessation of sound indicating that the vessel is filled. The valve, F, is then closed, and

communication from B shut off, and the valve, K, then opened, permitting the flow of the oil into the can, C. The oil displaced

## A New Smelting Furnace.

Mr. Mosheimer, of this city, has shown us the drawings for a lead smelting furnace, which have been prepared by him for a New York company, of which Col. Sherman Stevens is the Superintendent. The mine on which this furnace is to be erected is situated near Owen's Lake, and is called the "A No. 1." The ore is a carbonate of lead, intermixed with spar, and assays about \$100 per ton in silver. The mine has been well opened to the depth of 200 feet, showing continually the same character of ore, several hundred tons of which are already out and awaiting the erection of the smelting works. The ore is reduced in a kind of reverberatory furnace, to which are attached two regenerating chambers, something on the plan of the regenerating chambers in a Siemen's furnace. These chambers are for the purpose of utilizing the waste heat, which is accomplished in the following manner: In the rear of the furnace are constructed two large chambers, each of which has its own connection with the outside atmosphere, with the interior of the reverberatory, and with the under portion of the fire-place of the same. When the reverberatory is put in blast, the waste heat and waste products of combustion, instead of being allowed to pass off into the atmosphere, are conducted into one of these regenerating chambers, which has first been filled with a mass of rock, tiles, or any other convenient material. The heated air from the furnace, in passing through this mass of material, imparts to it all its surplus caloric. When the contents of the first chamber have thus become well heated, the direction of the escaping air and gases from the reverberatory is changed, so as to pass through the other furnace, while the natural draft for the reverberatory is made to find its way through this heated mass. The result is that the furnace is fed with a "hot blast," heated by its own waste heat; the draft being alternated and made to enter the furnace first through one chamber and then the other, while the escaping gases are subjected to a corresponding alternation. Thus, after the first chamber is once heated, a constant hot blast is kept up, greatly economizing fuel and adding very materially to the efficiency of the furnace.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Cement Mining in Nevada County

NEVADA CITY, May 24th, 1867.

MESSEURS. EDITORS: I have just returned from a visit to such of the principal claims on the celebrated Blue Lead as lie within the boundaries of Nevada county, and presuming that any information relative to these claims, will be welcome to your readers in San Francisco, many of whom are peculiarly interested in these mines, I furnish you with the following facts: Starting at

YOU BET,

Which is one of the most prominent mining towns on the Blue Lead, and which has added as much, if not more to the gold product than any locality in California, we find four claims, three of which have for years been celebrated for their richness, and the fourth, hitherto little known, is now about to take a front rank in the rich mines of the world. I refer to the claim of M. J. Hydcliff, in which, within ten days past, cement of extraordinary richness has been discovered.

## HYDCLIFF'S CLAIM.

This claim is in all respects a model one, having been worked under the directions of Mr. Hydcliff, a practical miner of many years experience, and sole owner of the claim. It is worked through a large, dry tunnel 1,000 feet in length, eight feet high, and six feet in width. Air is supplied by what is known as a "water blast." This tunnel was started very low down in the cañon, and has sufficient pitch to drain the mine and run out the ore without any expenditure of water or steam power in hoisting or pumping. In consequence of these great advantages, Mr. Hydcliff's mine can be worked at a much less expense than any other claim in this part of the country. For the first 250 feet, the tunnel runs through bedrock, it then strikes into the cement, and 200 feet further on runs through a pay streak about 100 feet wide, in which free gold is plainly visible. Mr. Hydcliff was satisfied, however, that he had not reached the main channel of the Blue Lead, and after drifting a few feet resumed operations on the main tunnel and run about 500 feet further, when his perseverance was rewarded by finding the main channel, upon which he is now working. The lead presents a pay streak about five feet in depth, width as yet unknown, though half a dozen men are engaged in "breasting" on it. Below this strata, and to a depth varying from twelve to eighteen inches down to the bedrock, the dirt is of fabulous richness, and in spots one-tenth part is gold. "Seeing is believing," and on my return I shall exhibit to you some specimens, which I took at hazard, from this layer. The mill is of the best construction, of the Miners' Foundry, runs ten stamps, with water for the motive power, and has a "hurdy gurdy" wheel of eight feet diameter. Mr. H. claims that his mill will do more work than any other in the county of the same capacity. He has expended more than \$25,000 in opening this mine and putting up the mill, and his energy and perseverance have finally met their reward. He is now clearing over \$1,000 per week, which amount can be increased 50 per cent. as soon as a side drift now being run connects with the main tunnel. He works eighteen men; two shifts of hands of nine each, and his total expenses with this force are less than \$100 per day.

## OTHER CLAIMS.

Next adjoining, and further up the cañon, are the claims and mills of Neece & West, Brown & Co., and Mallory & Co., all noted for the immense sums of money they have paid their owners. Last season Neece & West took out \$60,000 in ninety days. They are now prospecting. Brown & Co. recently resumed work, and have found paying cement. Mallory & Co. have suspended crush-

ing, and are engaged in prospecting. The above mentioned claims are 800 feet locations.

Besides its cement interest, the neighborhood of You Bet has extensive hydraulic ground, now abandoned because the cement is so hard as to be impervious to the action of water. When labor and water are cheaper, and capital finds its way here, these immense banks will be disintegrated by blasts of nitro-glycerine and washed away; then you may expect to see a revival of the old-time prosperity of this section of country.

The wagon road from Nevada to this point, is now being extended to Dutch Flat, via Little York, and will be finished by July 1st. The distance from Nevada to Dutch Flat is sixteen miles, and on no road in California can grander scenery be viewed or such extensive mining operations. Further on we come to

RED DOG,

A town of forty or fifty houses, and the center of another formerly rich mining focus on the Blue Lead. There are four cement mills here; but not one in operation, and very little prospecting is being done. The lead has been lost in these claims, for cement mining is not unattended with the risks incidental to the search for the precious metals in all its forms. This town was totally destroyed by fire in August last, and has been rebuilt. The hydraulic claims here have paid their owners immense sums, which have been spent abroad instead of developing the resources of the country. All that has been said of the future prospects of You Bet, applies to Red Dog. A trail from this place, crossing Greenhorn Creek, brings us to

HUNT'S HILL.

Ten years since this was a populous mining town. Like most mountain towns the houses were strung out in a straggling manner on a main street. Most of them have been destroyed by fire or gone to decay, and never have been rebuilt; but since the Blue Lead discoveries in the hydraulic grounds of the Gouge Eye and Eastern claims, a number of new houses have been built, and the place has a future.

## EASTERN CO'S AND GOUGE EYE CLAIMS.

These are adjoining claims, situated just below the town, and several hundred feet above the bed of Greenhorn Creek. Both claims are drained by a tunnel built jointly, and running through the bedrock, 1,000 feet to Greenhorn Creek. They have produced largely, both before and since the discovery of the Blue Lead. Each has a first rate 8-stamp mill. The Eastern Company has been hydraulicizing and has recently resumed crushing, taking the cement from the open cut, where it is four feet thick above the bedrock. They will soon commence a drift. The Nevada Transcript of a late date, erroneously speaks of this company as working their claims through a tunnel 500 feet long. The Gouge Eye Company are working their claim by means of a tunnel, and both companies are paying more than expenses. The lead is well defined in both grounds. Further up Greenhorn Creek, we find the 10-stamp mill of the Empire Company, owned by A. A. Sargent and G. N. Jacobs of Nevada. This claim is lying idle waiting for developments in the Green Mountain claim, a short distance further up the creek.

## THE GREEN MOUNTAIN CLAIM.

This is one of the largest and most promising claims on the Blue Lead, and on its success depends the question whether two miles of ground now unworked shall be developed. This claim was located many years since and profitably worked by its locators, some Cornish miners, by means of a "pepper box," whatever that is. They knew nothing of Blue Lead, and when their rude apparatus did not yield more than \$10 per day to the hand, abandoned it for better diggings. The claim is one of 1,500 feet, and is partly owned by Messrs. Sargent & Jacobs of Nevada. About half the claim is owned in San Francisco by Messrs. Smith, Eaton, N. A. Lacour and several gentlemen connected with the Miners' Foundry. The claim is under the charge of Mr. Jacobs, and is superintended by Mr. C. W. Huson, a practical miner and millwright, who is also one of the owners. They have a first class mill from the Miners' Foundry, which is run by water power, with a hurdy-gurdy wheel. The mine is worked through a shaft, about 150 feet deep, and has a pump of great capacity, though they are not troubled with water enough to test its merits. Both hoisting and pumping are operated by water power.

From the bottom of the shaft a main drift was run and several prospecting drifts branch out from it. The lead was discovered a few feet from the workings of the old company, and although the company are working on pay dirt, they have not struck the main channel; but the prevalence of immense

boulders, while they interfere with the progress of the work indicate the proximity of the channel. The lead here is about 175 feet below the surface of the ground, and has shown great improvement within a few weeks. When the main channel is struck a drift will be run to connect with the old tunnel of the Cornishmen, which is several feet lower, and by this means the mine will be drained, thus enabling the company to dispense with their pump, and give them additional room for hoisting, and more power for the stamps. The company have expended over \$25,000 in their mine and mill, have about 1,000 feet of drifts, and their enterprise must soon be rewarded with rich returns.

## QUAKER HILL.

Two miles above the Green Mountain mine are the hydraulic claims of Quaker Hill, on Greenhorn Creek. I understood that Mr. Jacobs had a rich clean-up from his ground this week. The Blue Lead has not been developed any further in a northerly direction, and I turned off here for Nevada City. But before leaving Greenhorn Creek, let me say a few words about a new enterprise just organized by San Francisco capitalists.

## TAILINGS.

A company has been organized by Sanford and others for washing the tailings of Greenhorn Creek. The company has purchased and located the bed of the stream for a distance of ten miles from its junction with Bear river, and will soon commence operations. In the judgment of all the miners I have conversed with, this operation will prove a great success, and will inaugurate a new system of mining in California, as there are many miles of other streams as rich as Greenhorn. I have heard various estimates of the amount of gold in Greenhorn, but they all seem so fabulous that I dare not risk putting their estimates in print.

W. A. S.

THE MAILS UPON RAILROADS.—A proposition has been made that Governments should declare the principal railroads of the country to be post roads, and place upon them mail cars, to be run by Government employes, said cars to pay a toll to the railroad companies. Since the railroad managers throughout the country have so generally contrived to throw the chief profits of the roads into the hands of the holders of stock in express companies, they have endeavored to keep up their dividends by means of mail contracts. So exorbitant have they become in their charges (for in many places there is no chance for competition) that the Government has absolutely refused to take their bids; but compelled them to carry the mails at such prices as the Government sees proper to pay. Many of the railroad companies are taking this money under protest, intending to have the matter adjusted by the courts.

As a remedy against the alleged extortion, it is now proposed, as above, that the Government run its own cars, and carry the mail independent of the companies. It would not be surprising if such a result should eventually be arrived at. The idea is to construct a vehicle somewhat after the manner of the "steam passenger car," of sufficient capacity to carry its own motive power, with the mails and one or two mail agents, engineer, etc. It is estimated that such a car can be run for \$12 per each 100 miles, including repairs, wages of drivers, agents, etc. This, it is claimed, after allowing a fair compensation in the shape of toll, would make a saving of over one-third from the present cost of transporting the mails. There can be no doubt but that Government might safely undertake to do both its own mail carrying and its own and the public telegraphing, (as suggested two or three weeks since) on most of the principal mail and telegraph routes of the country, and thus save a vast amount of money to extend increased facilities to new routes, during the infancy of their existence, while they are unable to be made self sustaining. The route between Boston and Albany has been suggested as one on which to try this experiment. Eight machines will perform the service, and they can be constructed at a cost not exceeding \$10,000 each. There is no question but that the public is entitled to greater accommodations than is generally extended to it by corporations, which, after obtaining special and often exclusive privileges, too often conduct their business with a reckless disregard of that public which has created them, and nourished them into healthy activity.

## New Machine for Cement Working.

Captain J. D. Cox, of this city, has recently invented a machine for the more thorough and ready working of cement gravel, one of which has been put up at Texas Hill, near Placerville. The machine is described in the Placerville Courier as a pan, six feet in diameter, with four revolving arms, on each of which are three fingers, about three feet in length, which extend down into the pan, almost touching the bottom. The pan is made for four fingers, which will accelerate the working power by reducing the time required to separate the cement from the stones. The bottom of the pan is made of four cast iron plates, an inch and a half in thickness, with apertures for the cement to pass through when freed from stones. Those apertures are about three inches in length and an eighth of an inch wide, allowing gravel and cement one-eighth of an inch in size to pass into the sluices beneath. After a charge is worked, the pan is opened by means of a trap-door in the bottom, worked by levers, and by two revolutions of the arms, it is entirely cleared of debris. Owing to defects in the pipe, he is now using thirty inches of water, with a pressure of 300 feet, but is satisfied, by experience, that with properly arranged pipe it will require but fifteen inches of water. The Courier says that by the use of this machine a ton of cement may be separated in ten minutes, effectually removing every particle of cement and grit from the stones. Pieces of cement weighing twelve or fifteen ounces are thrown into the pan and knocked to pieces in two or three revolutions of the fingers. The revolving arms and fingers are driven through the cement at the rate of forty-five or fifty revolutions per minute. This machine is calculated to separate 100 tons of cement in twenty-four hours, at an expense of about fifteen cents per ton. Many persons have been to see it work, and all join in saying that it is just the thing needed to work the immense beds of cement, which cannot be profitably worked by the old process of crushing. The cement on which the pan has been tried was described as being very hard, but was readily freed from the worthless boulders. Mr. Cox intends putting up another pan soon. If this pan can accomplish what is claimed for it, there is no doubt but that it will prove really a useful invention, and give value to immense quantities of cement that is now worthless by reason of the great cost of working it.

A PISCATORIAL PHENOMENON.—The Neenah (Wis.) Times of April 2d, chronicles a most extraordinary piscatorial phenomenon, in substance, as follows: On the morning of the day previous the flumes of the numerous mills in the villages of Neenah and Menasha, were suddenly inundated by a most extraordinary multitude of fish, so numerous as seriously to impede the flow of water, and compel the stoppage of the mills? The fish were of all kinds which inhabit those waters, from the smallest perch up to sturgeons weighing 100 pounds. The inhabitants from all the country around flocked to the spot, caught them by hand, and carried them off in cart loads. They were discovered at early dawn, and it was not until evening that a break was made in their ranks sufficient to enable the water to be used for mill purposes! Various surmises are suggested to account for this singular phenomenon, the most feasible theory being that the ice in the lake near by, commenced to break up suddenly, and so frightened the piscatorial inhabitants thereof as to drive them in huge shoals into the outlet of the lake, upon which the mills aforesaid are located. The paper from which we condense this account, appears to give it in all seriousness, and we have no other reason to doubt its verity, except the suspicious circumstance that it is said to have occurred on the first day of April.

REGENERATION OF BONE.—Some French savans have offered a prize of \$4,000 for the best essay on the "regeneration of the bone." They declare that experience and observation seem to indicate that amputation may be almost entirely superseded by the creation of new bone.

## Mechanical.

## Substitution of Steel for Iron.

The substitution of steel for iron in ship building, and in the construction of engines and boilers, is a subject which is just now occupying much attention. The generality of engineers appear to incline to the opinion that steel can be so used with safety at about one-fourth or one-third less in size than iron; still there are many, especially among the most skillful of practical men in England, who hold that this is a subject which should not yet be considered settled, but which may still be discussed with reason and to good purpose. There are those who have had much experience in the use of both iron and steel, who either deny altogether or at least express the gravest doubts as to whether steel promises any advantage over iron for most purposes where tensile strength is required, as in sea-going ships and steamers, or in engines and boilers.

The results of experiments on the tensile strength of steel for the above uses are held by many to be so widely different from each other as to prevent their being safely relied on in practice. It appears from a statement lately placed before the Institution of Engineers and Shipbuilders of London, by the Surveyor to the Board of Trade of that city, that steel boilers, made by one of the most eminent engineers in that country, had been taken out of a mail steamer as unserviceable after only one year's run, while a large number of the managers of steamboat companies say that, from the results of their own experience, they cannot place as much reliance upon steel as upon iron shafts; but it is suggested that such experience might have been the consequence of an unfortunate selection of steel. The same objections have also been urged against the plates and frames of sea-going vessels; but it is noticed that they do not hold good in case of vessels navigating smooth or inland waters, where the inequality of strain is less than in sea-going craft. It appears to be universally conceded that in river steamers, where light draught and high speed is desirable, steel may be advantageously employed.

Steel, it is held, may possess superior tenacity; but that is not the only property required. The material should work well in the fire and between rollers—it should not buckle or twist in the hands of the workmen, especially in the form of sheets, when being placed upon a ship's frame or worked into a boiler. In thus putting steel together, it is found that much greater care is required from the workmen in fitting, counter-sinking, riveting, etc., than in working iron. Steel plates often buckle and fly under the hammer, and crack or become imperceptibly weakened in riveting up. In heavy soaway, steel plates have been known to shear off their iron rivets, which iron plates could not do; and when steel rivets have been used, the heads have been known to fly off in consequence of brittleness.

Brittle plates, and plates otherwise inferior, will sometimes find their way into iron vessels, thus reducing the entire structure—ship or boiler—to the level of the weakest plate; but this class of danger seems to be much greater when steel is used.

In steel ships, the plates are often found so badly sprung before launching as to render the position of almost every rib on a ship's side visible to the outside observer. Workmen say it is almost impossible to lay on the sheets smooth. Even if their steel plates are stronger when new than thicker iron plates, it is claimed that, if corrosion goes on at about the same rate in each, as it will do, the steel plates, by reason of their less thickness, will give out much sooner than iron. We have heard of but one reliable experiment carried to the bursting point in the hydraulic test of a steam boiler, and that was recorded in a St. Louis paper of the 4th of March last. This boiler, accord-

ing to the usual tables, should have stood a test of 480 pounds of pressure to the square inch; but it burst at only 222 pounds. The rupture occurred in two sheets near the supply pipe. The boiler stood the test only to 200 pounds without injury, and burst at less than one-half its calculated tenacity. This experiment speaks in language which should not pass unheeded. Does it not teach us that we habitually over-estimate the ultimate strength of steam boilers? Do we not betray a lack of wisdom in seeking for a theory to account for the bursting of steam boilers, when the danger lies in our miscalculation of their ultimate strength?

**TEMPERING STEEL BY MEANS OF OIL.**—In a work on the management of steel, by Mr. George Ede, the author says: "When first the oil commences to smoke, the temper would be that of a straw color, or about a temperature of 450° Fahrenheit. A darker and more abundant smoke indicates a brown temper, or 500°. A purple temper, about 530°, is shown by still more abundant and black smoke. A blue temper is reached when the oil first takes fire on the application of a flame, but ceases to burn on its removal; this shows a temperature of 580°. The usual temper for springs is shown by the oil taking fire and continuing to burn; while, if it is to burn itself away before the articles are removed, it imparts the temper which clockmakers mostly use for their work, where the steel is scarcely harder than in its natural state. When a tool is required especially hard, red-hot lead is recommended to heat it with, the tool itself being first raised to a dull red heat and hammered; of course, when withdrawn from the lead, it must be quenched as usual in cold water."

**PLUMBAGO AS A SUBSTITUTE FOR OIL IN LUBRICATION.**—The inconvenience attending the use of fatty matters generally for lubricating purposes is well known, yet oil and grease have hitherto been accepted as necessary evils. The English "Patent Plumbago Crucible Co.," have recently introduced, under the name of anti-friction powder, a material which appears to consist principally of finely ground plumbago, which overcomes all objections; it is impalpable, perfectly free from grit, and hence there is no fear of its cutting the machinery, but, on the contrary, will polish and cleanse it. As compared with oil or grease, it is claimed that the anti-friction powder has many advantages; for instance, it is impossible for it to work into ridges. Further, it will not catch the dust and hard atoms that may be flying about, as grease does, and it will wear for a great length of time. Having an affinity for metals, the powder fills up the pores, and thereby keeps them cool, and on coming into contact with a body it adheres to it, etc. It appears to be coming into quite general use among some of the heavy companies in England. It is said to be equally applicable to either slow or quick running shafts.

**IRON WIRE** is usually covered with brass by placing it first into water acidulated with muriatic acid, and holding some sheets or blocks of zinc where the iron is coated very thinly with the latter by means of a battery, after which operation it is simply placed in a solution of blue vitriol. A more durable coating is obtained by the following means: The copper solution is mixed with salts of tin in the proportion of one of blue vitriol to three quarters of salts. The wire covered with zinc, as above directed, is then left in this bath five or six minutes, and then drawn and polished, which operation imparts to it the proper appearance.

**HOW TO AVOID THE GOPHERS.**—C. M. Early and C. Sanborn, of Earlville, Delaware county, Iowa, have communicated to the American Institute at New York, what they claim to be a fact, that if seed corn be smoked along with the meat in a smoke-house, it will grow just as well, while gophers, chickens, worms, or squirrels will not touch it; they have not learned to love smoke like most of human kind. If corn may be thus protected, why not vegetables as well? If such should be the case, the fact would be invaluable to California, which is more plagued with gophers and squirrels than perhaps any other country.

## Scientific Miscellany.

## Frost Pictures.

**EDITORS PRESS:**—Every one has seen and admired the beautiful frost pictures on window panes, polished metal surfaces, etc., on a cold frosty morning. The most beautiful that ever came under my notice, were produced in one of my operations of making artificial ice. After the congelation was through, and the ice removed from the congelator, some little of the liquified gas remained in the congelator, and, on agitating it, was so suddenly vaporized as to produce such intense cold that the outside of the congelator became instantly covered with the most brilliant and beautiful frost pictures it has ever been my pleasure to behold. They were of the form of an oval leaf, and all of one form, with their edges raised and with a feathery outline, as though the surrounding vapors had been instantly congealed in minute crystals, and attracted to the cold surface like iron filings to the magnet. The whole outside surface of the machine presented a beauty more brilliant than chased silver. I called in a few persons that were near to admire this opalescent beauty, who looked with awe for a few minutes, and all were gone, perhaps never more to be reproduced. The machine is of copper, and the pictures were all of one form. Had the kind of metal anything to do with their regularity? Was it crystallization or electricity that produced this astonishing and brilliantly beautiful effect?

W. R. FRANK.

**METALLIC COMBUSTION.**—Whenever thin sheets of metals are used to connect the poles of galvanic batteries, as gold or silver leaf, tin foil, etc., and in that position subjected to a current sufficiently powerful to produce combustion, the different metals burn with a kind of hissing noise and with variously colored lights. Gold burns with a bluish white light, and leaves a dark brown oxide; silver burns with a bright sea-green color, and emits a grayish vapor; copper gives out a bluish green flame, mingled with red sparks and green smoke; zinc burns with a dazzling white light and white vapor; tin throws off red sparks, and lead burns with a purple flame. When charcoal points are used and brought into near contact, a dazzling white light is given off (the electric light); but no combustion, properly speaking, takes place. An extremely minute loss of weight only occurs, while the points become slightly increased in density. The phenomena are attended with more vivid brightness if the points are placed in vacuum, or in any of those gases which are non-supporters of combustion.

**THE American Association for the Advancement of Science** will hold its 16th annual meeting at Burlington, Vermont, commencing on Monday, August 21st. The last meeting of this association was held at Buffalo, N. Y., and continued for a week. Upwards of ninety members were present and one hundred and twelve new members were elected. The annual meetings of this association are assuming a marked importance in the aid of progressive science.

**ALBINO AMONG THE FISHES.**—Mr. J. W. Putnam recently exhibited at the Essex (Mass.) Institute, a singular specimen of the Horned Pout (*Pimolodus atrarius*, De Ray) from Lake Champlain. The fish was pure white, thus showing that albinos occur among fishes as well as among birds and animals. This, we believe, is the first recorded instance of albinism among the finny tribes.

**HEAT FROM FRICTION OF WATER.**—The Boston Journal states that recently an egg was placed in a vessel of cold water, which was made to revolve 232 times a minute. The egg was boiled in six minutes, the only heat being the friction of the water.

**HEAT CHANGES PRODUCED BY MIXING DIFFERENT LIQUIDS.**—Many liquids, on being mixed, exhibit an increase of temperature; and it is said to be a singular fact that the liquids which present the greatest increase of bulk on being mixed, are usually those which develop the most heat, at the instant of mixture—such as sulphuric acid and water, ether and chloroform, alcohol and water, etc. The only instance hitherto noticed of a diminution in bulk, is the mixture of chloroform and bisulphide of carbon; a decrease of heat also takes place at the moment of union of the two liquids. Aside from the loss of heat resulting from a change of volume, there exists a cause which absorbs heat equal and sometimes greater in amount than that given out by the combination of liquids. This cause, perhaps, may proceed from the separation of homogeneous particles necessary for the diffusion of the liquids.

**DEODORIZING VULCANIZED RUBBER.**—Vulcanized rubber may be deodorized by covering the articles made of rubber with charcoal dust, and placing them in an inclosed vessel, which is submitted to a temperature from 76° to 94° Fahrenheit during several hours. The articles, on being removed and cleaned, are found to be free from odor, and not the least changed in form, even in its most minute details.

**EXTRACTION OF POTASH AND SODA FROM FELDSPARS.**—M. Daubrée placed feldspar and distilled water together in a cylindrical vessel to which was given a rapid rotation on its axis. By this movement the feldspar was found to undergo decomposition and the water to become alkaline. Considerable quantities of potash and soda were separated—the amount varying with the quantity of rock operated upon.

**IODIDE OF SILVER PHENOMENON.**—Fizeau, in his researches on the dilation of minute crystals, found the chlorides, bromides, and iodides following the same law of expansion by heat with the exception of iodide of silver. The crystals of the latter salt actually contract instead of dilating by the application of heat.

**TO DETECT SULPHUR.**—Dr. Vohl points out a means of detecting sulphur or its compounds in petroleum after refinement. The oil is to be digested for some hours at a gentle heat, with a small piece of potassium. Water being added, the aqueous solution is to be tested with nitro prusside of sodium. If the result is a deep purple solution, it indicates the presence of sulphur.

**SINGULAR FACT.**—It is said that a strong blast of air discharged from a pipe within a short distance of a flat surface, will not repel, but will attract any object placed in the intervening space. It has been suggested that safety valves are sometimes attracted to their seats in the same way, when a thin annular discharge of steam is going on under their edges.

**TO REMOVE SILVER STAINS.**—It is said that a concentrated solution of perchloride of iron will remove silver stains on the hands or clothes. If gallic or hypogallic acid has been used, it will be necessary to wash the spots afterwards with a few drops of a strong solution of oxalic acid.

**OBJECTIONABLE.**—Hydrofluoric acid has been used in oil as a bleaching agent. This is very objectionable; as, if the oil is used in lubricating, the acid injures the metal. In lamps it produces a highly irritating vapor, causing inflammation of the eyes, destroying color, and injuring glass.

**PHOSPHORUS BEARS,** for twenty or thirty seconds, without ignition, the action of radiant heat at a focus where, in the fraction of a second, platinum is raised to a white heat.

**TO MIX OIL WITH WATER.**—Dissolve about one ounce of potash in a pint of water; then add about half a gill of olive oil, and stir briskly, when they will combine and become whitish and opaque. These proportions will answer for any other quantity. Many lubricating oils are made upon this principle.

**A NEW THALLIUM MINERAL.**—A selenide of copper, silver and thallium has been found in Norway and analyzed by M. Nordenskiöld. It contains 17 per cent. of thallium.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

64,458.—IMPROVED AMALGAMATOR.—Walter L. Strong, San Francisco, Cal., assignor to himself, G. W. Strong and J. F. Taylor.

What I claim is, 1st, the shoes, e c and g g, in combination with the attaching joints, d and h, and the arms, D and G, substantially as and for the purpose described.

2d, The geared wheels, L m m, and the rim, n, in combination with the shaft, F, and muller, G g, as described.

3d, The wrench, D, with the shaft, P, operating upon the wheels, m m, rim, n, and shaft, F, substantially as and for the purpose described.

The nature of this invention is to provide an amalgamator of such a construction as to give the greatest effect to the grinding surfaces. This is attained by providing a pan of the ordinary construction and material, with a central hub, around which revolve two hollow shafts, carrying two sets of mullers, one above the other, which turn in opposite directions. We have already fully described this machine in previous numbers of the Press as one in which two sets of mullers are employed, revolving in opposite directions.

64,258.—AMALGAMATOR.—A. J. Senatz and G. W. Knowlton, Sacramento, Cal.:

We claim the copper hottomed pans with the iron rods or bars and slots in the end fastened to the sides of the pans with pins, and by means of which rods or bars the pans are fastened together and an undulating motion is secured for the water and earth, which are dashed upwards against the stationary riffles whereby the earth or sand is prevented from becoming solid.

We also claim, as a part of the same machine, the turned-up ends of these pans and the stationary riffle-beds connected with the pans, all of said parts being the machine in combination which produces the intended effect.

64,265.—WASHING MACHINE.—Adelia Waldron, San José, Cal., assignor to herself and J. H. Atkinson, San Francisco, Cal.:

I claim the double washboards, O and K, the eccentric buttons, B, the sash-frame, N, with clamp, C, the lever-handle, G, the spring, J, in combination and exactly as set forth and for the purpose specified.

64,297.—RAILROAD RAIL.—B. M. Esterle, San Francisco, Cal.:

I claim the railroad rail provided with alternate inclines, A and B, substantially as and for the purposes herein set forth.

## RECENT INVENTIONS.

IMPROVEMENT IN FURNACES.—The Gold Hill (Nevada) *Trespass*, says that Messrs. Thompson & Hutchinson have devised an improvement in furnaces for steam boilers, which is likely to be of considerable importance in economizing fuel. By the use of it a better and more perfect consumption of fuel—wood or coal—is effected. The improvement has been introduced at DeLand's mill, in Six-Mile Cañon. Under the old régime, but eight stamps were driven, with two pans. With this improvement, the entire force of the mill is worked—sixteen stamps, twenty-four Knox pans, four Wakely, two Hepburn. The improvement is adaptable to any furnace; the cost is slight; and the saving in wood, in producing a given amount of heat, is estimated at one cord in every seven. The inventors ask persons interested to witness the working of their invention at DeLand's mill.

NEW AMALGAMATOR.—The Columbia (Oregon) *Citizen* describes an amalgamator, recently invented by Messrs. Foreman & Mattison, as follows: It consists of an upright cylinder, into which is inserted a pipe extending to within 1½ inches of the bottom. The pulp, as it comes from the battery, is conducted into this pipe through a hopper. A jet of steam is directed into the pipe in the bottom of the hopper, which forces the quartz through the same into the quicksilver in the bottom of the cylinder. The action of the steam heats the quicksilver, and brings the gold into contact with it, whereby it is saved. The cost of the arrangement does not exceed \$40. We are not advised whether it has yet received a practical trial. Mr. David Stage, of Columbia, has the patent right for California and Nevada, and will dispose of the same to such as desire to avail themselves of its benefit.

TO TRACE A SHIP'S COURSE.—M. Carrodi, of France, has devised an apparatus for making a ship trace its own course. By means of wheel-work inside the binnacle, a long strip of photographic paper is unrolled horizontally with a given velocity. The card of the compass is pierced at the point usually marked "North Pole." In the hole is placed a small object glass, through which light passes, and on striking the moving photographic paper the actinic impression is made in the form of a line, which varies in direction precisely with that of the vessel, thus furnishing a daily diagram of the ship's course.

IMPROVEMENT IN WEAVING.—The sewing machine is likely to have a rival in an invention recently perfected by which wearing apparel of all kinds, shirts, pantaloons, vests, skirts, ladies' mantles, jackets, coats, etc., etc., are both woven and sewed at the same time. The sewing of the seams is stronger even than hand sewing and perfectly smooth and even, and the articles are woven and sewed of any pattern, of wool, silk, cotton, or any other material.

A TOR has been invented in Paris called the prolific top; it is set spinning by means of a thread and needle. As soon as it is fairly in motion a half dozen small tops come out of it—how? that is the inventor's secret—and begins to spin around it like the satellites around Jupiter, and after some time reabsorbs them.

NOVEL VEHICLES.—A new riding vehicle has made its appearance in Paris, which is mounted on very large wheels. The horse is placed between the wheels, whilst the driver and the carriage body are over the horse. Such a vehicle as this takes up but little room, and is very convenient in crowded thoroughfares.

Appropos to the above, a car has appeared in New Orleans, which is described as a very neat jaunting car or carriage on two wheels, drawn by one horse. The driver sits on a seat in front, as in a sulky, and two cushioned seats range lengthwise, affording ample and comfortable accommodation for at least eight passengers, who, four on one side and four on the other, sit back to back, their feet resting on a foot-board just clear of the low wheels to which is attached a splash board, protecting them completely from any mud sprinkling as they merrily dash along.

ELECTRIC RIFLE.—An electric rifle has been invented by a Frenchman, with a battery inclosed in the stock, the wires from which emerge near the breech and are connected with a very fine platinum wire, within the charge, which is thus rendered incandescent.

"THE ORGANIC VIBRATOR," is the name given by an Englishman to a small instrument which fits in the ear, is not perceptible, and by which the unpleasant sensation of ringing noises in the head is entirely removed. It is said to afford immediate relief to deaf persons, and enables them to hear distinctly at church and in public assemblies.

A LUNCH BOX.—Some Yankee has invented a "lunch box," which can be folded up without detriment to the pie and cake contained therein. A company is being organized to manufacture the boxes, at the rate of 10,000 a year, in Connecticut.

HOW TO SIT.—All consumptive people, and all afflicted with spinal deformities, sit habitually crooked, in one or more curves of the body. There was a time in all these when the body had its natural erectness, when there was the first departure on the road to death. The make of our chairs, especially that great barbarism, the unyielding and disease engendering rocking chair, favors these diseases, and undoubtedly, in some instances, leads to bodily habits which originate the ailments just named, and to say nothing of piles, fistula, and the like. The painful or sore feeling which many are troubled with incessantly for years, at the extremity of the back bone, is the result of sitting in such a position that it rests upon the seat of a chair, at a point several inches forward of the chair back. A physiological chair, one which shall promote the health and preserve the human form erect and manly as our Maker made it, should have the back straight, at right angles with the seat, the seat itself not being over eight inches deep. A chair of this kind will do more towards correcting the lounging habits of youth than multitudes of parental lectures, for then if they are seated at all they must sit erect, otherwise there is no seat hold.—*Hall's Journal of Health.*

CONTRIBUTIONS FOR OUR CABINET.—We have upon our table quite a number of valuable "contributions for our cabinet," all of which we shall endeavor to notice next week.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
June 8, 1887.

## CITY STOCKS.

For months past City Shares have not been neglected to such an extent as during the last fortnight. Mining shares seem to have monopolized the entire range of stock transactions, and under the present easy condition of the money market, we may expect a continuation of this disposition on the part of those who have idle capital. Sales of National Ins. Co. have been made at \$71@71.25 per share.

## MINING SHARE MARKET.

The Mining Share Market has shown unusual activity during the past week; however, with the exception of a few prominent stocks, the decline from our last quotations has been very marked. In the absence of any very decided movement on the part of speculators to "bull" or "bear," the recent appreciation of mining shares has been remarkably well maintained, and it may be remarked that the rise has, in most instances, been based upon favorable developments. This is especially true of those stocks which have not declined within the period under review. The yield from the various claims on the Comstock lode continues large, and, coupled with the constant decrease of expenses, both in the manipulation of ores and general management, will greatly inure to the benefit of the stockholders in the future.

SAVAGE—ruled at very uniform rates during the week under review, opening at \$3,900@3,890, receded to \$3,850, improving to \$4,000, and closing yesterday at \$3,975. The approximate value of the 2,101 tons of ore extracted from the mine during the week ending June 1st was \$84,753, or \$40.34 per ton; the yield of the previous week showed an average value of \$45.85. The north mine, on the seventh station level, yielded nearly one-half of the above amount, and the balance, with the exception of a small amount from the upper portions of the mine, was taken from the middle and southern developments on the same level. The "breasts" at the northwest end of the seventh level are said to be in very good ore, producing a fair amount of first-class quality. In the winze, in the south mine, 160 feet from the line, better ore is now obtained than has been found in the incline at a depth of 105 feet. It is thought that it will require from three to four weeks to make the connection with the middle mine on the eighth level. The shaft, on the first instant, had attained a depth of 20 feet below the fourth or ninth station level. This company disburses a dividend of \$200 per foot to-day, carrying over, after payment of dividend, a cash surplus of about \$100,000.

HALE & NORCROSS—quoted at \$2,800 bid and \$3,600 asked; no sales. During the month of May the mills employed by this company reduced 3,377 tons of its ore, the 65 per cent. assay value of which, at an average yield of about \$43.70 per ton, shows a bullion return of \$147,598.70. The actual returns from the mills show a yield of \$150,826.68, being an average of \$44.66 per ton. The estimated profits of the month, it is thought, will amount to about \$75,000, or a surplus of \$20,000 over the usual monthly dividend of \$125 per foot, which will be declared on the 10th instant.

YELLOW JACKET—has met with considerable sales at enhanced rates, advancing from \$1,750 to \$1,900, seller 30, receding to \$1,800, and closing at \$1,773. A dividend of \$75 per share will be paid on the 10th instant. The bullion yield of this company amounted to \$273,684.63 in May; receipts from other sources, \$10,711.86. On the 31st of May there was a balance to the credit of the company, over all liabilities, of \$152,590.15. The ore extracted during the month of May aggregated 6,940½ tons; amount reduced in same time, 7,546 tons, showing an average yield of \$37.06 per ton.

CROWN POINT—fluctuated considerably, opening at \$1,600, advancing to \$1,800, declining to \$1,660, and at the close sold at \$1,630. During the week ending May 31st 656 tons of ore were raised from the mine. The east body of ore on the 500-foot level has been opened 50 feet north and south, and a slope of 10 feet has been made. The

Rhode Island mill reduced 162 tons of ore from the east vein on the 500-foot level, which, it is said, yielded \$48 to the ton. It is expected that the shaft will reach the 600-foot station by the first of July. The May returns of bullion amounted to about \$82,000. The election for Trustees, on the 4th instant, placed the following new Board in power: Thomas Sunderland, A. Hayward, W. B. Johnson, Charles Bonner and Thomas Bell. Mr. Sunderland was elected President, and Chas. E. Elliot, Secretary, in place of J. H. Jones, resigned.

GOULD & CURRY—has been in slight request during the past week, selling at \$570 @560, then at \$545, and at the close obtaining \$540. The mill of this company has been stopped to allow an accumulation of ore large enough to insure a continuous run of two or three months. It is thought that in the course of four weeks the mill will be again in operation.

CHOLLAR-POTOSI—declined from \$570 to \$540 per share, rose to \$558, receded to \$530, and then to \$470, and closed yesterday at \$495. The Blue Wing level is reported to continue to look well in the south end. We have nothing new relative to the old Santa Fe level. On the third level, 133 feet below the old Santa Fe station, and 365 feet from the surface, a seam of ore three feet wide has been found on the east side of the Chollar timbers, which is said to assay about \$73 to the ton. Some parties are of the opinion that this portion of the mine will produce a large amount of ore. The gross receipts of this company during the month of May amounted to \$334,289.17, leaving a net profit of about \$100,000. It is stated that the monthly dividend will be \$25 per share.

KENTUCK—improved from \$415 to \$490, declined to \$445, and closed yesterday at \$430. This company obtained \$132,333.88 in bullion from 2,390 tons of second class ore worked during the month of May, being a yield of \$59.55 to the ton. During the same period 2,539½ tons of ore were extracted from the mine. A dividend of \$30 per share (\$60,000) will be paid on the 10th inst., after paying which they carry over a cash surplus of \$44,484.

OPHIR—has been largely dealt in at declining rates, receding from \$325 to \$275, and closing at \$235.

BELCHER—declined from \$400 to \$370, and at the close realized \$310. An assessment of \$15 per share was levied on this stock on the 30th of May.

IMPERIAL—has been steadily maintained at about \$200, but at the close declined to \$193@190. The bullion receipts of this company during the month of May aggregated \$94,000.

GOLD HILL Q. M. & M. Co.—sold at \$162.50. The yield of bullion in May amounted to \$10,866.62. . . . EMPIRE realized \$172.50@168, and closed at \$165, buyer 80.

OVERMAN—has been exceedingly active during the past week at greatly enhanced prices, rapidly advancing from \$65, buyer 30, to \$107, under large sales, and closing at \$135. This company under the management of its new superintendent, Mr. McCullough, is looked upon very favorably by stock dealers. It is reported that from 5,000 to 8,000 tons of ore are at present in sight in the mine, which it is thought will yield a handsome profit over mill expenses.

CONFIDENCE—receded from \$70 to \$54, and closed yesterday at \$52. Return of bullion show a yield of about \$17,000 in May. . . . BULLION improved from \$28 to \$50, seller 30, assessment of \$10 delinquent, receded to \$40, and closed yesterday at \$45. . . . SIERRA NEVADA rose from \$7.50 to \$12, and at the close sold at \$10. An assessment of \$10 per share was levied on this stock on the 1st inst. . . . EXCHEQUER sold at \$8.

DANEY—advanced from \$24 to \$30, receded to \$28, and closed at \$26. On the 3d inst., this company took up 60 pounds of amalgam, being the product of 350 tons of ore, which, it is thought, will produce over \$7,000 in bullion.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,721,841.

PAINE & STEVENS' CONCENTRATOR.—In our notice of this machine last week, we were under the impression that the main body of the machine was new. Our attention has since been attracted to the illustrated description of a similar machine in the supplement to Uro's Dictionary, which Messrs. Paine & Stevens have materially improved, and by which improvement, it is claimed, the machine is made much more efficient and serviceable. It is for these improvements that they have applied for letters patent.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Bulletin*, May 25th: The Illinois California Co. have cut a ledge in their tunnel, the ore from which, by a working test, yielded \$60 per ton. When the lode was first tapped, a large body of water burst forth, which still continues, although somewhat diminished in quantity. The lode at the point crossed is pinched, the pay streak being only about one foot thick.

As soon as an ore house can be constructed, the Tarshish will put the Washington mill at work on their ores.

## Amador County.

From the *Ledger*, May 25th: Work has been resumed on the Kennedy mine. It is ranked amongst one of the richest veins in the State. The last crushing yielded \$54 per ton; free gold.

## Calaveras County.

From the *Chronicle*, June 1st: A surveying party of the Mokelumne and Campo Seco Canal and Mining Co. report that they were astonished to find such an extent of rich placer diggings as extend from Chili Camp—running south and west through Camanche—and Cat Camp, down to the plains in San Joaquin county. This belt is some 12 or 15 miles long, by a breadth of 8 or 9, and in every gulch and ravine, on every hilltop and hillside, wherever a prospect has been made, gold is found in paying quantities, and often exceedingly rich. Many of the prospectors find good claims by simply pulling up the grass and flowers on the hills and washing the adhering earth, often getting large prospects on the very surface.

Stockton *Independent*, June 1st: J. Pache & Co. are forwarding machinery for a 40-stamp mill to the Plymouth Rock Co., at their mine in Rich Gulch, near Brushville. Altogether there will be 70 or 80 tons of freight.

From *Copperopolis Courier*, June 1st: The rich strike at Carson Hill, in the Finnegon mine, proves to be more than a pocket. It opens as a regular vein, almost fabulously rich, and has been shown to contain from \$80,000 to \$100,000.

## Colusa County.

From the *Colusa Sun*, June 1st: The shareholders of the Lyon claim, at a late meeting, determined upon purchasing a Haskell furnace. There is no doubt but that the ore is good, and in sufficient quantities to warrant the outlay.

## El Dorado County.

From the *Courier*, June 1st: W. H. Cox, owner of the cement mine, on Texas Hill, has erected a patent cement pan, just invented by J. D. Cox, of San Francisco, which works admirably. He intends to hydraulic off the top gravel, above the cement; the top gravel more than pays for water and wages. One tunnel is in 1,700 ft. There are two cement channels—one about 25 ft. from the mouth of the tunnel. This bed of cement is 250 ft. wide, and from four to eight ft. thick, carrying gold from top to bottom. Competent judges say that the cement now being taken out will run \$5 per ton.

The shaft on the Pacific mine is down 313 ft. At a depth of 298 ft. the ledge was struck, and after going through 15 ft. the west wall has not been reached. The rock is full of gold, visible to the naked eye.

The Independence mine at Brownsville, is proving very rich; the owners are building a large mill. On the Eagle claim there is a 10-stamp mill; the claim pays \$18 per ton. The Stillwagon yields \$16 per week.

The owners of the Miller ledge after running 180 ft., struck the ledge at a depth of 80 ft. The ledge is 18 ft. wide, and gold in large quantities can be seen with the naked eye.

## Fresno County.

From the *Stockton Independent*, June 1st: Machinery for a quartz mill at Coarse Gold Gulch, Fresno county, is being carried forward from this city by Geo. S. Ladd & Bro.

## Kern County.

From the *Courier*, May 25th: A rich strike has been made in the Bright Star lode, Pite Dist. The ledge was struck within three ft. of the surface, and is three ft. wide.

A specimen taken from the Belmont mine, Washington Dist., weighing 600 lbs., will yield about \$1,000 per ton. The owners are about going to work with a new set of arastras.

## Mariposa County.

From the *Stockton Independent*, June 1st: A large quantity of machinery has arrived from San Francisco, to be forwarded to Hunter's Valley, Mariposa county, where a new quartz mill is to be built. It is to be all delivered by the middle of June.

## Nevada County.

From the *Transcript*, May 30th: Stidger, Clay & Evans, Birchville Dist., at their last clean-up, took out \$19,700. The lead has increased to 300 ft. in width. A day or two since they cleaned up five boxes and took out \$5,000. It is thought the next yield will amount to \$25,000.

The San Joaquin Co., after their last run, declared a dividend of \$300 per share. The Golden Gate Co., North San Juan, after the last run, cleaned up about \$5,000.

May 31st: Edward Brimskill, on the ground adjoining Rocky Bar, Washington, after running 600 ft., struck pay dirt. After one week's run he took out \$588. From one pocket he took out 13 ozs.

Between 400 or 500 ft. of the flume on Hawke & Co's claims, on Deer creek, was lately blown down by high winds.

June 1st: Five ozs. of rock from the Green Emerald ledge, at Cisco, yielded \$1 in gold. The mill upon the Jim ledge has started up again.

The Birchville Co., at Eureka, have a ledge in their mine  $2\frac{1}{2}$  ft. wide, and the rock is filled with rich galena sulphurets.

June 4th: Last week the L. X. L. Co., at Woolsey's Flat, after a seven week's run, cleaned up \$10,400. The expense of working the claim during the run was \$4,500.

*Gazette*, May 31st: The Black & Young mill is running steadily. The ledge looks better than at any former period.

June 3d: A rich deposit of cement gravel has been opened at Chapparral Hill. The gravel is cemented so compactly that it can not be worked, except in a mill. Some parties have made arrangements to erect a mill.

Goodspeed & Co. cleaned up, on Saturday last, from a six days' run on 300 tons of cement, \$1,500. Eastern, Preble & Co., on the same day, cleaned up \$1,200. The Green Mountain Co. are running their mill night and day.

June 4th: The claim of Wm. Weighel, at Columbia Hill, employs 23 men, using 1,000 inches of water per day. The tailings below his diggings have accumulated to a depth of 150 ft.

The Kentucky Co. are down 110 ft. The shaft is 15 ft. in length and 5 ft. in width. Water has accumulated in the shaft, rendering it impossible to sink further without the aid of steam. Powerful machinery has been procured in San Francisco. They expect to reach the bedrock at a depth of 250 ft. Another company at Moore's Flat have located claims on the same range.

June 5th: Booth & Co., at Eureka, have been crushing quartz with a couple of stone arastras. The rock is broken with a sledge, and the arastras are fed  $\frac{1}{4}$  of a ton once in 12 hours. The rock crushed has been from the Liberty mine, which yields \$20 per ton. The arastras are not excelled as amalgamators, and are about as economical as ordinary mills.

*National*, May 3d: New and rich quartz discoveries are being made in this region constantly.

June 3d: The Red Jacket Co. have been running a tunnel into a hill on the north side of Deer creek for about a year. About a week since the stockholders held a meeting at the claims, and, after examining the ground, concluded that they had the genuine blue cement lead, a continuation of the Smartsville lead.

Grass Valley *Union*, June 1st: For the first two weeks of the last month the Eureka yielded \$30,000, and for the next two weeks \$31,000, showing a total yield of \$61,000 for four weeks of the month of May. A portion of the ore crushed was reduced at the Sebastopol mill, Boston Ravine, the company's mill at the mine crushing the greater part of the rock. Regular dividends are made every four weeks. The dividend for the last month will reach the handsome figure of \$30,000.

June 4th: The Osborne Hill quartz mill was destroyed by fire on the 3d inst. Besides the mill, 300 cords of wood belonging to the Co. was destroyed, and the hoisting works belonging to W. H. Mitchell & Co. The original cost of the mill was \$25,000. The loss of the company is estimated at \$20,000—no insurance.

*Excelsior*.—From the *Sun*, June 1st: A tunnel has been driven in the Mohawk and Montreal mine 67 ft., but has not yet reached the ledge. Their mill contains five stamps, weighing 625 lbs. each. Five additional stamps will be added shortly.

The California Co. have run a drift in 24 ft. Fine specimens of native copper have been taken out during the last week. Specimens taken out 20 ft. from the mouth of the drift presents the appearance of fern leaves, and can be found in every seam of the rock. It is rich in gold. Their shaft is down 100 ft. The cost of running their shaft and tunnel has been \$20,000.

From  $1\frac{1}{2}$  lbs. of rock from the Green

Emigrant claim, upwards of 60 cts. in gold was lately obtained.

Rock recently taken from the Eagle Co's claims will prospect \$2,500 per ton.

*Transcript*, May 30th: The Grant mine is yielding handsomely. Since last December, their mill has turned out \$18,000. The last yield, after two weeks crushing, was \$2,000.

*Gazette*, June 1st: The Green Emigrant Co. are taking out some splendid ore, which is mostly decomposed. The ledge is about 6 ft. wide.

The Wheeler Co's claim is the second west extension of the Shooting Star ledge, and is one of the finest veins in the district.

## Placer County.

From the *Herald*, June 1st: The Old Rip claim has recently been purchased by Wm. Rouse, of Greenwood. He is preparing to work the mine in a thorough manner. There has been many thousands taken out of the Old Rip, yet it looks hardly touched.

The Rough Gold claim, owned by Davis & Co. has been worked steadily, and is becoming rich.

The old Dewey claim, owned by Breese, Wheeler & Co. is considered the best cement claim in the county. The company could any day take \$100,000 for it. They have a tunnel in a distance of 1,400 ft. There is enough pay cement in sight to keep the mill running three or four years. The owners have monthly dividends which are very handsome, sufficient to make one wish he had an interest in "Old Dewey."

The Green Emigrant ledge has been sold to parties in San Francisco for \$60,000.

## Plumas County.

From the *Union*, May 31st: The Chinamen at Susanville, are extracting buttons of silver from the rock near that place. By their rude assay, the rock yields \$800 per ton.

## Shasta County.

From the *Courier*, June 1st: Several miners recently sunk a shaft in a large flat gulch near Piety Hill. At a depth of 20 ft. they struck a layer of blue gravel, three ft. thick, which prospects exceedingly rich.

## Sierra County.

From the *Messenger*, June 1st: Snow at Gold Lake is 20 ft. deep; miners are unable to work their claims. Fessler, Lewis & Co. have located a ledge on Kanaka creek, which is composed of talcose slate. It is six or eight ft. wide. Bishop, of Alleghany, a few days since, found a small boulder of quartz and gold in his garden, for which he was offered \$400. The ground was immediately staked off in claims. Mr. Allen, while grading a lot for Wm. T. Luther, on Jersey Flat, picked up a piece of quartz rock containing nine ozs. of gold.

## Trinity County.

From the *Journal*, May 25th: About Minersville, claims are paying much better than usual. Several new mining projects are under way. Taylor & Frey are pushing work on their new ditch from Grass Valley Creek. The ditch and flume from North Fork to Honest Bar will be completed soon. Better work is being done in the Weaver-ville Cañon and Judiana Creek, than for years.

## Tulare County.

From the *Visalia Delta*, May 29th: Mr. Brooks, of San Francisco, has leased the White River Mining Co's mill and mines. He will commence operations immediately.

## Yuba County.

From the *Marysville Appeal*, June 4th: The Jefferson claim is undoubtedly one of the best in Brown's Valley. From the Don-nobroge claim over \$200,000 gold has been taken by different owners. Work on it has been discontinued. The Paragon Co., after having spent \$10,000 for machinery and \$1,000 in mining, have abandoned their claim in proud disgust. Work has also been discontinued on the Dan Webster—cause, want of management.

## ARIZONA.

From the *Arizona Miner*, May 18th: The Great Central copper mine, at 100 ft., is a well defined lode. A large amount of ore has been taken out. They are working 25 men.

The Plauet mine is yielding 100 tons per month. The vein has been prospected 200 ft. They work 12 hands.

The Challenge mine has been worked two years, and turned out 500 tons of mineral.

About 35 men are working the old Walker placers on Lynx creek, and taking out \$8 each per day. From the Black Cañon placers we have good reports. A number of parties are at work on the upper Hassayampa, and making it pay very well.

May 18th: The Vulture mill at Wickenburg is in active operation, crushing with 10 stamps about 13 tons a day; 2,000 tons are now ready for the mill. The ore returns an average of \$50 per ton.

About 35 men are working the old Walker placers on Lynx Creek, taking out eight dollars each per day. From the Black Cañon placers we have good reports. A number of parties are at work on the upper Hassayampa, and making it pay very well. The water is everywhere abundant, and will, it is thought, be sufficient for mining purposes during much of the summer.

## COLORADO.

From the *Rocky Mountain News* of May 15th: The Gregory lode shows by test nine to twelve per cent. copper, besides from \$100 to \$250 gold per ton. The Comet lode shows 25 per cent. of copper, gold, \$75 to \$100 per ton. One vein of the Nonpareil Prospecting and Mining Co. assays as high as 65 per cent. copper, besides gold and silver. The Lyon smelting works at Black Hawk, lately produced matt, assaying from \$800 to \$3,000 gold per ton, and from 60 to 75 per cent. copper. Among the lodes found to be rich at Georgetown, are the Anglo Saxon, Bethany, Tom Corwin, Henry Clay, Mexican, Monarch, Terrille and Henry Ward Beecher. Dr. Johnson, from eight ozs. of ore, produced a silver button weighing four ozs.  $2\frac{1}{2}$  pennyweights. Mr. Harris is superintending the erection of a new furnace on a new plan, after the fashion of glass furnaces.

From 1,300 lbs. of ore from the Bethany lode, Georgetown, a silver brick weighing 199.67 ozs. was taken.

May 18th: R. H. Evans who is engaged in hydraulic mining at McClellan Gulch, is exhibiting a specimen of placer gold, and some nuggets of pure gold; he averages \$30 per day to the hand. One nugget weighing 33 ozs. has been lately found.

*Valley News*, May 14th: Messrs. Sherman & Sons, while prospecting for coal about one mile north of town, have struck oil. The indications are such that they feel confident if a good well was sunk and with the proper machinery, that the supply of oil from that place would prove inexhaustible. A gentleman who is well versed in petroleum matters, offers to wager \$2,000 that he can supply Colorado in oil from that spot alone.

*Times*, May 14th: The following transfer of mining property has been recently made. Deed from James Eastman and wife to Andrew McKinney and Willard D. Wheeler, Boston, sundry claims in Gilpin and Clear Creek counties, for \$6,000. Deed from Augustus Z. Huggins and wife, to the Pavonia G. M. Co., of New York, sundry mining claims, consideration \$7,000.

## IDAHO.

From the *Owyhee Avalanche*, May 25th: Rich quartz has been discovered at the head of Purdy Gulch, on the east slope of War Eagle. Pure silver has been taken out of a small seam of the Noonday, near the Oro Fino. The seam is very narrow. A ton of ore has been extracted.

The Lincoln Mill has been rented by Messrs. Ford & Gafford, of the Owyhee Co. and will commence running as soon as necessary repairs can be made.

Burnham & Jackson have finished their contract on the Hays & Ray. Their tunnel—over 400 feet long—taps the Poorman 250 feet below the surface.

The Enterprise arastra, below Ruby, is undergoing repairs, and will commence work soon.

The Silver Cord men are putting a whim over the shaft, which is down over 100 feet. There is much good ore on the dump.

*Idaho World*, May 18: At Pioneer City, water is running in all the ditches except one—the Mountain ditch. Wilson & Waterman have reduced the price of water to 40 cents per inch for 24 hours, or 30 cents if used in day time, and 20 cents if used at night.

Hinchey, Connery & Co., have bought the Wheeler ditch for \$1,500.

*Lewiston Journal*, May 3d: Some rich discoveries of quartz has been made east of the South Fork of Salmon. A tunnel 160 ft. was run in the Quartz Mining Cos. claim at Warren's, and 30 ft. more was expected to tap the vein. At Elk City Valley all the ditches were running full, and everybody is at work.

*Idaho World*, May 25th: A clean-up in the claim of Devine, Ellis & Co., on Granite creek, amounted to nearly \$10,000, after four weeks run. The claims of the company are extensive. The bed rock is not more than 10 ft. below the surface. There are about 300 men employed in the district, and they make \$30 per day to the man.

In a short gulch two miles above Walla Walla Flat, I. M. Johnson, after four weeks run, cleaned up over \$1,900.

Edmonson & Smith, at their first clean-up, realized \$1,000. P. B. Smith, on East Hill, made a clean-up of \$2,000. Sanders, Lindsay & Co., on Buena Vista Bar, have done equally well.

## MONTANA.

From the Montana Post of May 18th: Prairie Bar, one mile below Hoggins, is found to be very rich. It is two miles in length, and from 800 to 1,500 ft. in width. From 10 to 15 cts. per pan can be had in the grass roots, and from 10 to 50 cts. in the gravel. Several nuggets have been found weighing from \$15 to \$50.

At Highland, Packard's claim recently turned out a splendid nugget, weighing over \$340. Hiffner & McConn's claim gave its owners a beautiful specimen weighing \$115, and Campbell & Berkley's claim (Horse Gulch, a tributary of the Highland,) presented its fortunate owners with a nugget of about \$200.

Louis Burgher has discovered some 20 ledges 35 miles from Diamond City, in a S.E. direction.

One ton of dark-colored ore from the Andrew Jackson assayed at the rate of \$542.19 per ton in silver; while one ton of light-colored ore yielded \$158.34 silver and \$36 gold. The Benton lode yielded at the rate of \$245.05 per ton of dark-colored ore.

The Ballarat lode, at Highland, assays, on an average, \$140 per ton. The ledge is 47 ft. wide at a depth of 40 ft. on No. 3 north; and in the various tunnels and shafts varies from 28 to 47, according to the depth they have reached. There is scarcely a doubt that this lode is a second Comstock. Pope, Patton & Co. are putting a bed-rock flume in Alder gulch 2,000 ft. long. The company eluding on Pat McGovern's claim cleaned up, on Saturday, \$1,543 for six days run with four men.

Turnley's mill, in Grizzly Gulch, cleaned up 225 ozs. of retort after a six days run on Whitlatch Union ore.

## EMERALDA, NEVADA.

From the Esmeralda Union, May 25th: The new Philadelphia Reduction Works are rapidly approaching completion. The works are enclosed by a building 30x60 ft. The machinery is of the most approved kind.

The Juniata mine is again being worked. The shaft is progressing finely, and will soon be below the old works, where a large body of fine ore was left.

Two bars of ore are to be seen at Ruhl's & Co's assay office. They are the result of a crushing of 100 tons of ore from the Wilson lead, Pine Grove. One contains \$1,797.31, the other \$1,745.82. The fineness of one is .915, the other .891; value of both, \$3,543.14; yield per ton, \$35.43.

## PAHRNAGAT.

From the Salt Lake Vedette, May 25th: The editor is informed that 1,500 ft. in the Lela and Jessie lode, was lately sold in New York at \$25 per foot and the purchasers at once started machinery for that locality.

## REESE RIVER.

From the Reveille, May 27th: The Combination Co., of Silver Bend, have commenced grading for their mill. A spring half a mile from the mill, will furnish sufficient water. The water will be carried in iron pipes to a reservoir of 200,000 gallons capacity. The mill will have a battery of 40 stamps, one-half for wet ore, the other for dry.

The Keystone mill has been repaired and is now doing more effective work than ever. The mill is well supplied with ore.

Samples of peculiar looking ore from the Fisherman ledge, Reveille Dist., has been exhibited, which bears a marked resemblance to that obtained from the deeper workings of the Highbridge and Transylvania in Silver Bend. The ore is rich in deep colors, which are beautifully blended. The Fisherman is opened through an incline 40 ft. deep, at the bottom of which the vein has increased in size, and is now fully nine ft. thick. The ore is uniformly high, ranging from \$500 to \$700 per ton.

Silver Bend Reporter, May 25th: Ore taken from the Eagle and Magnolia ledges, Morey Dist., 15 miles north of Hot Creek, assays many hundred dollars per ton. Choice specimens give about \$750, while average pieces show about \$150. Several tons of ore have recently been worked at Austin, but with what result we have not learned.

The mill of the Twin River Co., which has been idle for a short time, is again at work.

Specimens of ore from the Oregon is so nearly like the Transylvania, that none but a connoisseur could detect the difference; the vein is 18 to 20 in. wide at the surface. The Colorado is about five ft. thick and the surface ore has been tested in an arrastra and gave a yield of \$160 per ton.

[Additional items from this District may be found on page 366 of this paper.] Humboldt.

Trespass, May 30th: The Montezuma is the principal mine in Trinity Dist. The lode has been worked to a depth of 18 to 25 ft. on the line of the ledge, with 24 ft. face.

About 15 tons of ore are extracted daily. Two tons of the ore yields 2,400 lbs. of bullion, or 60 per cent. metal.

The Alameda Co. have the machinery on the ground for an 8-stamp mill, which is to be erected and put in running order at once. Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Trespass, May 28th: The Imperial and Empiro Co., have commenced work on their new hoisting works. The front wall will be 165 ft. long, 5 ft. wide at the bottom, and 2 ft. on the top, and 8 ft. high. The balance of the foundation will be 3 ft. high and 2 ft. thick; there will be a crib built around the shaft 4 ft. thick and 8 ft. high, raising the shaft on a level with the front wall, making it a part of the shaft proper.

The Yellow Jacket Co., have completed the foundation for the new engines, recently built at Marysville. They will be put in position as soon as they can be transported over the Sierra. The fine Corliss engine now in use will drive the pumping machinery.

May 30th: The Illinois Mill is now at work, crushing 30 tons per day.

The Gold Hill correspondent of the Flag of this city, writes: The shaft on the Imperial and Empiro is down 900 ft., at which point they will run a drift to the ledge.

Enterprise, May 28th: Work has been resumed on the old Sacramento Claim, Cedar Hill. Already 60 tons that will pay from \$75 to \$100 per ton has been taken out. Steele & Rennie have leased Weston's mill, on Gold Cañon. Also 150 ft. of the Sacramento Co's ground. They will take out 15 or 20 tons per day. The Pcytonia contains the same quality of ore as the Sacramento. Several pieces from the dump, were filled with particles of free gold. The bullion is worth \$15 per oz. The Sacramento contains 3,000 ft. of mining ground.

June 1st: At the Gold Hill mine ore is being hoisted from the 380-foot level, also from the 150-foot level, of a quality superior to that taken out last month. The yield will be at least 30 per cent. greater this month than last.

The Petaluma Mill Company have purchased of the Savage Company two large hoilers, each 34 inches in diameter and 16 ft. in length, and each containing 36 flues.

The Sierra Nevada Co. are still engaged in putting in their pumping machinery.

The Chollar-Potosi Co. are now taking out from 350 to 400 tons of ore per day.

June 2d: The hoisting works used to do the hoisting in sinking the new shaft of the Imperial and Empiro, have been torn away to give place to the new works in course of erection. A large force of men are clearing away the old rubbish, laying the foundation for the new works, and framing the building. The large Cornish pump of 300 horse power will be placed in the new works. The cylinder of this engine is 42 inches bore and 12 feet stroke. It is calculated the capacity of this pump is sufficient to free all the mines of water from the Yellow Jacket to the Bullion. The new shaft of these companies being 100 ft. deeper than any other in Gold Hill, will drain all the mines in the vicinity to a level with itself.

During the past week Wells, Fargo & Co., shipped 12,088 pounds of assayed bullion, valued at \$357,855.86.

From Enterprise, June 4th: The Yellow Jacket company has just declared a dividend of \$75 per foot, payable on or after the 1st inst., at the Bank of California, in San Francisco.

## UTAH.

From Salt Lake Vedette, May 25th: The editor saw the result of seven pans of dirt washed out of Brigham Cañon. He says: The gold looks rich, and some pieces are of good size. Rich gold and silver bearing quartz are known to exist at the head of the cañon. The only damper on its future is, that it is too near the city, only 25 miles. We are going to visit it ourselves, after a hit, when we can muster cheek enough to beg or borrow somebody's "broncho" and a week's "grub."

## OREGON.

From the Oregon City Enterprise, May 25th: Quartz of exceeding richness has been discovered near White Bluffs. The exact location is as yet kept secret.

A piece of quartz has been found in Jackson county which weighs 140 ozs. It is expected to yield 100 ozs. of gold.

The Jacksonville Press says that \$6 or \$7 diggings have been discovered at the head of Jack's creek. The diggings are some two miles in extent. Other diggings have been struck near the head of Applegate. The discoverers were Chinamen, one Celestial having picked up a piece of gold weighing 14 ozs.

## The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 338.]

## TWIN RIVER DISTRICT.

Is situated on the eastern slope of the Toiyabe, fifty-five miles south of Austin, in about latitude 38 deg. 48 min. This district was first discovered by a Frenchman named Boulrand, who first wandered here early in 1863, and remained secluded and alone for over twelve months, packing in his provisions from Austin by night to prevent others from discovering his locality. Here he worked by himself alone in what was then one of the wildest regions of Central Nevada, performing an astonishing amount of labor for one so situated. He seems to have been impressed with the idea that vast wealth was hidden in the ample breadth and depth of an immense quartz lode, which he still owns, and on which he has applied most of his labor. This lode is called the Ophir, and is gigantic in size. Where the cañon cuts it, it is fully forty feet wide, giving a sectional view, rising nearly perpendicular sixty or seventy feet. But, notwithstanding its great size, it is not the "big thing" of Ophir Cañon. On one of Boulrand's trips to Austin, he confided his secret to a countryman of his, who, in turn, exposed it to Murphy, whose name the famous lode of the district bears. The latter, with a small party, followed the Frenchman here sometime in June, 1864, and, by closer observation, discovered that one of Boulrand's locations, situated a half mile further up the cañon, was immensely rich. This being unsuspected by Boulrand, the Murphy party took immediate possession of it, and when its value became apparent to the Frenchman, litigation followed, and he eventually recovered, by compromise, \$4,000.

In the summer of 1865, R. B. Canfield, then fresh from the Atlantic States, was drifting about among the rocks and shoals of those speculative days, when good fortune guided him to Ophir Cañon. Here he purchased the Murphy and parallel lodes for \$50,000 in coin (the original owners reserving one-fifth of the unassessable stock in mine and mill). Extensive preparations were at once begun for opening the mine in the most thorough manner, also for the construction of the most extensive reduction works yet built in Central Nevada. The mill is built of granite and brick, with the capacity of forty stamps; however, but twenty are yet in operation. Its cost can not have been less than \$250,000 with other improvements. This work, considering the inaccessible locality and the consequent enormous expense of getting material to it, stamps the originator as a person of remarkable energy. The mill is located two and a half miles above the mouth of the cañon, at an elevation of 1,800 feet above the valley, and to make this two and a half miles passable for wagons, \$8,000 was expended. The nearest material suitable for brick was seven miles below, in Smoky Valley, the brick costing \$40 per thousand delivered at the mill. All the lumber was hauled over thirty miles, and a large part over 200 miles, costing from \$100 to \$250 per thousand. The works were completed in September, 1866. By that time the mine was in condition to constantly supply them with ore, and the success of the mill has been unparalleled since. In less than two months after starting, over a ton of silver had found its way out of Ophir Cañon into the channels of commerce. The last quarterly returns have been given me as follows: 800 tons of ore, yielding at the rate of \$128 per ton, giving a total yield of \$102,400, or a monthly yield of \$34,133. On the completion of this mill, 1,400 tons of ore lay on the dump, and the ore is mined with such facility that the quantity has been but little diminished since. The enclosing rocks of the mine are granite on the east and greenstone slate on the west. Its greatest width appears to be about twenty-four feet of vein matter. It has an easterly inclination of about 40°, and the pay ore lies near the east or hanging wall, in a section from two and a half to five feet wide. The ore is in considerable variety, the major part appearing to be an extremely rich antimonial sulphuret, thickly mottled with stephanite, or brittle ore of silver. The ore is stained in the seams with light yellow, slightly tinged with green, indicating the presence of both lead and copper. Nearer the surface, very rich chlorido of silver, highly colored with green and blue carbonates, occur; also considerable native silver, in thin flakes, or leaves and

wires. The lode crops out only on the north side of the cañon, and can be traced a long distance in that direction, which is about magnetic north. The possession of the croppings on the hillside, however, would show the true trend of the lode to be several points east of north. The present works on the mine are near the south line of the company's claim, the McDonald Co. claiming south from the center of the cañon. It has been determined, from the lower level of the Murphy, that the rich ore extends to the McDonald ground, and preparations are in progress for extensive development by the latter company.

From the mill up to the summit (by the trail leading to Lone, which is eighteen miles due west), the last mile and a half of the two is very steep. The mountain is of slate and syenite. Near the summit several veins of moderate size occur in syenite, the predominating ore of which is a highly argentiferous galena. At this point, on the west slope of this range, a long ridge reaches down into Reese River Valley to within a few miles of Bramber's Station, and it is proposed to construct a grade over the Toiyabe here. This will make the most direct route from Virginia City to the rich section of Nye county lying east of the Toiyabe. Leaving the overland route at White Rock Station, the road makes a very slight detour to the south in passing through Mammoth; thence the road will run straight to Charnock's Pass, between Northumberland District and Silver Bend; thence on through Hot Creek to Reveille and Pahrnagat. It is claimed by advocates of this route that a saving in distance is gained over the old route via Austin and the Reveille Ranch of fully sixty miles, which I think is not far from true. The elevation of the mountains here makes this route objectionable for winter travel, as snow will be liable to obstruct it for short periods of a day or two at a time. In view of this, and for the accommodation of the mining section further south, another route, or branch, is now being opened. This starts from the overland route at the same point, diverging at Ellsworth, Mammoth District, whence it takes a southeast direction for thirty miles to Cloverdale, which is at the southern extremity of the Shoshone and Toiyabe ranges; thence easterly and northeasterly around the Silver Bend Range to Belmont. The distance in traveling to the latter place is only about fifteen miles greater than by the Ophir Cañon route, while the country traversed is comparatively level, and avoids all the mountain ranges, and is also free from sand, with the exception of a short stretch between Indian Springs and Belmont. This can be and I understand will be avoided, by striking northeast after leaving Cloverdale and passing through Manhattan District, which is situated a few miles south of Belmont. Notwithstanding much has been said to the contrary, this road does not make a deflection to the south of more than twenty miles in passing to Belmont and vicinity, and it must be fully fifty miles shorter than the northern route via Austin. I trust the serenity of the Reese River Reveille will not be disturbed by this bit of retaliation in kind. If they will refer to their issue of March 6th, they may find where they departed from their usual reliability in a bitter editorial, headed "Asking for Mail Routes," in which they charged one of the few faithful in a not very exemplary legislative body with selfish motives, for endeavoring to secure a just and much needed demand of his constituents, which was nothing more than asking for the establishment of a mail route, by which the residents of Union and Mammoth Districts could receive their California and steamer mail matter without its having to go 105 miles out of the way via Austin. Now, if the Reveille will keep its feathers unruined, the examination of a few more districts will bring us to Austin, from whence we propose to take the reader through Northumberland and Silver Bend, and on through Hot Creek to the "Great East"-ern part of Nye county "and Reveille," where we will compromise the matter by at least a column of the Press given to a description of what we see in that justly "famous district."

Eastward, or down the cañon, from the Murphy mine and mill, the road winds down a narrow chasm, with walls of granite rising abruptly in many places to the height of several hundred feet. Alongside the graded road, the bed of the cañon is occupied by a fine stream of water, that is lashed into foam as it dashes down on its short career to sink into the arid plain of Smoky Valley. The first cañon south of Ophir is called Last Chance. Several locations have been made upon this, but no work is being done on them at present. Two and a half miles north of Ophir we come to Wisconsin Cañon. Here a number of lodes have been located, which are said to promise well.

[To be Continued.]

## Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

G. W. H. SMITH, W. B. EWER, A. T. DEWEY.  
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 24 floor.

**Terms of Subscription:**  
 One copy, per annum, in advance, \$5 00  
 One copy, six months, in advance, 3 00  
 For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Agent Wanted!

A FIRST CLASS CANVASSING AGENT (none other need apply) can secure permanent employment and make \$30 per week and expenses, or better, by applying to DEWEY & CO., Mining and Scientific Press Office, 505 Clay street.

## San Francisco:

Saturday Morning, June 8, 1867.

## Notices to Correspondents.

**CURIOS.**—Palladium was first discovered by Wollaston in 1803, and was originally announced to the public by an anonymous handbill, which was circulated in London, describing its properties, and stating that palladium, or new silver, was on sale at Mrs. Foster's. The secrecy thus observed was the means, as noticed in our publication of the 25th ult., of influencing Chenevix to abandon chemistry. Chenevix, from the mystery observed, was induced to infer that the alleged discovery was an imposture. Acting on this impression, he went to Mrs. Foster and purchased all the palladium in her possession, and set about examining, under the supposition that it was an alloy of some two known metals; and after several laborious experiments, felt convinced that he had ascertained the asserted palladium to be a compound of platinum and mercury, or an amalgam of platinum, made in a peculiar manner. These opinions were embodied in a paper, which was read by Dr. Wollaston, the then Secretary of the Royal Society, at one of its meetings, and afterwards published in its transactions. Soon after this publication, another handbill was circulated, offering a considerable price for every grain of palladium made by M. Chenevix's process, or by any other process whatever. No person appearing to claim the reward thus offered, Dr. Wollaston, about a year after, in a paper read before the Royal Society, acknowledged to having been the discoverer of palladium, and described the method by which he obtained it from a solution of crude platina in aqua regia. It is supposed that Chenevix inadvertently experimented with a solution of palladium, in place of, as he supposed, a solution of his amalgam of palladium, thus mistakenly applying the properties of one to the other. Dr. Wollaston, to his intimate friends, always emphatically declared that he did his utmost to induce Chenevix to withhold the publication of his paper, short of betraying his secret; but C. persisted in the accuracy of his deductions. Had Dr. W. anticipated the loss which science would have sustained in Chenevix becoming satisfied of his error, there can be no doubt but Dr. W. would have fully explained his discovery. The moral to be derived from this history is, that where no practical benefit is to be obtained from secrecy, mystery should invariably be avoided, as evil consequences may arise from it in the most unforeseen and not unfrequently in the most extraordinarily indirect manner.

**A YOUNG EXPERIMENTALIST.**—All pure aërial hodies expand and contract alike, thus differing from solid ones, each variety of which has its own special degree. It has been ascertained by Dalton and Gay Lussac that one thousand measures of dry air, when heated from the freezing to the boiling point of water, increases in bulk 375 parts. Air, therefore, at the freezing point, expands 1-480th part of its bulk for every degree of heat on Fahrenheit's scale—that is, 480 cubic inches at 32° becomes 481 at 33° and 482 at 34°, increasing one cubic inch for every degree. A contraction takes place for every degree below 32°; thus, 480 cubic inches at 32° diminishes to 479 at 31° and to 478 at 30°. The volume of air, therefore, at 32° would be doubled at 480° and tripled at 960°—the latter being about a dull red heat. Dry steam is subjected to the same law of expansion.

## Commencement Day.

The regular annual Commencement exercises of the College of California, took place at the College building in Oakland, on Wednesday last, and were observed with the usual ceremonies and *clat* which attend such exercises at our Eastern colleges. The day was as propitious as nature could provide, and the attendance and interest manifested was most encouraging for the future of this growing institution of learning. Among the distinguished gentlemen present was Gov. Low, Senator Cole, Gen. McDowell, Prof. Silliman, and many others from different parts of the Pacific coast, more or less prominent in the various professions. We have no space for a detail of the exercises; suffice it to say that they were all most highly satisfactory.

The commencement exercises were conducted by acting President Willey. Marcus Phillip Wiggins, of Oakland, and William Gibbons, of Alameda, were the only graduates. The first honor was taken by Mr. Wiggins and the second by Mr. Gibbons. The highest mark for class exercises is 5.00; Mr. Wiggins stood 4.55, Mr. Gibbons 4.29—both being well up in scholarship. Each performed well his part in the usual graduating exercises. It may be interesting to state in this connection, that not more than three or four persons ever reach the highest grade of 5.00—Rufus Choate was one of that small number.

The commencement oration by Prof. Silliman was excellent and eminently practical. His subject was mainly Practical Education, and he urged with great force and eloquence the necessity of educating the masses up to the needs of the day—of fitting them to be thoroughly, and in the highest sense practical. The effort was worthy of the national and world wide reputation which that gentleman has attained.

The honorary degree of Master of Arts was conferred upon Freeman Gates, Rev. James Wylie, George Tait, Frederick M. Campbell and Henry Hildebrand. The degree of D.D. was conferred upon John Chittenden, of London, England.

## THE ASSOCIATED ALUMNI EXERCISES

Commenced with an oration by Rev. Dr. Stone, of this city, who took for his theme the Relations of the College to the State. The effort was eloquent, ornate and elaborate; it was conceived and pronounced in the style and manner so characteristic of this eminent divine. The prospects of the future greatness of our State were most glowingly pictured, and its educational and practical progress set forth with an eloquence rarely equaled.

A poem written for the occasion by Frank Bret Harte, of this city, was read by Rev. Dr. Stebbins, and most enthusiastically received by the crowded audience.

The festival in the evening was, as it always was and ever will be, sumptuous, unique and felicitous in the extreme—a genuine feast of reason and most copious flow of soul. This cosmopolitan association of *litterati*, is a genuine California idea, and a most happy conception. It is just what we wanted here; It is applicable no where else; it is *unique* in character. Its beneficial influence in behalf of the cause of learning and science on this coast, is already felt and acknowledged. It will grow with our growth and increase with years, until beneath its kindly shadow it shall have matured into strength and fulness a galaxy of indigenuous *alumni*, which will constantly shine forth as local stars, until our whole western coast and vast interior shall be dotted with seminaries of learning, each with its own *alumni*, to pay their annual pilgrimage to their *alma maters*—then, it may be, that the Associated Alumni of the College of California will have gradually lost its anomalous character, and become as such institutions elsewhere—*indigenous*, instead of *associated*.

## AN IMPORTANT CONSIDERATION.

We cannot close this brief notice without urging upon the people of this State the great necessity and importance of supporting our own institutions of learning, in

preference to those of other States and other countries. There is a fact, of both social and political bearing connected with this suggestion, which is too little thought of by people everywhere. There is no calculating the loss to any State from the foreign education of its young men. The warm and generous associations of youth, the memories of their early friendships, ever center around their *alma maters*, and, as a necessary consequence, more or less around the State or people where they have received their college education. Their future impulses and influences will ever, through all their after lives, be more or less imperceptibly and unconsciously influenced by those early associations. When we send our sons abroad to be educated, we are wasting the life-blood of the State—we are making her most valuable citizens more or less alien to her interests and to her glory. Let Californians think of this matter, and weigh it well; let us have the same State pride in this that we do in many other things of far less moment, and in supporting our own colleges thereby more zealously guard the dearest and most holy of our privileges as a State.

## The Bulkhead.

We have received a pamphlet entitled "Specifications for building the Sea Wall along the Water Front of San Francisco," determined upon by the Board of Harbor Commissioners. It proposes that a channel sixty feet wide at the bottom, be excavated. The foundation of the sea wall, consisting of an embankment thirteen feet in width at the level of mean low tide, will be built in this channel, and the stones, previously broken, will be thrown in promiscuously, beginning on the center line, and allowed to settle until they produce a firm foundation, when a body of concrete, two feet thick and ten feet wide, will be laid upon this embankment, and the wall built upon it, constructed of solid masonry. The wall, proper, will be seven feet and three inches wide at the bottom, and nine feet eight inches in height. It will be vertical on the land side, and on the harbor side there will be a batter of two inches to the foot for seven feet and eight inches, where there will be an offset of two feet, forming a recess for the purpose of receiving the end of the timbers for a wharf. The top of the wall will be four inches below the official grade of the city. The face of the embankment on the harbor side will be protected by a rip-rap wall, of which no stone will weigh less than 500 pounds. The wall will extend from North Point to Rincon Point, including the China Mail Co's wharf. The work will be undertaken in sections, and will be proceeded with as fast as circumstances will permit.

True it is proposed to erect a sea wall around the entire front of our harbor which will defy the elements, and be not only a source of gratification, to know that such a wall protects our front, but will be of great commercial value. While our citizens are adorning and arranging the interior of the city, it is right and proper that the city approaches and surroundings be made not only ornamental, but substantial and enduring. The approach to our docks to-day presents an uninviting aspect; but with the proposed sea wall, partitioning the city from the bay, all this will be overcome, and the approach rendered more pleasing and satisfactory.

**APPOINTMENT.**—Dr. A. Kellogg, of this city, has been appointed Surveyor and Botanist to the Government party to be sent up on the revenue cutter Lincoln, to take formal possession of the new Russian purchase and establish custom house regulations in that Territory. Dr. K. and party will not probably be able to remain there more than eight or ten weeks; and of course will be unable in so short a time to make any extended explorations. The Doctor's industrious and observing habits will, however, even in the short time allowed, enable him to collect much interesting and valuable information with regard to the botany, topography and agricultural value of the country. Particular attention will be paid to its timber resources. The party will start another expedition in about six weeks.

## The Prize Essay.

The annals of San Francisco, although limited in years, are prodigal in instances of liberal contributions toward benevolent and useful objects; and not the least among such praiseworthy acts, is the offer of the Mechanics' Institute of a liberal prize for the best essay on the resources of the State, which shall include also useful and practical suggestions for their development. Rumor has it that the sum of \$1,000 is set apart for this purpose. Considering the fact that this Association is made up chiefly of that portion of our population which is not overhurdled with pecuniary means, the sum is most liberal, though not what it should be to call into active exercise the right class of minds to produce such a book as is desired upon such an important subject.

There is another organization, however, in this city, which more particularly represents its wealth, as the Institute does its energy and enterprise, the members of which would be infinitely more benefited by the good results which it is expected will flow from the production and extensive circulation of such a work; and some crude intimations have been thrown out that that Association would also come forward in aid of this praiseworthy enterprise. If the Chamber of Commerce should conclude to add a like amount to that offered by the Mechanics' Institute, the two sums, with the incidental gain which might be derived from a very small tax, over and above the actual cost of publishing the work, would probably be considered an inducement sufficiently liberal to set quite a number of our best minds at work upon the much-needed production. Taking into account the relative advantages which would accrue to the membership of the two associations, and their comparative pecuniary ability, together with the manifest inadequacy of the sums named, to the proper accomplishment of the end desired, we hardly see how the more wealthy organization can withhold its active assistance from the contemplated object. It should be borne in mind, in this connection, that any considerable addition to the price of the book, over the actual cost of its printing and binding, would defeat the main object of its production, which should be to secure for it the widest possible circulation; hence, its author must rely for his compensation almost or entirely upon the premium offered. The price named, even if materially increased by the contingency referred to, would be but small pay for the time, labor and pecuniary outlay which must be involved in the work; especially when we take into consideration the fact that but one out of the numerous contestants could realize at all.

It is highly important that whatever is done should be done quickly. We understand that the Institute has nearly completed its plans, and will soon make its official announcement. It would be well, if conjoint action is to be had, that both announcements should go out at the same time, or nearly so.

What should such a work be? This question will be more fully answered at another time; suffice it for the present to say that it should be a well-written, succinct treatise, embracing comprehensive, statesmanlike and economical views as to the best, speediest and most profitable mode of practically developing the resources of our State. It should be such a work as would present to the people of foreign countries, and to the emigrant just arrived upon our shores, a clear, distinct and truthful account of the extent and character of our varied resources. It should be eminently practical in its suggestions—not visionary or theorizing; and particular attention should be paid to distinctness and terseness. It should be compressed within a compass of from 300 to 350 large duodecimo pages, in long primer type. Such a volume would best secure the attention of the class of people sought to be instructed and influenced, while at the same time it would afford ample space for a really talented writer to sufficiently enlarge upon all topics important to be considered. Ten or twelve months, at least, should be allowed for the different competitors to prepare their work. Those who have the preliminary management of the matter in charge cannot be too careful in selecting for the final adjudicators of the merits of the respective essays, which may be offered, that such only shall be appointed as are well known for capacity, honor and integrity, and each as would instinctively shrink from anything like favoritism. Such a committee should also be so selected as to present, in its whole, a fair amount of technical knowledge upon the various topics which are to be considered in the proposed essay.

## The Pacific Oil Works.

NUMBER TWO.

## IMPROVEMENTS INTRODUCED.

The most difficult process of the manufacture of oil, is the proper application of the heat required in the different processes. But little is necessary; yet that little must be uniform and under the most perfect control. The first application of heat is during the grinding process, under the heavy stone wheels. This has generally been done by placing a furnace under the grinding plate; but Mr. Bruner has substituted steam, constructing the plate much after the manner of the bottom of a mining pan, with a steam chamber. By this means the desired uniformity and control is most fully attained. The chief object of heat in this stage of the progress, is to coagulate the albumen contained in the seed, which otherwise would hold in such close embrace a portion of the oil, that even the immense pressure of 600 pounds to the inch would not separate it. The oil is also thereby rendered more limpid, so as to flow more readily from the press. This application of steam heat is an important improvement over the use of dry heat.

The next application of heat is in the boiling, to which the oil is subjected immediately after being expressed. This is done in large, square iron kettles, made of boiler iron, holding 800 gallons each. The heat is applied by a coil of steam-pipe, reaching from the bottom to the top of the boiler. This, also, was formerly done by dry heat from a furnace under the kettle, and to a manifest disadvantage from its unequal distribution through the mass of oil. Perhaps the most important improvement introduced has been in this connection. In addition to the mode of heating here employed, Mr. Bruner has also devised a peculiar form of stirrer, which establishes and keeps up precisely the motion sought to be established in a mining pan, where every portion of the mass is successively and repeatedly brought under the mullers; the same kind of action and motion is here established, and by it every particle of the oil is thrown up from the bottom and center of the kettle, and from within the coil, over which it passes, down again on the outside, and thence again under the stirrers and upward. This action keeps up a constantly uniform temperature through the whole mass of oil, and produces just the kind of agitation necessary to attain the desired chemical action. The object of this boiling is to increase the siccative or drying property of the oil. To still further increase this change, from five to eight per cent. of litharge is added to the oil while boiling, a large portion of which is dissolved, or forms a chemical union with the oil. In many manufactories various substitutes are used for litharge, such as oxide of manganese, oxide and sulphate of zinc, magnesia, barytes, etc. It being the object of this concern, however, to establish an unexceptional reputation for the character of its products, no adulteration is allowed in any part of the manufacturing operations. The entire combination of processes by which this mill is operated is covered by four patents, held by Mr. P. B. Bruner, the Superintendent, and Mr. Charles Moore, and still another patent is about being applied for. This mill and machinery is a perfect model for excellence of workmanship, convenience and economy of operation and perfection with which it accomplishes its work, and preserves, in its best condition, the product of its manufacture. This latter forms no small item in the value of its productions, as even very slight variations of temperature and other exposure are liable to very materially affect the products.

## OIL CAKE.

The refuse left after the expression of the oil is known as "oil cake," and is an article of great importance to the agriculturalist, being extensively employed in some countries as a food for stock. It is said to greatly improve the condition of the animal which is fed upon it; giving to the hide and hair a smoothness and glossiness of coat unattainable by any other means. Great care is taken at this establishment to keep the cake perfectly sweet and pure; the rooms where it is stored are high, dry and well ventilated, thus preventing the appearance of moist or mould. Oil cake is not appreciated in this market as it should be for feed, although it is largely used in England. In addition to the great quantities of home manufacture there, from 50,000 to 60,000 tons are annually imported, chiefly from India. A considerable quantity has already been shipped to Liverpool from these works, where it commands over \$50 per ton, while it has been offered in this market at \$30, and a superior article to that generally found in Europe. The cake is usually sold as a meal, being broken up and ground fine in a suitable mill, in which condition it much resembles Indian meal. Our lively stable men and others would do well to experiment a little with this feed. A small quantity given to an animal each day can scarcely fail to be advantageous, and, in proportion to the nourishment which it contains, will certainly be found cheaper than any other food.

## IMPORTANCE OF THE ENTERPRISE.

These works are now in the full tide of successful operation, and have added a most important branch to our manufacturing industry. If our agriculturists will only take proper advantage of the facilities they offer them to vary their products, they will soon tell most advantageously upon the State, and lay the foundation for a branch of industry which shall scarcely be second in commercial importance to any agricultural product on this coast. The demand for vegetable oils is increasing everywhere throughout the world. That supply is now chiefly derived from the East Indies; but the skilled labor and improved machinery which can be brought to bear in this country, both in the field and in the mill, is more than a match for the cheap, unskilled labor by which these oils are produced in the semi-barbarous countries of Eastern Asia; while the remarkably favorable semi-tropical climate of California and her rich and virgin soil can nowhere be excelled in either the quality or quantity of the productions under consideration. California might be made to supply the world with the chief portions of the vegetable oils. If she does not, the fault will be her own, for nature has especially constituted her for such production. With her oil, her corn, her wine, her precious metals, and almost all other things which she can readily add thereto, what may not be her future?

**PREMIUM LIST.**—We are in receipt of copies of the premium list of the State Agricultural Society for 1867. The premiums are more liberal than ever before offered, especially for agricultural and manufactured products, and for agricultural and mining machinery. This is as it should be, and it is hoped that the coming Fair will be a true and fair showing of the material prosperity and abundant resources of the State. A limited number of copies of the pamphlet can be had, by those more especially interested, by calling at this office.

**HOME CURED MEATS.**—An evidence of the growing appreciation felt in home productions, may be instanced in the fact that Mr. W. K. Deitrich, of the Washington Market, has been compelled to open out a triple stall for the accommodation of his increasing business. He spread a free, bounteous and flowing table for his friends and patrons on Saturday last.

**JACOB SEW,** Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is, taking to perfection. 16v14tr

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by  
D. H. WOODS,  
16v14tr  
No. 23 Third Street.

**SOMETHING NEW ON THIS COAST.**—Dr. H. A. BENTON has purchased one of Masse's Patent Electric machines, with a powerful Battery, and so connected with a bath that the electric currents can be directed to any part of the system, or make local applications to either. This kind of bath is doing miraculous things at the East, and the Medical Faculty are compelled to admit its utility—for many diseases which defy skill in medicine. We can play upon the nerves as readily as the fiddler can play upon his instrument, dispelling pains, and with proper chemicals can extract mineral and other poisons from the system. With this Bath, and the Hot Air Medicated Bath, with its kindred applications, all diseases, curable, can be relieved very soon. The public are invited to call and see the facilities of our establishment, at No. 314 Bush street, adjoining Russ House, from 9 A. M. to 8 P. M. 23v14-11

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1v  
AUSTIN A. WELLS, Agent.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.  
Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

## Perry Davis' Vegetable Pain Killer.

Importance of having Davis' Pain Killer always on hand. Wonderful cure of the Rev. D. L. Bratton, Missionary in India, who was stung by a scorpion. Extract from his letter, published in the Baptist Missionary Magazine:  
"For the first time since I have been in India, I have been stung by a scorpion. I went out this morning to my exercises, as usual, at early dawn, and having occasion to use an old box, on taking off the cover I put my hand on a scorpion, which immediately resented the insult by thrusting its stinging into the palm of my hand. The instantaneous and severe pain which darted through the system is quite incredible; what an awfully virulent poison their sting must contain! I flew to my bottle of Davis' Pain Killer, and found it to be true to its name; after a moment's relief, I saturated a small piece of sponge, bound it on my hand, and went about my exercises, feeling no more particular inconvenience."  
Sold by all Medicine Dealers everywhere. 22v14-3-9p

## NORTH AMERICA

## Life Insurance Company.

## Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The highest price paid for Scrap Iron. 9v143m9p

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF  
**FLAT & ROUND WIRE ROPE,**  
For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach  
SAN FRANCISCO.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery; stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—  
**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—

**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope**—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**— $\frac{1}{4}$  to  $\frac{1}{2}$ -inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Sizes and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Gir. Wt. pr. 100 ft.	Gir. Wt. pr. 100 ft.	Gir. Wt. pr. 100 ft.	Size Link.	Brk'g Wt. pr. 100 ft. Load.
2 53	1 33	5 100	$\frac{3}{8}$	lbs. tons 7 2,800
2 83	2 55	6 130	$\frac{1}{2}$	lbs. tons 11 3,700
3 170	2 91	8 236	$\frac{3}{4}$	lbs. tons 19 6,300

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 23v14-6m9p

**STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,**  
And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coling Machinery, File Drivers, Bark and Mail Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam, Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. Those very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, Oerman Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRISCOTT. IRVING M. SCOTT.

H. J. BOOTH & CO.

Stills, Wrought Iron Worms, etc., etc.

Manufactured to Order.

**Old Boilers Repaired**  
**D. CAMERON.**

5v12-ly

A NOVEL CLOCK may be seen at Mr. Randolph's jewelry store on Commercial street, Nevada City. Instead of "striking" the hours of the day, when the proper time arrives, a door opens, a little automaton bird slips gaily out and "cuckoos" the required number of times. The editor of the *Gazette* of that city, thinks it comes the nearest to a "live clock" of anything he has ever seen.

**TABLE ROCK DOOMED.**—It said that in consequence of the constant giving away of Table Rock, at Niagara Falls, and the danger of accidents therefrom, the town council of Clifton, Canada, within whose jurisdiction it is located, have determined to blow it away with "villanous saltpeter."

**THE DRAW BRIDGE** across the Willamette is currently talked about at Portland, Oregon. A party in this city has offered to construct the same for \$149,042. The plan is the same as that across the Sacramento in this State. It is stated by the *Oregonian* that active steps will soon be taken for the construction.

**GOLD MINING IN CANADA.**—It is said that there are seventy-three gold mines in Canada, employing 708 miners. The London Mining Journal says that during the last quarter of 1865 the yield of gold was \$690,000.

**National Mineral Land Law, Instructions.**  
Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address Dewey & Co., office Mining and Scientific Press, San Francisco.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better

Than other offices

**Bitters.**  
THE WORLD RENOWNED REPUTATION, TOGETHER with the extensive and increasing demand for Dr. Hufeland's Swiss Stomach Bitters, will at once recommend them to the favorable notice of all connoisseurs and lovers of a good and healthful tonic and invigorator. As a purifier of the blood, acting surely, yet gently, on the secretions of liver and kidneys, they are unsurpassed and a most agreeable drink.

For sale at all wholesale and retail stores on the Pacific Coast, and at the depot of TAYLOR & BERDELL, 413 and 415 Clay street, between Sansome and Battery, San Francisco. 21v14-6m

## A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.

## Golden City Chemical Works.

**LABORATORY,**

**BLAKE'S PATENT**  
**QUARTZ CRUSHER.**

**CAUTION!**  
The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

**This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.**

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. **BLAKE & TYLER,**  
1v14tf Agents for the Pacific Coast.

**Important to Secretaries.**

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the law regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at \$1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the Mining and Scientific Press on application at the office.

**DEWEY & CO., Publishers.**  
505 Clay street, corner Sansome, San Francisco.

**Illegal Supplemental Advertising.**—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

## Professional Cards.

**SHERMAN DAY,**  
Mining Engineer,  
No. 114 Montgomery Block, San Francisco.  
Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines.  
22q

**CHAS. LIEBENAU,**  
Mining Engineer and Metallurgist,  
(Graduate of the Mining Academy, Freiberg, Germany.)  
Oro, Flint District, Owyhee Co., Idaho.

Office, 617 Clay street.....San Francisco.  
First-class gold fillings for \$3, as good as any dentist can  
produce in the city. Dr. Winter has practiced Dentistry  
twenty years—fifteen in this State. For a full upper set of  
gum teeth, on vulcanite base, from \$30 to \$35. Teeth ex-  
tracted without pain by local application. 15v14-1f

## Overland Route.

**THE PENINSULAR AND ORIENTAL**  
STEAM NAVIGATION COMPANY'S

**STEAMSHIPS**  
Leave Hongkong Twice a Month,  
On the 1st and 15th in the Northeast Monsoon,  
and about the 11th and 29th in the  
Southwest Monsoon.)

**SOUTHAMPTON AND MARSEILLES,**  
**VIA EGYPT,**  
Calling at Singapore, Penang,  
Point de Galle, Aden, Suez, Alex-  
andria, Malta and Gibraltar.  
From Point de Galle their steamers run to Madras,  
Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.  
From Hongkong their steamers run constantly to  
Swatow, Amoy, Poochow, Shanghai, and Yokohama.  
Hongkong, 1867. 13v14tf

**Important to Californians.**—Many inventors have  
lately had their claims for Patents seriously (and in some  
cases fatally) delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. The MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the regulations of the Department, and properly  
filled all necessary papers as Claim Agents.

## Metallurgy.

**BOALT & STETEFELDT,**  
Metallurgists and Mining Engineers  
**AUSTIN, NEVADA.**  
Western Branch of ADELBERG & RAYMOND, No. 90  
Broadway, New York. 11v11

**G. W. MAYNARD. J. H. TIEMANN.**  
**MAYNARD & TIEMANN,**  
Mining Engineers and Metallurgists,  
240 Pearl street, New York,  
—AND—  
**CENTRAL CITY, COLORADO.**  
15v12-1y

**EUROPEAN**  
**METALLURGICAL WORKS,**  
—AND—  
**Practical Mining School,**  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphurets, pyrites, and the so-called "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. F. KIMBALL, J. R. MURPHY.  
10v10

**MOSHEIMER'S**  
**Metallurgic Works**  
And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.  
Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.  
Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

**CONSULTATION OFFICE:**  
328 Montgomery street, San Francisco.  
**J. MOSHEIMER,**  
26v13-3m Engineer and Metallurgist.

**J. A. BAUER,**  
**Chemical Laboratory,**  
AND DRUG STORE, (Established 1842.)  
644 Washington Street. SAN FRANCISCO.

Careful Analyses made of  
**Ores, Minerals, Waters, Oils, Liquors,**  
**Wines, Products of Art, etc.**

**Pharmaceutical Preparations Made to Order.**

Opinions given on Chemical Questions and Geology.  
Particular attention paid to Analyses of all kinds, in  
cases where legal questions are involved.  
Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin  
Chloride, Sodium Amalgam, Sulphate of Copper, etc., for  
sale. 12v14-6m

**Mineral Land Law Blanks**  
**FOR SALE.**

We are prepared to furnish any of the following  
blanks used in securing patents for lands under the  
National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.  
II. Diagram, Description of Diagram and Bound-  
aries, and Notice.  
III. Register's Order for Publication—with No-  
tice.

IV. Deposition that Notice has been Posted.

V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen;  
\$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions  
of the General Land Commissioner, post  
paid, 25 cts. Address **DEWEY & CO.,**  
Mining and Scientific Press, San Francisco.

**Our Patent Agency.**

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS  
has been signalized with remarkable success during the  
past two years. The importance to the inventive genius of  
this coast of a thorough and reliable agency for the solicitation  
of LETTERS PATENT from the United States and foreign  
Governments cannot be over-rated, and the Proprietors of the  
Press, feeling the responsibility which rests upon them, and  
the reward which must follow the faithful performance of  
their trusts, will take care to afford inventors every advantage  
to be secured to them through a competent and re-  
sponsible agency upon this coast.

**Postage.**—The postage on the MINING AND SCIENTIFIC  
PRESS to any portion of the United States is twenty cents per  
annum, or five cents per quarter, payable in advance at the  
Post Office delivering the paper. Postage free in the city  
and county. Foreign postage (with few exceptions) two  
cents per copy, prepaid. To Bremen and the German  
States (marked via Bremen and Hamburg line), three cent  
per copy, prepaid. Single copies to any address in the United  
States, two cents.

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

## New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.  
San Francisco, May 1st, 1866.

## New Mining Advertisements.

## Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of June, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 5 Government House, corner of Sansone and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 5 Government House, corner of Washington and Sansone streets. J. M. BUFFINGTON, Secretary.

## To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS County, with access to all the best markets, and with more than \$50,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to BELLOC FRERES, Bankers, 535 Clay street, San Francisco.

## Mining Notices—Continued.

## Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-ninth day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the 429 Pacific street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 429 Pacific street, San Francisco, Cal. J. C. TAYLOR, Secretary.

## Cineo Schorea Gold and Silver Mining Company.

Copala, Sinaloa, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of May, 1867, an assessment of ten (10) cents per share was levied upon each and every share of the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, No. 525 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-second day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.  
Office, No. 525 Clay street, San Francisco, Cal. my4

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment, is hereby postponed until Saturday, the 28th day of June, 1867, and the sale thereof until Saturday, the 30th day of July, 1867. By order of the Board of Trustees.

EDWARD C. LOVELL, Secretary.

## Chilpaneca Mining Company—District of Ores, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of May, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.  
Office, 318 California street, San Francisco, Cal. jel

## Cordillera Gold and Silver Mining Company, Chihuahua, Morcles Mining District, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of April, 1867, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 321 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.  
Office, 321 Washington street, San Francisco, Cal. my25

## Camargo Gold and Silver Mining Company, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of February, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Camp, Jas.	74	5	\$100.00
Drinkhouse, J. A.	6	5	60.00
Dinkelspiel, J.	51	10	60.00
Harker, W. B. C.	24	10	20.00
Harker, J. W.	134	3	60.00
Jacobs, N. B.	85	1	20.00
Fassett, N. C.	132	1	20.00
Gray, Asaph.	133	3	60.00
Lander, B. C.	69	6	120.00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, Auctioneers, on the 21st day of May, 1867, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.  
Office, 402 Front street, San Francisco. mar30

POSTPONEMENT.—The above sale is hereby postponed until Friday, the 21st day of June, 1867, at the same hour and place. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

## De Soto Gold and Silver Mining Company—Location of Works: Star District, Humboldt County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twentieth day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. shares.	Amount.
Belldeman, J. C.	157	10	\$9.00
Belldeman, J. C.	430	8	8.00

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of April, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, at Nos. 418 and 420 Clay street, San Francisco, California, on Monday, the seventeenth day of June, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. B. STEVENS, Secretary.  
Office, 418 and 420 Clay street, San Francisco. jel

## Lady Franklin Gold and Silver Mining Company—Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1867, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the second day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JO. S. LUTY, Secretary.  
Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. my4

## Mount Davidson Gold and Silver Mining Company, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office of the Company.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. PARDOU, Secretary.  
Office, 121 Sutter street, San Francisco, Cal. my25

## Nuestra Señora de Guadalupe Silver Mining Company, Tayoltita, San Dimas District, Durango, Mexico.

The public is herewith cautioned against buying or negotiating the following described Certificates of Stock in said Company, to wit: Issued to H. Bruenings, No. 96, 5 shares; to Wm. Gelmann, Nos. 105, 107 and 108, each 10 shares; and Nos. 55, 109, 110, 111, 112, 113, each 5 shares; to Chas. Schumacher, No. 47, 5 shares; and No. 61, 15 shares; and to La Abra Silver Mining Company (New York) No. 156, 550 shares, as said Stock has been sold for delinquent assessment (No. 25) at public auction, on Wednesday, May 15th, 1867.

F. J. PEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco. my18

## Nuestra Señora de Guadalupe Silver Mining Company. Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of May, 1867, an assessment (No. 27) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PEIFFER, at his office, No. 210 Post street, or to the Treasurer, A. H. WILKINSON, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the tenth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. J. PEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco, Cal. my25

## Neagle &amp; Corcoran Gold and Silver Mining Company, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of May, 1867, an assessment of twenty-five (25c) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room No. 11, 333 Montgomery street, in the City and County of San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM CORCORAN, President.  
A. P. ORRICK, Secretary. my18

Notice.—A meeting of the stockholders of the NEWTON COPPER MINING COMPANY, will be held at the office of the Company, at the mine, in the County of Amador, on TUESDAY, the eleventh day of June, A. D. 1867, at 3 o'clock P. M. By order of the Board of Trustees.

JABEZ NEWTON, Secretary.

April 30th, 1867. my14w

## Office of the Providence Mining Company—Notice.—The Annual Meeting of the stockholders of the above Company, for the purpose electing Trustees, and transacting other necessary business, will be held at the office of the Company, No. 5 Government House, San Francisco, on the TWENTY-THIRD DAY OF JUNE, 1867, at 2 o'clock P. M., of that day.

F. T. FOLSOM, President.

J. M. BUFFINGTON, Secretary.  
San Francisco, May 27, 1867. jeltd

## Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.  
Office, 318 California street, up-stairs, San Francisco. m26

## Seaton Mining Company—Location of Works: Drytown, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of May, 1867, an assessment of one hundred dollars per share was levied upon the capital stock of said Company, payable July 6th, 1867, in United States gold coin, to the Secretary, at his office, No. 60 Exchange Building, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.  
Office, No. 60 Exchange Building, San Francisco. jel

## St. Louis Silver Mining Company, Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth (4th) day of May, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 331 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. my11

## Union Copper Mining Company, No. 2—Ledge or Claim situated in Copper Canon District, County of Calaveras, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Harrier, J. W.	244	20	300 00

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. It is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years' experience in mechanical operations, and may be addressed at San Francisco, or called on at the Millers' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

VARNEY'S  
PATENT AMALGAMATOR.  
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

## This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Solders made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**  
141 San Francisco.

## FOR SALE!

PATENT RIGHT OF  
HUNT'S WINDMILL for the  
State of California or the whole  
Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right. This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

**E. O. HUNT,**  
28 SECOND STREET,  
11v24 San Francisco.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the **HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v143m

JAMES HITCHENS.

The Patent Rattan, Street, Stable, Fine and Plume Brushes, for which they have the exclusive right for the Pacific Coast.

All orders from the Interior promptly executed. **FELDMAN, SIMPSON & CO.,** Proprietors. 10v143r

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.** The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, ore advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.** The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

**RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1856.**

**JAMES BRODIE, Esq., San Francisco.** Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, **R. P. JOHNSON,** Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALCAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1854. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1856, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A drawing and full description of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1856.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1856.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street, San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber lining, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at G.

The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, are for sale by

**V. CUSHING,**  
130 Front street, San Francisco.

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

See illustration and description of this Pump, published every other week in this paper. 10v143r

LEFFEL'S  
American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALLED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,  
—AND—  
PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

## SPIRITS OF TURPENTINE &amp; ALCOHOL.

NOTE.—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

## Lamps and Lamp Stock!

An elegant and complete assortment on hand. 3v13-3m19 414 Front street, San Francisco.

## GOVERNMENT HOUSE,

Corner of Sansome and Washington sts.

SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes.

The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half the rates required to pay at hotels.

**SANBORN & CO**

**REESE RIVER ITEMS.**—The following items were this week crowded out from their regular place under the head of "Mining Summary":

From the *Reveille*, May 31st: B. Evans and T. J. Tennant, have located a fine ledge in Reveille Dist. They have taken out two tons, and intend to ship five tons to this city. The ledge is four feet thick a few feet below the surface, and is a compact body of uniform mineral.

An assay of the pulp of 5,493 pounds of ore from the Fisherman ledge, crushed at the Parrott mill, yielded \$382.93.

Julian & Clark, of the Bullion Co., are exhibiting thirty or forty specimens of ore, taken from various depths in their Fisherman ledge. Some of the richest pieces, showing plenty of horn silver, were so covered with lime debris as to resemble burnt bone. The ore presents great and marked variety, and appears to be a collection from a number of ledges, instead of one only.

The Fortuna ledge on Lander Hill, at a depth of 250 ft. has a width of from four to six in., containing a mass of highly concentrated ore, in which solid pieces of ruby are conspicuous. Several tons have been sent to the Empire mill for reduction.

From 27½ tons of ore from the Buel North Star, worked at the Keystone mill, bullion to the value of \$8,888.93 was produced.

The owners of the Consolidated Co. have been experimenting with wet crushing, but experience has taught them that the ores of this district cannot be successfully treated without roasting.

A coal vein is said to have been discovered somewhere down Reese River; samples have been exhibited, which have every appearance of good anthracite.

Silver Bend Reporter, June 1st: Grading at the Combination Co's works is progressing rapidly. The pipes for conducting the water from the spring to the reservoir are all on the ground. As soon as the pipes are all laid, mason work will be commenced on the foundation; 50 perch of stone are delivered daily; 500,000 brick will be required for the upper walls; 300,000 feet of lumber will be used in the construction of the mill.

May 30th: Four tons of ore from the Kalesed mine of Plymouth Co. reduced at the Parrott mill at Big Creek, and assayed by Boalt & Stetefeldt, yielded as follows: One-half ton first class ore yielded at the rate of \$2,108.36 per ton; 3¼ tons of second class ore yielded at the rate of \$280.53 per ton. The company is now sinking a vertical shaft, for the permanent development of the mine.

Upwards of 7,000 ozs. of crude bullion were brought into town from the Rigby mill, San Antonio Dist., from ore obtained from the Liberty mine, one of the oldest in the district, which has developed lately a better class of ore than ever before.

Trespass, May 28th: Mining has been resumed on the Sacramento claim, on Cedar Hill.

From the *Register*, June 1st: The Washington Mill and Mining Co. has resumed work on its mine in Echo District, under the superintendence of W. S. Sargent.

Midian Torrey has not yet started his mill, but will in a few days. Some castings which he ordered from San Francisco being detained on account of the snow, Mr. T. cut out his patterns and had his castings made in Virginia City. Mr. Torrey will be able to load all the teams for Humboldt and Idaho with back freight during the summer.

A much richer stratum of ore has been struck in the Liberty mine, San Antonio, than that heretofore mined. The Rigby mill has been constantly running upon ore from the Liberty for a number of weeks; the pulp assays have ranged at near \$300 per ton.

One ton and a half of ore from Reveille Dist. was last week worked at the Parrott mill at Big Creek, the pulp assay of which was \$891.

**A LECTURE ON FLYING.**—At a late meeting of the Royal Institution in London, Dr. Pettigrew delivered a lecture on the principles of support and progression in the air, as exemplified in the wings of birds and insects. He pointed out the importance of the screw movement, both as an instrument of support and progress. A certain amount of weight in the flying object was shown to be necessary to its hold on the air. Dr. Pettigrew has evidently great faith in the ultimate success of the attempt to devise an apparatus which shall not only maintain itself in the air, but move in a required direction.

A Lump of solid Montana silver, weighing seventy-three pounds, is on exhibition in St. Louis.

**THE INDUSTRIAL AND IMMIGRATION SOCIETY.**—The above Society met on Wednesday evening at the auction room of Messrs. Maurice Dore & Co. Gen. H. A. Cobb was elected President for the ensuing year. Thomas Mooney was elected Vice President and J. W. McKenzie, Secretary. The subscriptions to the stock were then commenced, and upwards of a thousand shares were taken. A resolution was adopted requesting Dr. Huddart to deliver a free lecture, at Platt's Hall, on the best method of promoting European immigration. A report of a plan of operations was presented by Dr. Pigné Dupuytren for future guidance of the Board. Dr. Dupuytren announced F. L. A. Pioche as taking 500 shares of stock and twenty-five additional shares monthly. Letters of co-operation were read by Gen. Cobb, from Cornelius De Boom, Esq., now a resident of Paris, offering hearty co-operation; also a letter to the same import from R. Hall, Esq., of Liverpool, a gentleman well known in this city, reporting a growing interest in the minds of immigrants in England in reference to the prospects that California offers to them. The business and prospects of this Society seem to swell to National dimensions, and there is a well founded hope now very generally entertained, that out of all the projects to aid immigration which have latterly been proposed, that a large accession to our population is morally certain in the immediate future.

**THE ELEVATION OF MINES.**—The silver mines of Kearsage are ten thousand feet above the level of the sea. The silvermines of Alpine county are from five to six thousand feet above the sea. The New Almaden quicksilver mines are one thousand feet above the sea. The mines on the Comstock are from five to six thousand feet above the sea. Reese river and Esmeralda mines are about seven thousand feet above the sea. The Idaho mines vary from three thousand to six thousand feet above the sea. The mines of Arizona are at various elevations, from three hundred to three thousand feet above the sea. Those on the banks of the Colorado are perhaps as near the level of the sea as any known. The following number of miners are given for California: Total number of white miners, 25,750; total number of Chinese, 20,300. Placer miners, 20,550; hydraulic miners, 5,850; silver miners, 13,000; copper miners, 2,700. So says J. Ross Browne.

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. ## Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

On Hand and for Sale.

#### THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

#### Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained until the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back, but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-3m

#### Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Ours and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McFARLANE & CO., Druggists and Chemists, 434 Sacramento street, opposite What Cheer House, San Francisco. 10v14-ly

#### HOADLEY'S.

#### FOUR SIZES,

8, 10, 12, and 15-Horse Power,

#### HOADLEY'S.

3 to 40-Horse Power.

#### HITTINGER'S.

#### THREE SIZES,

5, 7, and 10-Horse Power

#### HITTINGER'S.

#### TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., Corner of Front and Market streets. 9v14-6m1p

## List of Officers of Corporations and Mining Companies.

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

**CROWN POINT G. & S. M. Co.**—June 3d. Trustees: Thos. Sunderland, Thos. Bell, Wm. B. Johnston and A. Hayward. President, Thos. Sunderland; Secretary, Chas. E. Elliot; Treasurer, Thos. Bell; Superintendent, C. C. Batterman. Office, No. 708 Montgomery street.

**ENTERPRISE G. & S. M. Co.**—June 5th. Trustees: A. DeLand, E. B. Mott, Jr., Gen. John F. Miller, Hiram Pomeroy and Wm. B. May. President, A. DeLand; Secretary, Wm. B. May; Treasurer, E. B. Mott, Jr. Office, No. 5 Government Building.

**LYON M. & M. Co.**—June 6th.—Trustees: A. C. Teitman, W. H. Lyon, J. S. Kennedy, A. Walrath and W. N. Wade. President, A. C. Teitman; Secretary, J. M. Buffington; Treasurer, W. H. Lyon; Superintendent, J. S. Kennedy. Office, 5 Government Building.

**YOSEMITE CONS. M. Co.**—June 3d.—Trustees: R. L. Bampton, Peter Brandow, John Connor, Wm. K. Squires and Robt. Stuart. President, Richard L. Bampton; Secretary, David Wilder; Superintendent, Peter Brandow. Office, No. 529 Clay street.

**FRED ROHRER**, is the name of the inventor of the device described in our last issue, for preventing lamp explosions. In addition to securing his invention in this country, he has already applied for a patent for France, and will probably do so for several other European countries.

## Cholera—Perry Davis' Vegetable Pain Killer.

MR. PERRY DAVIS—Sirs—The benefits I have received from the use of your invaluable remedy, the Pain Killer, induces me to pen a word in its praise. Experience has convinced me that for Headache, Indigestion, Pain in the Stomach, or any part of the system, severe Chills, Weariness, common Colds, Hoarseness, Cholera, Cholera Morbus, Diarrhea, Dysentery, Toothache, etc., there is nothing better than the Pain Killer. I have this hour recovered from a severe attack of the Sick Headache, by using two teaspoonfuls, taken at thirty minutes interval, in a wine glass full of hot water. I am confident that through the blessing of God, it saved me from the cholera during the summer of 1865. Traveling amid dust, toil, change of diet, and constant exposure to an infected atmosphere, my system was daily predisposed to dysentery attacks, accompanied with pain, for which the Pain Killer was a sovereign remedy. One teaspoonful curing the worst case in an hour, or, at most, half a day! I have heard of many cases of Dysentery being cured by its use. Put in the teeth, it will stop the toothache. Gratitude, and a desire for its general use, has drawn from me this unsolicited testimonial in its favor.

D. F. TAYLOR, Jr., Minister of the Gospel.  
Sold by all Medicine Dealers everywhere. 22v14-1m

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

## FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

## Directions for Operating Hendy's Concentrators:

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—Set the Pan, A, level, by its inner rim.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

## References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:  
EMPIRE MILL.....Grass Valley, Nevada County.  
CONEY & BIGELOW MILL.....Jackson, Amador County.  
SPRING HILL MILL.....Amador, Amador County.  
GOLDEN GATE MILL.....Volcano, Amador County.  
OPHIR MILL.....Placer County.  
C. H. SCHNABE'S MILL.....Doty Flat, Placer County.  
GOLDEN RULE MILL.....Stewart Flat, Placer County.  
BENTON MILL.....Bear Valley, Mariposa County.  
LOUISIANA MILL.....Coulterville, Mariposa County.  
PEOPLE'S MILL.....Alleghany, Sierra County.  
TYRON & CO'S MILL.....Prescott, Arizona.  
WOOLSEY & CO'S MILL.....Prescott, Arizona.  
NOYES & CO'S MILL.....Prescott, Arizona.  
GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.

RECENTLY ORDERED FROM THE UNION IRON WORKS:

VEATCH, VALENTINE & CO., Commercial Mill (4 Concentrators).....Nevada County.  
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.  
VULTURE CO. (4 Concentrators).....Prescott, Arizona.  
MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.  
PLYMOUTH ROCK MILL CO. (2 Concentrators).....Grass Valley.  
B. F. BROWN (1 Concentrator).....Melbourne, Australia.  
MOONY & SPERRY (1 Concentrator).....New York.

And in use in many other parts of this coast.

These Machines are made of iron, thoroughly constructed and ready for immediate use. For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

## Remarks:

Many Concentrators have been gotten up in this city. Some of these claim foreign origin; others are of home production. The sonorous Greek names, with which some of these have been dignified, ought, it would seem, to have entitled them to a better fate than that which has befallen them. A large proportion of these machines are now "numbered among the things that were." A few were still-born; never having had an existence except in the shape of advertisements and cuts, prematurely prepared by their too confident projectors. For one of these it was claimed, with a grand flourish of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order or in the way." Unfortunately, however, although it had a reasonable supply of legs, it obstinately refused to run. Amputation failed to remedy the defect, and it now lies forgotten among a heap of old iron,—a mechanical abortion. J. H.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works, for 1866, pages 51, 53.

## CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,

## Foundry for Sale.

A One-half Interest in the  
UNION IRON WORKS,  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 55 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
26v13tr9-1cp Sacramento, Cal.

Pacific Mail Steamship Co's  
STEAMSHIPS FOR  
NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. at the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. Co.'s steamer for Central America.

The following Steamships will be dispatched on dates as given below:

June 10th—CONSTITUTION.....Capt. W. F. Lapidge, Connecting with the RISING STAR, Capt. Gray.

June 18th—GOLDEN CITY.....Capt. Jas. T. Watkins, Connecting with ARIZONA, Capt. Harris.

June 29th—MONTANA.....Capt. Jos. Sutton, Connecting with OCEAN QUEEN, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

THE COLORADO will be dispatched July 4, at noon, and will be followed by the GREAT REPUBLIC, on August 24th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

## Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator.

With this number of our paper we are enabled to present to our readers, as well worthy the careful examination of all practical miners and millmen, an illustration of Hinkle & Capp's new Centrifugal Ore Grinder and Amalgamator—a California invention of much promise. The patent is dated April 16th, 1867. While the principle made use of is quite novel in pans for grinding ores, its adaptation is considered strictly in accordance with acknowledged rules of mechanics, and the tests made seem to establish its successful application. In simplicity of construction, strength and durability of the parts, and general compactness, this machine shows superior excellence.

The following is a good description of the pan and its particular merits, given by the patentees:

In these pans the dead weight and drag of the usual upper plates bearing upon the surface of the cone or floor of the pan is entirely avoided, while a greater amount of actual work is accomplished with much less wear of iron by means of the centrifugal force generated by the revolution of the muller-arms or driver. The grinding is effected solely upon the perpendicular iron plates, G, which line the sides of the pan, by perpendicular mullers or shoes, F, thrown laterally against them when the arms are revolved. The hangers, E, which carry the muller plates, F, are hinged loosely, and play freely on pins near the ends of the driving arms, and also supported by having each a projecting lip, I, which rests on a bearing surface, D, on the arm which follows it. The muller plates are thus kept always parallel to the side plates or dies, G. The shape of the muller-hangers, E, is calculated so as to correspond with the curve of the grinding surface of the sides of the pan, and thus causes the muller plate or shoe, F, to wear in a parallel curve, and with less waste of iron than in any other form of grinding surface. The muller-plates or shoes and the side dies are therefore worn from top to bottom in a perfectly straight line, which remains true till they are worn out. As they are thinned by wear, weighting blocks are added at the back of the muller-hangers, one of which is shown at the foot of the pan. A top view of a part of the pan, showing the side dies, arms and muller-hangers and plates, supporting lips and bearing surfaces, is also given. The cover used in grinding and discharging continuously is also shown separately—that exhibited in the principal view being the one adapted for grinding

separate charges. It is an important result of this arrangement that the wear upon every portion of the grinding surfaces is uniform, the work being all done upon the circumference of a single circle, i.e. the sides of the pan. In every pan grinding upon the bottom of the pan or cone, the friction and wear of the iron is necessarily greatest at the outer edges of the plates where the circumference and motion is greatest. The surfaces are thus soon worn apart, so that the work done is lessened, and the friction towards the center, where the least can be accomplished, is greatly increased. This serious defect, to overcome which so many devices have been used in other pans, does not exist in this.

When the arms are revolved the muller-bangers and the muller-plates they carry are thrown out laterally and pressed against the side dies of the pan, the extent of pressure depending upon the speed attained, and the pulp is ground between the two. The peculiar shape of the muller plates causes the pulp to enter easily between them and the side dies, and the pressure there to be lightest and to increase towards the heel of the muller. Each muller being hung thus loosely, is able to yield and permit to pass by it any coarse pieces of quartz or ore, or obstructions, such as pick points or iron, etc., that may accidentally drop in. None of the other mullers, each being independent, is affected in such a case, but all are at liberty to perform their full share of work.

HINKLE & CAPP'S PATENT CENTRIFUGAL GRINDER AND AMALGAMATOR.

Practical mill men, accustomed to the use of grinding pans in which all the upper plates are fastened to one solid muller or driver, are aware of the trouble and delay and frequent strain or breakage caused by such obstructions. In this pan such an obstruction could readily pass by one muller after the other without interfering with the rest, and without danger of being jammed or doing injury; or falling upon the bottom of the pan, which is flat, could remain there, the arms leaving a clear space of an inch below them, while below the mullers, against the sides of the pan, in the mercury groove, the space is greater.

This pan is adapted either for working single batches or charges of silver ores or gold-bearing rock, or for grinding and discharging continuously the crushed rock as supplied directly from a battery—different shaped covers being used in the two cases. For grinding separate charges of ore the walls of the pan are made higher and flaring, as shown in the principal engraving, and the top either left open or supplied with a light wooden cover, or a cast iron cover, if desired, as drawn above. The form of this cover directs the current of the pulp into the center funnel, so that it again passes under the driver, across the bottom and between the mullers and side dies, until the grinding is completed. Around the circumference of the inner bottom of the pan, immediately below the mullers, is a deep groove for the reception of the mercury. This is divided into sections by cross partitions, so that little or no current of the mercury is created. Thus the mercury is not ground and cut up with the rock, which however passes over it and is acted upon by it, while the gold or silver in settling is caught and held by it. The top of the iron cover is provided with a groove, in which mercury is placed, over which the pulp passes on its return to the center.

While the proprietors of this patent are of the opinion that experience has shown that it is better not to seek to amalgamate in any pan in which

ore is ground, but to do so by slow, simple rubbing and stirring of the pulp in contact with mercury after the grinding is completed, yet, as it is often customary to amalgamate in such pans, they have made, as shown, ample provision for doing so in this when desired. In their pan, however, while the mercury is effectually brought into contact with all the pulp, it is yet completely protected so as not to be cut up and dissipated by being carried off in small particles. No trace of mercury has thus far been detected in the pulp in any of the trials made.

For grinding and discharging continuously, a simple convex iron cover is used, of the shape shown in the small figure, the pulp, as fast as ground, being discharged from the center and flowing off over the surface of the cover into a conducting trough which carries it away into the settlers or waste flume. The same provision is made for the use of mercury in this pan. It can readily be drawn off by plug-holes connecting with the lower groove.

These pans are being built at the Miners' Foundry, in this city. They are intended to work charges of 800 pounds each. Six mullers, weighing forty-four pounds each, are employed in each pan. They are intended to be run at a speed of from sixty to eighty revolutions per minute, according to the hardness of the ore or rock. The weight of each is about 3000 lbs., including an extra set of six mullers. The weight of the pan, as

arranged for grinding and discharging continually, is about 2700 lbs., which also includes an extra set of mullers. The price of either is \$500, with the extra set of mullers, completely fitted and ready to be set up and used.

The work done by this machine is accomplished thoroughly, rapidly, and with extreme regularity and evenness, whether the supply of pulverized rock fed to it is great or small. Scarcely any difference in the fineness of the pulp discharged is perceptible, and no coarse particles are to be found among it.

It will thoroughly grind (and amalgamate) a single batch or charge of 800 pounds of ore in from one-fourth to one-half less time than is required in the best of other pans. If arranged for continually discharging, it will receive without clogging all the crushed rock supplied directly by a battery of five stamps, with Nos. 4 or 5 screens, and thoroughly grind it to the same or a greater degree of fineness as now accomplished in the best pans hitherto made for the same purpose, and discharge it continually as fast as supplied, ready for any subsequent process of chlorination, amalgamation, or separation. When thus used, provision must be made for carrying off the slum and water, so that only a sufficient quantity enters the pan.

While in operation it moves smoothly and evenly, without strain upon any of the parts, and requires no attention except occasional oiling, as there is no regulation such as raising or lowering of the driver or mullers, required as in other pans; and if necessary, the mullers can be lifted out separately by hand as soon as the cover, if used, is lifted. It can therefore also be cleaned up by one man without any necessity for lifting the driving arms, which, when not in use, are easily turned by hand, there then being no friction. It also starts easily, there being no friction until the revolutions become speedy, when the mullers are thrown against the side dies. All these, as will be seen, are decided

advantages in its favor over those possessed by other pans.

It is claimed for this pan that it is neater, lighter, simpler in its construction, and therefore less liable to be broken or disordered, and consequently cheaper, than any other grinding pan yet used. Also, that it will do more work, and do it more thoroughly and in less time, with the same power required for any other pan used and claimed to be of the same capacity.

These pans, as originally made, were also supplied with upper mullers secured to the arms, to grind, in the usual manner, upon bottom plates. But it was found that these were wholly unnecessary, as the side mullers do more work, more rapidly, and of better quality, with vastly less power alone, when omitting the grinding on the bottom altogether. As now made, the arms and the mullers play entirely clear of the bottom, leaving an open free passage for the pulp from the center to the sides, and the whole work is done by the centrifugal force of the mullers against the sides. It will, therefore, work coarser rock than can be used in many other pans, and is thus adapted to use in cement claims and for prospecting where facilities for thorough crushing do not exist. For this purpose, a smaller and cheaper pan will shortly be manufactured.

In addition to the above statement, the proprietors say they desire nothing more than that their pans shall be fairly tested, and, where possible, in competition with other pans claiming similar or greater capacity, as their merits will thus be demonstrated and become known. They are willing to sell them on condition that they shall be fairly tried and prove to be capable of doing all that is claimed for them, or returned. Our own examination of them when in operation has satisfied us that they are a highly useful and meritorious invention, and likely to be largely adopted by practical mill men. Practical mechanics who have seen them are pleased with their plan of construction and work.

One of these pans is now at work at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, in this city, where it may be inspected at any time and seen in operation by all interested. We advise all interested in mining and milling operations to examine it, and persons erecting new mills, or about to purchase such machinery, will find it to their interest to see this invention.

Any further information, for the present, may be obtained of the proprietors, Messrs. Philip Hinkle and Charles S. Capp, No. 543 Clay street, San Francisco, to whom letters may be addressed, or of S. P. Kimball, Esq., at the European Metallurgical Works above mentioned, where the pan may be seen in operation, or at the Miners' Foundry, First, near Folsom street.

THE OAKLAND COLLEGE SCHOOL EXHIBITIONS, held on the evenings of the 12th and 13th insts., in the College School hall, were in every way creditable to that institution. Great proficiency was shown in recitations in German, French and Spanish, and considerable musical ability displayed in performances upon the piano, and by the brass band. When called upon to do so, the students can represent in language, and with perfect accent, nine different nationalities. Without going further into detail, it is sufficient to say that the most perfect satisfaction was given in the closing exercises of this school, and we have no hesitation in recommending it to the attention of the citizens of the Pacific coast generally.

## Communications.

In this DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 359.]

## IN PARK CANON

Is situated a lode which bids fair to rival the Murphy. This district was discovered in 1865, subsequent to the occupation of Ophir Cañon by the Murphy party. A fine mill is in progress of construction here. Unlike the Murphy mill, it stands below the mine, at the mouth of the cañon, thus obviating the expense of hauling the material for its construction, and its future supply of fuel, up the steep grade, while it will not be difficult to run the ore down. The next place claiming our attention is Kingston, in

## BUNKER HILL DISTRICT,

Which is located eighteen miles north of Park Cañon and twenty-five miles directly south of Austin. Two mills were erected here in 1865-6, one originally designed to be run by water power, of which there is an abundance in the cañon. Here again we find a district cursed by the prevalent folly of the years above named; that is, the building of mills in advance of the opening of the mines. Wherever this has occurred, miners have become discouraged and invariably neglected their mines for the following reasons: Capitalists always shun mining districts where idle mills stand; again, if the mills have not been closed by the sheriff, they are kept so by the owners, for it does not pay to start up for a week or so on occasional small lots of ore, to again lie idle for months; lastly, and the principal reason is, that such a thing as concert of action between mill and mine owners never existed within my experience, and probably never will. These interests, which should be identical, are too often antagonistic. Without discussing the causes for such a state of feeling (which are evident enough to old miners), the odium generally rests on the millmen.

Slate is the predominating country rock of this section, and the ores abound in black oxide of copper, but are invariably rich in silver. Fifteen miles further north brings us to the little deserted town of Geneva, in

## SMOKY VALLEY DISTRICT.

This was one of the early located districts of Reese River, which is now, to all appearances, neglected, and a fit parallel to its neighbor, Big Creek, on the opposite side of the range. Nowhere on our trip have we found so dismal and dreary a camp as this little hamlet of Geneva, with its houses already crumbling to ruin. On a visit to this place, in October last, I noticed a single individual at work near the mouth of a tunnel on the south side of the cañon. That was the only evidence of life seen in all the district. Whatever may have been his prospects and success, I cannot say; but he certainly deserved a full share of the latter. Geneva is rather a pleasant situation, at the mouth of Birch Creek Cañon. Birch creek is one of the largest streams that flows from the Toiyabe, affording, at this point, abundant water-power for mills. Its borders are everywhere fringed with willow and birch of small growth. Higher up towards the summit the cañon widens out into meadows of considerable extent, some of which have been enclosed for hay ranches, while the whole region affords excellent range for stock.

Of the mines here, I know nothing. All we can observe from the trail are granite walls, rising abruptly in places to a great height—granite everywhere till we have ascended the cañon four miles; then the formation appears to be basaltic, with an occurrence of frequent quartzose dikes, trending northeasterly.

Since writing the above, I notice an article in a recent number of the Reese River Reveille in relation to this district, which I copy in the absence of any personal knowledge of the mines: "The Commercial Com-

pany is steadily pushing its tunnel into the hillside. It is now about four hundred feet long, and it is calculated that the ledge will be reached in another hundred feet. At present, the Commercial is the only company at work in the district; but the prospects are good for general activity during the coming summer."

Six miles from Geneva we reach the summit of the Toiyabe Range, and are four miles south of Austin. In this vicinity some of the highest peaks are covered with basaltic boulders, similar to those that cover the upper Sierras in California, except that they are probably not water-washed.

Our next visit will be to the range of mountains lying east of Smoky Valley, where, in this and the ranges further east, the recent astonishing developments in the lodes being worked, and the almost daily discovery of others that challenge credulity, is drawing the attention of the whole country.

[To be continued.]

LACOUR'S BITTERS appear to be having a decided "run." Although it is but one month since they made their first appearance "pro bono publico," they have nevertheless found their way into quite universal use in this city and vicinity. They are termed "sarsaparilla," or sarsaparilla-bearing bitters.

The value of sarsaparilla (*smilax* of the botanists) was made known to the medical world three centuries ago; but, through ignorance, its virtues soon became to be disputed, and this important product of the vegetable kingdom was for more than 200 years nearly lost to mankind. The intelligence of the present century, however, has again brought it forward, and in the light of modern science it has now assumed an importance in *materia medica* from which it can never be again deposed. Some idea of the rapid increase of its use within the past twenty-five years may be inferred from the fact that between 1842 and 1849—our latest dates at hand—its export from Central America increased from 5,500 pounds to about 120,000 pounds. Its present export is enormous, while the demand is constantly increasing. It is put before the public, in various forms, as a tonic and blood-purifier. In the shape presented in Lacour's Bitters, it is associated with a number of other medicinal roots and herbs, healthy and beneficial in their tonic effects upon the bowels. The best evidence of the value of these bitters is their great and increasing popularity. Another matter, which Californians should always bear in mind, is the fact that they are *home made*—the bottles, the corks and the hitters are all made in this city, and under the immediate supervision of the gentleman whose name they bear. As an invigorating and strengthening tonic they are pronounced inferior to none—as a home manufacture, they should always be preferred to any imported article.

RAMS vs. GUNS.—Some of the ablest military engineers of the day have expressed the opinion that the most effective naval guns of the future will be steamships used as "rams"—that steam, instead of powder, will be employed as the motive force which is to hurl the tremendous bolts of war engines against the ribs of an enemy. The time will soon come when nothing less than "thunder mountains" (Dunderbergs) will be considered fit for modern Titans to launch at one another in their ocean fights.

A HINT FOR CALIFORNIANS.—In the vineyards upon the Rhine, the grapevines are kept low and as near the soil as possible, so that the heat of the sun may be reflected back from the ground. By this means the ripening is carried on after the sun has disappeared, by radiated heat. Vines trained upon brick walls, with a southern exposure, would be similarly benefited.

A MAN was lately struck by lightning while alone in a field in Indiana. He was entirely divested of his clothing, even to his boots. When found, about an hour afterwards, he was yet alive, but without hope of recovery.

## Facts About Patent Matters.

NUMBER TWO.

## THE OBJECT AND OPERATION OF PATENT LAWS.

The first object of patent laws is to stimulate invention—but that only as a means for accomplishing the still greater and main object of benefiting the public. The power to make such laws, and the object for making them, is clearly set forth in article 1st, section 8, of the constitution, which provides that "Congress shall have power to promote the progress of science and useful arts by securing, for limited times, to authors and inventors the exclusive right to their respective writings and discoveries." Also, "to make all necessary laws for carrying into execution the foregoing powers." The prime object is to benefit the public by stimulating invention, so as to increase, to the fullest possible extent, those inventions or improvements which may be useful or beneficial to any or all classes of the community in the various industrial processes of life. It is thus a most noble object—one well worthy the profound study and attention of all wise legislators—worthy of far more attention that it has yet received in that direction.

## INVENTION IS A NOBLE PURSUIT.

None more so. Its entire object and result is to benefit mankind, by decreasing his labors, increasing his products, multiplying his enjoyments, and giving him more time in which to cultivate his mental faculties, thus enabling him to live a higher and nobler life—in other words, to become more a man and less an animal—hence, to be more a freeman and less a slave to that toil rendered necessary by the wants of his animal life. Its triumphs are not only noble, but preëminently peaceful. Its path is strewn with peace and plenty, instead of war and famine. Instead of ravaged domains, plundered cities, broken and mourning households, the path of its victories is strewn with smiling fields, flourishing and opulent marts, joyous homes, and blessings innumerable. The plowshare, and not the sword, is the emblem of its attendant deity. The noblest hero of history's proudest page never achieved triumphs equal to those of the modern inventor. No act of military hero can compare with his in its grand, noble results, save where, as in our recent war, the sword is drawn to preserve a nation, that it may enjoy, increase and perpetuate the peaceful blessings of invention. In all ages and all countries, inventors or discoverers have ranked among the most valuable citizens of the State. The number and the appreciation of this class of men have greatly increased of late years, and no country has furnished more of them than our own. This is partly owing to the peculiarities which have shaped our individual and national character—partly to the greater freedom of thought and action, coupled with the more general diffusion of education among the masses, and still more to the liberal policy of our patent laws, which not only acts as a stimulant, but places all upon a perfect equality—the poorest and lowliest enjoying the same privileges as the wealthiest.

It has been said that he was a public benefactor who caused two blades of grass to grow where but one grew before. What, then, shall be said of the man who, by his invention, enables one to perform the labor of a hundred, thus increasing a hundred fold the products of his labor? Surely, in the highest sense of the term, he is a benefactor.

## WHY A PATENT IS GRANTED.

As before stated, the object is to benefit the public by stimulating invention. If a person had no assurance that he should have the benefit of his invention—if any one who might choose should be allowed to adopt and use it at pleasure, of course there would be very little inducement for him to spend time or money in perfecting it; or, if perfected, it would be for his interest to hide it from the public as long as possible. But, being assured of the full and exclusive enjoyment of all profit to be derived from the manufacture and sale of it for fourteen (now seventeen) years, he is thereby induced to perfect and bring it before the public as soon as possible; and to do that sometimes requires much skill, labor and money.

But this monopoly to the inventor is granted upon certain conditions: First—that he complies with the requirements of the law, by taking the steps therein specified to secure his right—the most important of which is, that in making his application, he shall give so full and clear a description of his invention that any person skilled in the art to which it pertains shall be enabled to understand and construct it. The object of this requirement is, that when his patent expires, the public may know how to make

and use his invention, and thus have the full benefit of it. Thus the patent is issued to him upon an implied contract; and if he fails to comply on his part, by suppressing any essential fact or feature, or by misrepresenting his invention, so as to make it appear that it possesses functions that it has not, then his patent will be void.

The second condition is, that he shall not have abandoned it to the public before making his application. He may abandon it in several ways—by himself using it in public, especially if accompanied by any statement on his part indicating that he intends to give the public the benefit of it, or by permitting others to use it. This does not, however, prevent him from allowing a friend to use it as a neighborly kindness, or for the purpose of testing its operation. Neither does it prevent him from using it in public, if done solely as an experiment.

If a party completes an invention, and neglects, for two years or more, to take any steps to secure a patent, and another party makes the same invention in the meantime, the first party will lose his right to a patent, and the patent will issue to the second party. This is upon the ground that the first party has lost his right by his own neglect to comply with the law, and make his application.

The protection of a patent is given only upon the condition that he gives the public the benefit of his invention. If he neglects or refuses to do that, and some one else does it in the meantime, the second party who has invented it and proceeded at once to give it to the public by applying for a patent, is the one to whom the patent will issue. It is an old saying, that "a person cannot eat his bread and butter and sell it too;" so a man cannot hide his invention and patent it too. If he will not give the public the benefit of it, then the public is under no obligation to give him a monopoly of it; and he has no reason to complain of this, for, if by his neglect or selfishness, he defeats the object of the law, then surely he has no right to claim the benefit of the law.

While the law scrupulously protects him while experimenting or completing his invention, at the same time it requires of him "reasonable diligence" in making his application; and the courts having repeatedly decided that two years was a sufficient length of time for him, that has come to be adopted as the rule; and the law of 1861 provides that if an applicant neglects for two years to complete his case for examination, after having filed his petition, then it shall be considered as abandoned. All this, however, with the exception of the last mentioned provision of the law of 1861, has relation to cases where a second party makes the same invention and applies for it, the first inventor having neglected for two years to do so. In cases where two parties are busy on the same invention at the same time, unknown to each other, he is entitled to the patent who first made the invention, even though the other completes his machine or model first, and first makes his application. Where but one party makes an invention, he may delay as long as he pleases, to apply for a patent, though of course at the risk of losing it entirely by some other person inventing the same thing and applying for a patent on it in the meantime, as above explained. The only safe rule, therefore, is for the inventor to make his application as soon as possible after completing his invention. And if it is a matter that is likely to consume much time in its completion, then he should protect himself by filing a caveat. This last is simply a brief description of the proposed invention and its operation, accompanied with a drawing exhibiting the nature of the thing, and setting forth what the party intends to claim as his invention. It need not be so full and specific as a specification (as the description in the application is called), but should be sufficiently so that the examiner may comprehend what the invention is. The fee for filing a caveat is \$10. It is filed in the secret archives, lasts for one year, and may be renewed annually upon the payment of the \$10, as long as the party desires; but it must not be allowed to run out for a single hour—if so, all before that time becomes dead, even though the fee be paid immediately thereafter.—W. E. Dodge, in *Prairie Farmer*.

The oldest house in the United States now standing as it was originally built, is the Rev. Dr. Whitegeld's, at Guilford, Connecticut. It was built in 1639. The walls are of stone and the wood work is of oak. The diamond-shaped windows were removed some sixty or seventy years ago, but in other respects the venerable mansion remains in its original state. The elevation of the first story is seven feet and eight inches; the height of the second is six feet and nine inches.

## Mechanical.

## Russian Leather—How it is Made.

The artisans of no other nation than Russia have yet been able to produce an article of "Russian leather" or "Russian iron," which equals, in quality, that which is sent out from the Russian workshops. These inimitable products have long been a puzzle to the people of all other nations. The skill which the Russians have acquired in the production of these useful and durable articles is both honorable and remarkable. Why it is that, with all the skill and inquisitiveness of the Englishman and Yankee, the secret of the Russian success has never been obtained, we will not stop to inquire; but certain it is that the tanners and iron-workers of other nations have not been lacking in their efforts to extract the secret or emulate the product.

The power which the Russian leather possesses of resisting decay in damp places, and its freedom from the attacks of insects and fungi, are remarkable. Persons have repeatedly been there to investigate the process, and returned with the full assurance that they had possessed themselves of the coveted secret; but when the process of manipulation is followed out anywhere else, as closely as observation, under most favorable circumstances, seems to assure them is done there, an inferior quality of leather is always produced. The Russians must either possess some natural advantages, of which they are not themselves aware, or their secret must be a very simple one, and easily concealed.

This leather is prepared mostly from the skins of calves, sheep and goats, although heavy beef skins are sometimes used. The process has been again and again minutely described and in detail. The fullest which we have seen is found in the *Scientific American* of the 25th ult. We have before us pretty much the same thing, but less in detail, which was published some eight or ten years since, and which reads as follows:

It is prepared by tanning the skins of calves, sheep and goats, with a warm decoction of willow bark; the red dye is communicated by a decoction of red sanders wood, and afterward applying by a kind of enrrying process on empyreumatic oil, obtained by distillation from the bark of the birch tree, which gives it its agreeable odor. The hair is said to be loosened by a weak solution of wood-ash lye, of which the active principle is carbonate of potash.

The paper first alluded to pertinently asks if there may not be some special virtue in the Russian vegetable products employed in the process.

**SPEED OF LOCOMOTIVES.**—Fifty-three miles in forty-seven minutes, is said by the *American Artisan* to be the best time ever made by a locomotive for any considerable distance. If our memory serves us right, an English express train once ran about the same distance or greater, at the rate of a mile a minute. Short distances have often been run at the rate of eighty miles an hour; and one hundred miles an hour have been claimed—the evidence of such speed having been obtained is doubtful. It is well known that when great speed is attained, the locomotive bounds, rather than runs along the track—it bounds from every inequality, sometimes making leaps of many feet, without touching the rail at all! The danger from such a motion, after passing the speed of sixty miles an hour, is very great.

**A SINGULAR MODE OF PROPULSION,** by means of a wheel picking up a submerged cable, fast at both ends, is a very old device. There are said to be a number of steam ferries worked on this principle in England up to the present day. This is also said to have been probably the manner in which steam ferries were first worked. The modern device of making the steam the propelling power, probably originated from this idea.

It is stated that 5,600 reaping and mowing machines have been made at Rockford, Illinois, during the past winter.

**HEAVY FORGINGS.**—Several very heavy and unique forgings are on exhibition at the Paris Exposition. The Haswell patent press-forgings, made in Vienna, are exhibited in the Austrian department, including a locomotive cross-head squeezed out of a solid block of wrought iron, even the opening for the connecting rod being pressed in. A locomotive crank, pressed at one operation, is also shown. A very large compressed forging, by Marrel Freres, is a 30-ton marine shaft with three cranks, all forged solid in their positions, instead of being forged in one plane and then twisted, as is usual. Sixty tons of iron were used in forging this shaft, one half the metal being wasted in the process. The piling was done in layers crossing each other at right angles or diagonally.

**WELDING IRON AND STEEL.**—Mr. Bernard Lietaer, of Brussels, gives the following as "An improved method of welding iron upon iron, steel upon steel, and iron upon steel":

One kilogramme of filings of iron or steel; 100 grammes salt of ammoniac; sixty grammes of borax; fifty grammes of balsam of copayva; calcine the whole and reduce to fine powder. For an ordinary solder one of the pieces of iron or steel is heated to a red heat, and after the part to be soldered has been carefully cleaned with a file or wire brush, the above composition is spread upon it, and the second piece at a white heat is immediately placed upon it and welded together. Provisional protection has been secured for this invention.

**THE PHILOSOPHY OF ANNEALING IRON.**—Annealed iron may generally be distinguished by its neutral tint. The application of carbon without oxygen, at a white heat, appears to act like a sponge; drawing to the surface and absorbing into itself the chief part of the carbon in the cast iron submitted to the operation. The withdrawal of this impurity changes the iron so treated from a crystallized to a fibrous structure, so that it becomes more or less malleable. Cast iron car wheels are so treated by several manufacturers, to render them tough.

**TIN CLIPPINGS** of late have become too valuable to be thrown away as has been their common fate. By immersing them in stone tanks (or probably in large wooden tanks) for twelve hours in a mixture of half water and muriatic acid with six per cent. of nitric acid, or as long as a dry and ignited slip shows no tin on the surface, then, after drawing the acid liquor, washed thoroughly with water, and after drying used as old wrought iron in puddling. The tin is removed from the acid solution by precipitation with metallic zinc, and the spongy precipitate after draining mixed with some oil or fat, and melted down.

**STEEL BOILERS.**—The Paris and Orleans railroad has thirteen locomotives with steel boilers—the Southern has fifteen, and the Paris and Secaux has a number. The substitution of steel for iron in this direction is making rapid progress, notwithstanding the doubts as to its utility and economy, which have been put forth by several eminent English engineers.

**THE ELASTICITY OF IRON.**—Tredgold says that the destruction of the elastic power of iron manifests itself when the load exceeds one-third of its breaking weight; but Hodgkinson and others claim that such an effect is produced, and a permanent "set" is often established when the load does not exceed one-sixteenth of the breaking weight.

**PREVENTION OF FIRE.**—Houses, it is asserted, may be made almost entirely fire-proof by filling up the space between the walls and under the stairs with lime and finely broken bricks or gravel. In France they use plaster of paris and broken stone. Mud and brickbats will in fact answer every purpose. The greatest cause of destructive fires is the draught produced by these hollow spaces.

**STRENGTH IN FORM.**—Although cast iron columns are usually made of a regular taper from base to top, still the strongest form for such supports, consistent with a given weight of metal, is that of a double cone, making them thickest in the middle.

## Scientific Miscellany.

**MOVEMENT OF SOUND.**—It is stated in the English papers that Mr. Mallet has ascertained, from observations made during some recent blasting operations at Holyhead, that the louder the report the more rapid was the progress of sound through the air. With 2,000 pounds of powder, the sound of the report traveled at the rate of 967 feet in a second; while with a charge of 12,000 pounds, the sound traveled at the increased rate of 1,210 feet. Absolute precision in such observations is very difficult. The books tell us that sound travels at the rate of 1,142 feet a second. Owing to the difficulty of accurate observations, no two observers could probably arrive at precisely the same result. Whatever the rate may be, it is doubtless constant under the same atmospheric conditions. With the wind blowing toward the observer, the speed would be greater than with the wind blowing from him, or during a calm, as the sound-waves would themselves be carried along by the current, in the former case. Again, the speed would vary with the greater or less density of the atmosphere. An atmosphere loaded with vapor would transmit sound more rapidly than a light, dry atmosphere. Hence, the probability is that the variations in Mr. Mallet's observations are due to some of the causes named, and that the theory hitherto received, of the constancy of sound, under similar conditions, is still to be received as correct philosophy.

**FORCE OF HEAT BY EXPANSION.**—It has recently been ascertained that a bar of malleable iron of one inch sectional area is stretched one ten-thousandth of its length by the pull of a ton weight. It has also been ascertained that a similar elongation is produced by heating the bar 16°. The same bar may be contracted one ten-thousandth of its length either by cooling 16° or by a pressure of a ton weight. Such experiments show how enormous are these silent forces, and how irresistible and terrible they must be against the feeble strength of man. Yet it is so ordered in nature that they act only a beneficent part. The gentle wind, the refreshing rain, the changes of seasons and the flow of rivers, are only a few of the many natural phenomena which are dependent upon the force of expansion by heat.

**CARBONIC ACID BATHS.**—At Piermont in Germany, there is a natural spring of carbonic acid gas, the sides of which have been walled up, and steps have been laid for entering it. The well is shallow, and the gas fills it to a depth of about four feet, so that the gas rises about to the middle of a person standing in the well. Carbonic acid, in contact with the skin, produces a peculiar prickling sensation, and people visit Piermont for the purpose of taking a carbonic acid bath. The keeper makes a practice of blowing soap bubbles, which fall through the air, but which rest upon the surface of the heavier gas, and dance up and down as the gas is agitated.—*Exchange.*

There is a spring of the same kind at the New Almaden Quicksilver mines in this State, walled and plankd up, with steps leading down into it. Whether it is ever used as a bath or not, we do not know; but it might be.

**A NEW ALLOY** has been introduced in Paris, under the name *Turo-argent*, or trisilver. It is composed of 33 per cent. silver, 25 to 30 per cent. of nickel, and 37 to 52 of copper. The compound is not homogeneous, but is rendered malleable by a secret process. In color it is similar to platinum, takes a high polish, is extremely hard, and is not affected by exposure to the atmosphere.

**DR. RICHARDSON** states that iodine, placed in a box with a perforated lid, destroys organic poison in rooms. In case of small pox he has seen the method used with great benefit.

**THE PHILOSOPHY OF THE PREVENTION OF BOILER INCORUSTATION BY ELECTRICITY.**—At a late meeting of the Polytechnic Association of the American Institute, at New York, Prof. Van der Weyde explained the action of electricity in preventing boiler incrustation in the following manner:

He had found by experiments, that deposits in steam boilers are positively electrified. This he had ascertained by having an isolated wire attached to a metallic plate—receiving deposits upon this plate—then connecting it with an electrometer which indicated positive electricity, and when positive electricity was discharged from this metallic plate into the liquid by some proper means the deposit or crystallization was effectually prevented. If, therefore, the positive electricity of the steam was conducted to the bottom of the boilers it would repel the deposits. Then all that is necessary is to collect upon the shell of the boiler this positive electricity, so that it can discharge into the water at every place where the boiler is in contact with the water. His plan is to place in the state-room or steam-drum of the boiler a number of downward pointed lightning rods with their base ends forming a metallic connection with the boiler. These points will absorb the positive electricity of the steam, communicate it to the shell of the boiler, from whence it will naturally discharge in the water, wherever the boiler is in contact with the water, and everywhere repel the electro-positive deposits, so that these are continually prevented from settling and are kept in suspension in the water, and from time to time may be blown off.

The relative moisture in the air of a room may be very correctly arrived at by the simple expedient of placing a few grains of quicklime on a plate and exposing it upon a table. If it does not absorb more than one-fortieth of its weight of moisture, the room is not over damp for health. In a damp, newly plastered room, it will sometimes absorb one-twentieth of its original weight.

**EFFECTS OF PRESSURE ON FREEZING WATER.**—M. Mousson has discovered the interesting fact, that a powerful pressure not only retards the freezing of water, but prevents its complete solidification. The pressure opposes the tendency of the water to expand on freezing, and thus virtually lowers the point of solidification.

**ALLOYS OF STEEL WITH PLATINUM** are said to be very perfect in every proportion that has been tried. The best proportion for edge instruments is about one-fifth per cent. of the latter metal. Equal parts by weight form a beautiful alloy which takes a fine polish and does not tarnish; the color is the finest imaginable for a mirror.

**OIL OF IRON.**—When cast iron is dissolved in dilute sulphuric acid, a peculiar oil is also formed. This substance has long been a puzzle to chemists. Chevreul, the French chemist, has stated that perhaps nitrogen was a constituent of this oil, but late investigations by Professor Cameron, of Dublin, and Emerson J. Reynolds, of London, have conclusively settled the question as to its identical character. It contains no nitrogen; it is chiefly composed of carbon and hydrogen.

**THE AIR TREATMENT.**—M. Boisson has introduced a method of treating superficial wounds by a jet of air from the common bellows, immediately forming a dry film over the exposed flesh, beneath which healing is greatly facilitated and other obvious advantages secured. Burns which have removed the skin may be treated advantageously in this way.

**HON. M. P. WILDER**, of Massachusetts, has discovered that pencil marks on strips of zinc for tree labels, which can readily be rubbed off when first written, grow more distinct and durable with age, and after a few years can only be erased by scraping.

All kinds of soft, porous stone become hard by white-washing them with fresh-slacked lime. The lime absorbs carbonic acid from the atmosphere, and is converted into carbonate of lime. A portion of this remains in the pores of the stone, and ultimately becomes marble.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

64,534.—AMALGAMATOR.—Andrew Hunter, San Francisco, Cal.:

I claim, 1st, The box, A, with sides and ends lined with copper, in combination with the blocks, B, B, and sides, C, C, substantially as described.

2d, The frame, E, with shoes or mullers, D, D, suspended to frame, F, by rods or bars, G, G, or their equivalents, worked by rod, J, and crank or eccentric, K, as hereinbefore set forth.

3d, The movable frame, F, with adjusting screws, I, I, or their equivalents, for adjusting mullers, D, D, to any desired height.

4th, Covering the tops of the mullers, D, D, with copper.

5th, Box, L, with frame, M, set with skimmers and agitators, substantially as described and for uses and purposes as hereinbefore set forth.

6th, Table, O, with steps covered with copper plates, with side vibratory motion as given by driver, P, and rod, Q.

7th, The box, A, lined with copper plates in combination with blocks, B, B, dies, C, C, mullers, D, D, adjusting or movable frame, F, screws, I, I, rod, J, crank or eccentric, K, box, L, and frame, M, with agitators or skimmers, substantially as described and for the uses and purposes as hereinbefore set forth.

8th, The last described combination in connection with the table, O, with its side vibratory motion, substantially as described and for the uses and purposes as hereinbefore set forth.

64,554.—FRICTION PAWL.—Joseph Moore, San Francisco, Cal.:

I claim a stop apparatus for hoisting machinery, constructed with the pawls, Q, Q, moving with the shaft, F, and the ratchet-case, R, turning loosely upon said shaft, together with the brake-beam, L, L, levers, T and V, and weight, Z, constructed and operated substantially as and for the purposes described.

The nature of this invention is a device for the use of a friction-clutch and pawl in connection with a hoisting gear, in order to guard against accidents, and so constructed that the hoisting wheel may be turned easily in a direction to raise the weight; while by means of pawls inside of the ratchet-case and frictional brake-beams the load may be stopped at any desired point with perfect security and safety.

64,558.—IMPROVED POT FOR MELTING GLASS. Carlton Newman, San Francisco, Cal.:

1st, I claim a pot, A, constructed with the opening, F, and flues, D, D, or their equivalents, substantially as and for the purposes described.

2d, The flues, H, H, or their equivalents, constructed and arranged substantially as and for the purpose described.

The nature of this invention is to provide a pot for melting glass, which combines the qualities of a covered pot for making superior glass with those of an open pot for making inferior glass quickly. A full description of the character and merits of this invention was given on page 280 of the present volume of the Press.

64,762.—AN IMPROVED ANCHOR STOCK.—John Lake Hanly, San Francisco, Cal.:

I claim an anchor stock, C, in combination with the permanent flange, e, and movable key, D, substantially as and for the purpose herein set forth.

The object of this invention is to provide an improved anchor-stock, to obviate the evil of breaking off at the point where the key passes through to secure the shank. In order to accomplish this, the inventor makes a key-way in one side of the opening of the shank, through which the stock passes, and welds on the stock a flange, at such a distance from the shoulder as to let the stock turn after the flange has passed entirely through. By turning the stock one-fourth or more of the circumference a key-way through the shoulder is brought in a line with the one in the shank, so that a key may be inserted to keep the shank and stock in their relative positions.

64,781.—LOW WATER INDICATOR.—George McAllister, San Francisco, assignor to himself and Chas. B. White, of the same place:

I claim a water gauge, composed of the float, J, arms, I, parts or case, A, B and C, and passages, D, D, constructed substantially as and for the purposes described.

This invention relates to an improvement in that class of gauges designed to indicate the level of the water in steam boilers, and consists of a hollow steam-tight case, composed of a central hub, the space enclosed by two radial lines extending from this hub to the circumference of a circle of the proper size for the index or scale. Within this case is an arm moving about an axis in the center of the hub, and having at its outer extremity a hollow float. An indicator is placed on the end of the axis, outside, and corresponds with the position of the float on the inside. Steam and water are admitted to the case by pipes connecting with the steam and water space in the boilers, so that the position of the float, and consequently the height of the water, is easily ascertained at a glance.

## RECENT INVENTIONS.

ANOTHER SAN FRANCISCO INVENTION IN NEW YORK.—The New York *Shipping List* speaks as follows of a new boat detaching apparatus: "Among the multiplicity of inventions designed to save life at sea in time of disaster, we have seen nothing more meritorious than the 'Boat Detaching Apparatus,' invented by Messrs. Peterson & Gunner, of San Francisco, the same parties who lately exhibited the 'Patent Self Reefer and Furler' in this city. The great advantage of their detaching apparatus, now being examined and tested by the Life Saving Commission, is its great simplicity and the small amount of space it occupies in the stern of the boat. The boat can be detached instantaneously by raising a small lever, the person occupying a seat in the stern not being obliged to move from his position, thus obviating confusion among the passengers in times of peril. This apparatus has the endorsement of the eminent ship-builder, Henry Steers, and other practical men, which is the best recommendation of its general worth and utility."

A VERY simple machine has been recently devised, which consists of a rotary fan drawing a powerful current of air through a case or chamber packed with sponges, which may, if desired, be saturated with any purifying, ozonizing, or freezing mixture, and thus a cool, fresh, or, if you please, perfumed breeze may be enjoyed in any situation and at any season.

NEW ELEVATOR.—The *Colorado Times* speaks of having seen the model of a newly-invented elevator for the mines, which the editor thinks might be valuable; but he gives no intimation of the principle on which it is constructed.

A CYPHERING MACHINE.—Samuel J. Kelso, of Detroit, Mich., has invented a machine which can be used for adding, subtracting and multiplying figures of any desired magnitude, with the greatest ease and facility.

A CITIZEN of Troy, New York, is at work on a pasteboard shell boat, which will weigh less than forty pounds, and be perfectly impervious to water, by a new chemical preparation invented by its maker.

A NEW CORKSCREW AND CORK.—M. Gusselt, the great champagne wine maker in France, has invented a new style of cork and corkscrew, by which a glass of champagne can be taken from a bottle without injuring the remaining contents. Thus this perishable wine can henceforth be enjoyed in a small quantity without the waste of a whole bottle.

NEW INCORPORATIONS.—Articles of Incorporation have recently been filed in the County Clerk's office in this city as follows:

June 8th.—Consolidated Virginia M. Co. Comstock Lode, Virginia City, Nev. Capital stock, \$2,320,000; 1,160 shares, \$2,000 each. Trustees: Wm. E. Barron, Frank Livingston, L. Sloss, A. P. Crittenden and S. Heydenfeldt.

June 5th.—North Pacific Fur Co., to trade in the country and islands of the North Pacific. Capital stock, \$1,000,000; 100 shares. Trustees: Lloyd Tevis, J. Mora Moss, L. L. Robinson, W. C. Barron and S. F. Butterworth.

ELECTION.—SHOSHONE S. M. Co.—June 12th. Trustees: Henry Carlton, Jr., S. R. Harris, H. W. Cleaveland, S. A. Chapin and David Wilder. President, Henry Carlton, Jr.; Secretary and Treasurer, David Wilder; Superintendent, M. J. Goodfellow. Office, 529 Clay street.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, }  
JUNE 15, 1867.

## CITY STOCKS.

We note a little more activity in City Shares; however, the offerings exceed the demand. Sales of North Beach and Mission R. R. were effected at \$50 per share. The usual monthly dividend of  $\frac{1}{2}$  cent. on its capital stock is payable to-day. Spring Valley Water Co. sold at \$66.50 per share. On and after the 10th inst., this company disbursed its usual monthly dividend of  $\frac{1}{2}$  cent. California Steam Nav. Co. realized 63 cent., seller 30, and Fireman's Fund Insurance Co. obtained 93 cent., or \$9.30 per share. The usual monthly dividend of the Bank of California (1 cent. on its capital stock of \$5,000,000) is payable to-day. Private sales of Front Street, Mission and Ocean R. R. have been made at \$15 per share. Up to the 1st inst., 9,000 shares have been issued out of the 10,000 shares of which the company is composed. We quote Omnibus R. R. at 59 bid and 60 asked. The usual dividend of  $\frac{1}{2}$  cent. is payable to-day. The South San Francisco Railroad and Homestead Association pay a dividend of \$200 per share to-day, the same being earnings from premiums paid on lots at a recent sale.

## MINING SHARE MARKET.

The very decided upward tendency of Mining Shares during the past week is a sufficient explanation of the increased productiveness of the Comstock lode, and though most shares may be somewhat higher than their intrinsic value, we may safely look for a continuance of the present activity. The sales have been larger than ever before, and it is exceedingly gratifying that "wildcat," as in former times, is no feature whatever of the market.

SAVAGE—has been sold at a marked advance since our last reference, opening at \$3,800, rapidly improving to \$4,500, and closing yesterday at \$4,500. During the week ending June 8th, 1,918 tons of ore were taken from the mine, showing an estimated value of \$86,062, or \$44.82 per ton. A recent exploring drift eastward from the north mine, at a distance of 72 feet from the main body, unexpectedly reached a new body of ore which was found to be twelve feet in width, and of a fine quality. The best informed say that unless this is a continuation of the old North Potosi chimney, (and it is far from being underneath that ore), it must be an entirely new body of ore, untouched from any other point. Under all circumstances, it is reported that enough ore has already been developed to warrant the assertion that it is the most important discovery made within a year. The position of this drift, in point of level, is midway between the sixth and seventh levels, and preparations are now being made to explore this newly discovered body of ore from both of these levels, and also to ascertain how far it extends toward the south. We learn that the southwest drift on the third level is in rich ore. The receipts of bullion in the month of May amounted to \$408,000, leaving a surplus of \$110,000 after the payment of the last dividend, amounting to \$160,000. HALE & NORCROSS—has been offered at \$3,300. We learn of no material change in this mine. On the 7th inst., the shaft was down 430 feet.

YELLOW JACKET—has been sold at greatly improved figures, and exhibits considerable firmness at the close, opening at \$1,800, advancing to \$2,030, and closing at \$2,000. We are informed that the developments in the lower levels of this mine are very flattering, particularly in the north mine.

CROWN POINT—also shows a material advance over closing sales of last week, improving from \$1,680 to \$1,900, and closing yesterday at \$1,975. The ore raised from the mine during the week ending June 7th, amounted to 611 tons, 526 tons of which came from the 400-foot level, and 85 tons from the 500-foot level. The developments on the east vein, 500-foot level, extend north and south some 60 feet. In a southerly direction the vein maintains its former width, but in going north it has a tendency to grow narrower. A winze has recently been started on this body of ore. The west drift in the same level is in 165 feet, and running in hard rock. The shaft is now 84 feet in depth

from the 500-foot station. The average product of the mine is about 90 tons per day.

GOULD & CURRY—suddenly took an upward tendency, but declined as rapidly, advancing from \$540 to \$850, dropping to \$600, then selling at \$650, and at the close obtaining \$680. The appreciation of this stock early in the week was principally based upon the developments made in the Savage mine, at a point about 200 feet south of the Gould & Curry line, and on the 600-foot level.

CHOLLAR-POTOSI—has been in rather less favor, declining from \$540 to \$465, rallying to \$500, receding to \$470, and closing at \$480. The Blue Wing level is said to look well, both in the "raise" and at the south end, and it is thought that the ore in this level will not be exhausted for months to come. In the third or Santa Fé level, little has been done during the past week, and we have nothing new to report. Owing to the hardness of the rock, the sinking of the shaft progresses slowly. During the week ending June 8th, 2,870 tons of ore were shipped to custom mills. A typographical error in our last issue made the assay value of the ore recently found east of the Chollar timbers \$13 per ton instead of \$73. A dividend of \$25 per share is payable to-day.

KENTUCK—exhibited considerable activity, at enhanced rates, during the week under review, opening at \$455@475, then selling at \$450, ex-dividend, advancing to \$500, seller 3, and closing at \$545. The bullion returns from the 1st to the 11th instant aggregated \$22,832.17. From a very full report of the present condition of this mine, made by C. A. Luckhart, mining engineer, May 29th, 1867, we obtain the following statement of the amount of ore at present in sight:

Ret. 1st and 3d stations...	2,700 tons, which will mill	\$30 00
Ret. 1st and 3d stations...	3,500 "	" " 45 00
Above first station.....	20,000 "	" " 32 00
Below third station.....	17,500 "	" " 35 00
Below third station.....	5,000 "	" " 45 00
Below third station.....	6,400 "	" " 37 00

Making a total of.....55,100 tons, which will mill \$57 87

BELCHER—also shows a very decided improvement, gradually advancing from \$400 per foot to \$490, and closing yesterday at \$545. OREER has been largely dealt in, at fluctuating rates, advancing from \$270, seller 3, to \$360, falling to \$320, rallying to \$350, receding to \$325, and closing at \$325.

OVERMAN—during the past week has been the most active on the list, over 2,000 shares having changed hands, rising rapidly from \$135 to \$240, and closing yesterday at \$260. By telegraphic dispatches, we learn that two shipments of bullion have been made to the office in this city, the first amounting to \$3,300, being the product of 75 tons of ore, equal to \$44 per ton, and the second, \$5,800, being a partial clean-up of 115 tons, showing a yield of \$50 to the ton. It is said that they are now obtaining an abundance of ore, and in all probability will pay a dividend next month.

IMPERIAL—has been sold at a considerable decline, gradually receding from \$197.50 to \$185, rallying to \$190, and at the close selling at \$205, b. 3. The first clean-up of the Rock Point mill for the current month aggregated about \$13,000 in bullion. A dividend of \$10 per share is payable to-day.

EMPIRE—has been in slight request, selling at \$160@163. The receipts of bullion during the month of May amounted to \$21,933. They raise, on an average, 1,500 tons of ore per month, and reduce about 1,000 tons in a like period. Two feet of ALPHA sold at \$400 per foot. We quote GOLD HILL Q. M. & M. Co. at \$160 bid. A dividend of \$10 per share is payable to-day.

CONFIDENCE—rose from \$55 to \$77.50, and closed yesterday at \$77.50. BULLION declined from \$48 to \$36, rallied to \$39, and at the close sold at \$50. An assessment of \$10 per share was levied on the 4th inst. DANEX receded from \$29 to \$22. SIERRA NEVADA sold within a range of \$10@13, and closed yesterday at \$10. EXCHEQUER closed at \$11.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,725,032.

THE AMERICAN NATURALIST.—We have received two or three numbers of this valuable monthly, published by the Essex Institute, of Salem, Mass. It is full of useful matter, beautifully printed, and illustrated with very superior engravings. It numbers among its contributors the most eminent naturalists of the country, and fills a vacuum in the list of American scientific publications, which it is to be hoped will never be again neglected.

## ORE CONCENTRATOR FOR AUSTRALIA.—

One of Hendy's patent concentrators, was forwarded by the last steamer for Australia, via Panama.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEVER & Co., office Mining and Scientific Press, San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner*, June 1st: The Mowyer Co., since the first 100 ft. of tunnel made, have encountered extremely hard rock, which somewhat discourages stockholders, though there are symptoms of a near approach to the ledge or soft rock.

The timbers for the Tarshish ore house are ready to raise.

The Ringgold & Goldfinch Co. are now in quartz running from the west wall. Some of the quartz looks extremely well. The rock is very hard, and but slow progress is made.

June 8th: Charley Mauk, a stockholder in the Buckeye No. 2, Silver Mountain, recently took to Virginia City, Nevada, a specimen of the Buckeye, which assayed, gold and silver, \$300 per ton.

This week, the workmen on the Mowyer struck through into a softer strata, through which water comes in large quantities from some fountain-head, supposed to be the ledge. An old millman from Virginia City visited Alpine, this week, and, after examining the mines and ores, states that, with good management, the mills could be made to pay well.

The Jennings lode is being worked. The location consists of 600 ft., and is thought to be identical with the Oconto claim.

The workmen in the Balaklava tunnel have struck a vein of ore about eight in. thick, which resembles the Morning Star.

The Pennsylvania Co. have resumed operations.

## Butte County.

From the *Oroville Record*, June 1st: C. M. Ury has some specimens of valuable looking quartz taken from a ledge in Lincoln Dist., Mountain Spring Township. The ledge was discovered about a year since, and has prospected as high as 10 cts. per lb. A shaft has been sunk some 30 ft., the vein widening at the top from 18 in. to three ft.

G. W. Taylor has commenced piping in his claims at Gravel range. It is working four men at present, but will have another set of hands soon. C. Houghtailing and P. P. Stoker are working the claim of D. Chapland. This claim has been worked for several years, and still pays well. Further up, toward Willow creek, on what is called China Gulch, are several companies hard at it. The gold is coarse, and sometimes pays well. A company of Chiuamen took out over \$10,000 from this gulch within the last two years. Geo. McDougal and Jim Downs are working here, besides a number of others. The snow is very deep here yet—from 5 to 20 ft.—but is going very fast.

At Kellogg's diggings there are only two men at present. On Bear Gulch there are two or three companies from the Green Isle, busy sluicing. Sky High diggings, once so famous, seem about played out. The Mammoth ledge, owned by Joel Spitzer & Moore, is from 8 to 12 ft. wide on top. The owners talk of sinking a shaft 100 ft. deep and testing it thoroughly.

## Calaveras County.

There is quite an excitement at Copperopolis over the discovery of a rich quartz vein, which prospects from \$50 to \$60 per ton all the way through.

The owners of the Finnegan mine, at Carson Hill, have struck a rich pocket, said to contain from \$80,000 to \$100,000 in gold, and have, in addition, a well-defined quartz vein, which yields well.

## El Dorado County.

Placerville *Courier*, June 8th: Rich rock is being taken from the Shepherd mine, some pieces containing over a pound of gold. From the proceeds of 125 tons of rock, a mill has been erected, and the mine thoroughly opened.

## Inyo County.

Charles F. Derval writes from Independence, Inyo Co., to the Nevada *Trepass*, May 7th: The shipment from this camp last week amounted to 68 lbs., with only four furnaces of small caliber to work with. There is a gold ledge  $2\frac{1}{2}$  miles from here, which is worked by an arastra. It pays from \$100 to \$300 per ton. The gold is worth \$18.60 per ounce. I sent a man to locate both extensions, in case the indications are as good as in the original, and it will pay from the top. There is plenty of water, etc. This is the richest mineral section on the coast.

The *Trepass* adds: Three hundred lbs. of ore from the San Felipe produced  $38\frac{1}{2}$  ozs. of silver; 200 lbs. from the Mexican produced  $40\frac{1}{2}$  ozs. of silver; 300 lbs. from the Republican produced 48 ozs. of silver. The

same amount from the San Judas produced 104 ozs. of silver, and 75 lbs. from the same ledge, No. 1, yielded 136 ozs.

## Nevada County.

*Transcript*, June 8th: Some six or eight ledges are being worked in the vicinity of Eureka, with excellent prospects. Three mills are in operation, and it is probable that two or three new ones will be erected before fall. Booth & Co's mill is at work crushing rock from the Liberty ledge. This lead is from two to ten ft. wide, and yields from \$20 to \$22 per ton, the latter being the amount obtained at the last working. The claim has been prospected 90 ft. in length, and the rock looks first rate.

Black & Co. have a fine ledge. The mill is kept in constant operation, and the rock yields handsomely.

Considerable prospecting for quartz is being done between Eureka and Moore's Flat. The Chico Co. have taken out 1,000 lbs. of rock, which has been shipped to this city, to be worked at Palmer's mill. The Grizzly Co. are going to erect a new mill. Several other companies are prospecting.

There is a prospect that a large amount of bullion will be obtained from the ledges in this section of the county before fall.

*Gazette*, June 6th: Murphy & Co., of the Homestake, Myers' Ravine, are hauling rock to Palmer's mill, which will be crushed in a few days. The rock looks well, being highly charged with sulphurets, and containing considerable free gold. They have out some 30 or 40 tons, and the ledge where they are now working is between three and four feet wide. Not long since an interest in the ledge was sold at the rate of \$12,000 for the whole.

A mining company at Omega are making arrangements to use nitro-glycerine in blasting. It is claimed that it has three times the explosive force of powder, pound for pound.

J. T. Stratton, who has been appointed to survey quartz mines in Nevada county, under the law of 1866, commenced, on Wednesday last, by surveying the claims of Dewey & Co., at Newtown.

*National*, June 5th: The Dromedary ledge is still exhibiting fine indications. This morning rock was taken out which showed an abundance of free gold and sulphurets.

*Excelsior*.—*Transcript*, June 1st: A large number of ledges are being worked in the Meadow Lake Dist., and the prospects never looked better. The deeper the ledges are worked, the better they appear. A. L. Stiles has commenced suit against the Enterprise Gold and Silver Mining Co., of Meadow Lake Dist., to compel the officers of the company to issue to him 225 shares of stock, which he purchased of J. S. Battersby.

Meadow Lake *Sun*, June 6th: The Excelsior Co. are remodeling the old works of their mill. They are now getting out some fine rock, in which free gold may be seen with the naked eye.

## Placer County.

Auburn *Stars and Stripes*, June 5th: The work on the Washoe claims is being done midway between Bath and Michigan Bluffs, directly opposite Mt. Gregory. These ledges are four ft. thick, all have been prospected quite extensively, and in no case has a less yield than \$28 per ton been realized. The narrowest ledge is  $3\frac{1}{2}$  ft. thick. By working test, the rock from this ledge yields \$300 per ton. Several lumps crushed in a hand mortar, and washed with great care, yielded extremely rich prospects.

As Superintendent for Goddard & Co., of San Francisco, who lately purchased the Washington mine at Smith's Point, Mr. John Tregloan has erected a 10-stamp mill on those claims, which has been in active operation for several weeks with every indication of remunerative results.

The Westchester, owned by Gen. McDowell, B. M. Hartshorn, W. H. Sears, and others, is having a 10-stamp mill erected, to be run by water power, and will be ready to run this month.

Five tons of quartz taken from a vein running through Yankee Jim, was crushed last week, and yielded a sufficient amount per ton to warrant the further development of the vein, which is eight ft. wide (carrying gold bearing sulphurets), in a good locality for cheap and permanent working.

*Enquirer*, June 8th: James Taef and Collector Miller have purchased interests in the Redstone, Champion and Blue Bell.

From the Grass Valley *Union*, June 5th: At Dutch Flat last week, Carr, Moore & Harriman, after a 19 days' run, during which time only four men were working in their claim, near Gold Run, cleaned up \$2,720. The Home Ticket Co., also near Gold Run, obtained \$2,068. The Harkness claim, located near Cañon Creek, cleaned up on Wednesday, after a run of 23 days, realizing the handsome sum of \$4,250.65.

## Plumas County.

*National*, June 1st: Prime and others have discovered good placer diggings on the north side of Genesee Valley. The first two days' ground sluicing paid \$4 to the hand. They are now digging a ditch so as to work the ground to better advantage.

The Pennsylvania quartzmill, near Greenville, owned by Mr. Judkins, was put in operation on Monday last. The mill has lain idle about nine months, pending litigation.

The claims of Reynolds & Madden at Black Hawk, are now paying as high as a dollar to the pan. The claims of Rice & Co. are yielding very rich returns. It is expected that a large amount of money will be taken from these claims this season.

Light & Bro., at Genesee Valley, have completed their new mill, and started it in operation last week. We expect soon to hear of a big clean-up, as they have a large amount of good quartz on hand.

The new mill of Judkins & Kellogg, Round Valley, is ready for operation, and will commence crushing a large amount of quartz, which has accumulated.

Thomas Conley has sold his interest in the New York Co's claims, at Sawpit Flat, to Robert Oliver, for \$3,400.

The Eagle Co's claims are paying largely.

*Quincy Union*, June 1st: About two weeks since, Messrs. Bolyer McDougal & Co., who are at work on French Ravine, near Rich Bar, found a small slug of gold in their ground sluice, which weighed  $56\frac{1}{2}$  ozs., valued at nearly \$1,000.

*National*, June 8th: David Haun, while working in the claim of Burge, Simmons & Co., on Mill Creek, picked up a specimen of gold weighing seven ozs.

The Pennsylvania mill has been purchased by H. C. Bidwell for \$5,000. He intends moving it to the Caledonia ledge immediately.

Mr. Westcott is engaged in moving a mill, formerly owned by J. D. Compton, Round Valley, to the Kitts ledge, which has lately been purchased by a New York company through their agent (Mr. Westcott).

Kellogg & Judkins have a number of men employed on a ditch, which is to carry water from the reservoir to this mill.

## Sierra County.

Mountain *Messenger*, June 6th: Rich quartz has been struck in Gibson Creek. Several companies have been organized for the purpose of prospecting certain ledges believed to be rich. A new town has lately been surveyed off in the vicinity of the famous Von Humboldt quartz mines.

## Solano County.

Vallejo *Recorder*, June 8th: The mines now working and shipping coal, are the Black Diamond, Union, Pittsburg, Independent and Eureka.

The Mount Hope Co. have a mine open in the vicinity of the Black Diamond, and are preparing to take out coal largely.

The Central and Teutonia Cos. are not at work at present.

## Tulare County.

The Visalia correspondent of the *Times* of this city says: On Tule river, several copper leads are being opened and prospected. But little is being done in the way of mining at Havilah, although several rich ledges have lately been discovered. A specimen of decayed quartz from a new ledge showed particles of finely divided gold. The discoverer of the ledge has refused \$18,000, and asks \$30,000 for the claim.

## Tulolumne County.

The Sonora correspondent writing to the *Alta*, June 2d, says: The Supt. of the Davidson mine has advertised for proposals to sink 20 or more feet in the shaft, for running 20 ft. in the Tulolumne drift, etc., specifying a dozen different shafts, drifts, stopes, etc.

The total yield of the Sophia mine has been \$45,000.

The Nonpareil mine is filled with water, and is standing idle. The vein is five ft. wide, and the ore worked from \$13 to \$40 per ton. The sulphurets are abundant, and contain from \$40 to \$150 per ton.

The Burns mine is paying well. The company intend to add five more stamps.

The average yield of the Golden Rule mine is from \$10 to \$12 per ton. The vein is eight ft. thick, and easily worked.

*Sonora Herald*, June 1st: The Laurel mill, 11 miles from this place, was destroyed by fire on Tuesday night last. It was the work of an incendiary.

## COLORADO.

From the *News* of May 22d: H. C. Justice has made a sale of 19 silver lodes, located at Argentine, to a Cleveland Co. for \$30,000.

An assay of ore from the Watertown lode, Georgetown Dist., shows a yield of silver of \$4,110.75. The lode is situated near the Anglo Saxon, and is owned by Anderson, Rogers and others.

*Times*, 21st: An assay of 250 lbs. third

quality Adeline ore, Central Dist., run in Phelps' terrace furnace, yielded at the rate of \$21.60 per ton. From  $3\frac{1}{2}$  cords of gold bearing quartz, taken out of John Wendel's claim, No. 1 east on the Gunnell lode, Enreka Dist., at a depth of 140 ft. there was taken 58 ozs. and  $14\frac{1}{2}$  pwts. of gold retorted, worth in currency, \$1,232. It was run in Wendel's mill. The East Boston lode is a vast excavation 16 by 10 ft. and 140 ft. deep. The lower wall is well defined from the top, and the upper one has but just come in, so that there is a space of 10 ft. between walls, with iron pyrites mixed throughout the entire mass. Some of the ore resembles the Gunnell in appearance. There is a rich streak of black pyrites about half way down, which is apparently a cross lode.

From the Marysville *Appeal*, June 7th: The Colorado gold ores are to be attacked by the Welshmen. A large lot of these difficult sulphureted ores have been taken out to Wales and there reduced with such success that capital has been raised to bring out Welsh smelters and put up extensive works on the successful plan in Colorado.

## IDAHO.

From the *World*, May 27th: Miners at Beaver Creek and Walker Camp, at Gold Hill, are making \$20 per day to the hand. A clean-up, after a two weeks run at the Elkhorn mill, on 160 tons of their ore, yielded 690 ozs. retorted gold, valued at \$15 per oz., \$10,350.

May 29th: The tunnel in the Hayes & Ray ledge of 400 ft. is completed. The company have rented the Lincoln mill.

The difficulties over the ownership and possession of the celebrated Poorman mine of Owyhee, have been settled, and the mine and property have gone into the hands of the new company which takes the place of the New York and Owyhee Mining Co. The company have purchased the Empire ledge, which crosses the Poorman.

The Grey Eagle ledge, lately discovered in Yuba Dist., has created much excitement. So far as developed it is the largest and richest silver ledge ever found. A tunnel has been pierced 140 ft.; at 120 ft. the ledge was struck. To the tunnel, a shaft of 140 ft. has been sunk, and the ledge was dug into eight ft. and yet its full width had not been reached. Assays of the ore have yielded from \$2,000 to \$3,000 per ton. Ore containing above 60 per cent. of the pure metal had been taken from the ledge. It is beyond question, the most extraordinary silver ledge ever yet discovered, and seems destined to cast even the famously rich Poorman mine of Owyhee into the shade.

Lewiston *Journal*, May 18th: Coleridge & Co. at Gnat Creek, took out last week \$328. The King quartz mine from 65 tons, cleaned up \$2,600. Their tunnel is in 325 feet.

May 25th: Expressman Fettes has arrived from Pierce City, bringing with him 200 ozs. of gold dust, making \$12,000 this season from that camp.

Companies at Gold Creek, Palouse, are taking out \$6 to \$7 to the hand. The gold is coarse and does not have the appearance of having been washed much. It is the opinion that there must be a rich quartz lead in the vicinity.

From the Owyhee *Avalanche*, June 1st: The tunnel of the Poorman is 800 ft. in length, and its intersection with the South Poorman shaft is 250 ft. below the surface.

Work on the Silver Monarch ledge has been recommenced. A shaft is down 25 ft. A vein of quartz is shown two ft. in width. The Oro Fino and Morning Star Co., from a rough clean-up of 50 tons of ore, realized \$1,704.56. If a close clean-up had been made, it would have given \$40 per ton. There is full five ft. of quartz in the ledge.

Ford & Gafford, of the Owyhee G. & S. M. Co., have leased the Lincoln mill, and are repairing it. It is estimated that \$100,000 will be taken out of Long Gulch this season. The Woodstock Co. have temporarily suspended work; cause, too much snow.

The Leviathan ledge, Flint Dist., is yielding ore beautifully streaked with ruby silver. A new and unprecedently rich ledge has been discovered at the head of Purdy Gulch.

## MONTANA.

From the *Gazette*, May 25th: The Cañon lode, Cañon Dist., rises 60 ft. above the level of the creek, a solid column of quartz 40 ft. in width at the base. The quartz is of a grayish white color, and very easily worked. It is entirely free from base metals.

The Rock Creek ledge has a 14 ft. crevice. The Morrison has one wall rock, and five ft. of quartz exposed. The S. Allen has a crevice  $3\frac{1}{2}$  ft. wide. The Black Prince, which works \$96 per ton silver, has a five foot crevice.

At the depth of 24 ft., ore from the Sam Gaty lode assays \$193.20 per ton. The

crevice at the discovery shaft is 26 ft. deep, and from three to seven ft. in width.

An excellent vein of fire clay, seven ft. in width, has been discovered near the Alta California lead, Colorado Dist., Jefferson county. It has been pronounced a genuine article after a practical test.

Post, May 18th: The largest nugget ever found in Montana was recently discovered by a man named Yager, on J. McEviloy & Co's claim in Fairweather Dist. Its weight is 15 lb. 3 ozs. It is of remarkable purity, containing no quartz, and very little base alloy; oblong in shape, with a shoulder like projection near one end. It is washed very smooth, and is believed to have come from a great distance above. It is the intention to have it forwarded to the States. Since "the find," the claim is held at high rates.

#### NEW MEXICO.

From the Albuquerque Press, May 4th: Mr. Cooley, one of the discoverers of the San Lizard Mountain mines, is exhibiting a specimen from that locality, the richest we ever saw. A piece, weighing less than two ozs., pounded up yielded 14 cts., or at the rate of \$2,000 per ton.

Manual Ysidri is running three arastras, which are yielding fully as well as the most sanguine expected.

#### ESMERALDA. NEVADA.

From the Territorial Enterprise, June 9th: The Wilson, Midas and Wheeler Cos. have taken out rock of an estimated value of \$40,000, and are still at work bringing it to the surface. Mr. Wilson is running a tunnel to strike the Wilson and Midas Cos., east of his. It is now in 455 ft., at which point wide spurs of pay ore are frequently met with, dipping towards the main ledge. Mr. Wilson is now in San Francisco. It is reported that he contemplates erecting a quartz mill near the mine, he being dissatisfied with the result of the crushing of his ore by the Pray and Blasdel mill.

Out of a tunnel 100 ft. long in the Midas mine, there has been taken fifty-two tons of ore, the bullion from which is valued at \$2,373.77.

A tunnel is being run on the Mastodon ledge, about 90 ft. below the shaft. At a distance of 100 ft., a fine vein of rich ore has been struck, but it is not supposed to be the main lead. One ton and 50 lbs. of the ore worked at the Ogden mill, yielded \$102 per ton gold, exclusive of silver.

Union, June 8th: Quite a number of strangers have been examining these mines lately, with the object of imparting information to parties at Virginia City, with a view of purchasing. Within the last 10 days, 2,900 lbs. of bullion from the Cornucopia mine at Partwick, have been received at the assay office of J. W. Poor.

#### HUMBOLDT.

From the Trespass, June 7th: The principal locations in this district are the Montezuma, Canada and Evening Star. The Montezuma is the leading mine. The top of the lode has been worked to the depth of from 18 to 25 ft., with 24 ft. face for excavating. About 15 tons of ore are extracted daily. Two tons of ore yields 2,400 lbs. of bullion, or 60 per cent. metal. The cost of mining, smelting, etc., is \$60 per ton.

Unionville Register, June 8th: New discoveries are being constantly made in Golconda Dist. A prospector comes in at night with all pockets and a hat full of ore from a new vein; assay good; next day, extensions located; many people happy, etc.

Ore from the Vicksburg Dist. is looking very fine, being rich in both silver and copper.

The Rochester Co. have completed their pumping and hoisting works. In a few hours the mine was freed of water, and, although a stream sufficient to run a 20-stamp mill flowed in constantly, no trouble was experienced in keeping it clear.

The Etna mill is running on ore from the Chloride ledge. Torrey has his furnaces ready to start up. He has several hundred tons of ore on the ground.

Montezuma Smelting Works shipped last week 1,400 ozs. fine bullion; also 10 tons crude bullion, and this week, so far, 12 tons. Machinery for a 15-stamp mill is on the way from California for the Essex Co., to be erected at Dun Glen. The Co. is working a full set of bands, and has out a large amount of fine ore awaiting the erection of the mill.

A bar of bullion has produced from 5,483 lbs. of ore from the Fisherman ledge, which is of the value of \$1,060.52. The ore was reduced at the Parrott mill, at Big creek, without roasting, and the bullion is .962 fine. The average assay of the pulp was \$386.84 per ton, of which the mill guaranteed 83 per cent.

H. W. Sayles has arrived from the copper district, in Humboldt river, with a lot of copper bullion, produced by roasting the ore on a common log fire.

#### PAHRANAGAT.

From the Rocky Mountain News, May 22d: These mines produce a rich silver ore, averaging \$260 per ton. The ore is not found in lodes, as in other mineral regions, but in a sort of "blow out" about three by five miles in area. The nearest water is some 12 miles, and the nearest timber of any value is 40 miles distant. One 5-stamp mill is the only work running. It crushes dry ores and amalgamates.

Reveille, June 8th: The New York Co. are making arrangements to erect a 10-stamp mill. The Alameda Co. has the machinery for its mill on the ground.

Mr. Stark, who visited Springer Hill, where a party of miners was working a ledge called Herman the Great, which was opened to the depth of 15 or 20 ft., says the ledge is 40 ft. wide, and inclosed between smooth walls, and that the ore is generally regarded as superior to any yet developed in the district. Several ledges in Irish Hill also, were developing excellent ore, and the prospects of the district looked brighter than ever.

#### REESSE RIVER.

From the Reveille, June 3d: The ledge discovered and located by Evans and Tennant lately, is proving rich. Several tons of ore which have been taken out, are estimated to yield from \$700 to \$800 per ton. The discoverers named the ledge the Adriatic; the lead is four ft. wide. The Rutland mill after lying idle for a while, has again started up with a good supply of quartz.

The Fisherman ledge of the Bullion Co. is the most fully developed in the district, and has been opened to a depth of about 50 ft., disclosing a vein of an average thickness of five ft. loaded with ore of extraordinary richness. It is reported that another mill of good power and capacity will be erected by the Co. in a few months.

About seven tons of Fortuna ore were reduced lately, the pulp of which was assayed by Boalt & Stetefeldt, with the following result: First-class ore, \$545.83; second-class ore, \$244.88 per ton.

June 4th: In Washington Dist., large, strong veins of silver-bearing mineral, which prospect well and show every indication of permanence, may be had at merely nominal terms. The Utica and Herkimer Co. have begun work on their mines, preparatory to the erection of reduction works. They have apparently fine property, which development may render remunerative. I am informed that an Eastern company will commence work in a short time upon the Prairie du Chien and other mines situated in Smith's Cañon.

A specimen of ore has been taken from the Fortuna mine seven in. wide, and the precise width of the vein.

June 6th: Samples of exceedingly rich gold and silver-bearing quartz continue to be brought to this city almost daily from Pine Grove, Washington Dist., Silver Bend and other mining localities in that direction.

The superintendent of the Mont Blanc mine, American Flat, has ordered hoisting machinery for the claim of that company in San Francisco, and expects to erect the same and work the mine in a scientific manner.

Territorial Enterprise, June 7th: The pay streak in the Highbridge, which was two ft. wide on the surface, has increased to 15 ft., and appears to be growing wider and richer. Excellent claims have been found about eight miles from Belmont, which are being vigorously prospected by parties from this city.

Reveille, June 6th: The Gilligan ledge, in Egan Cañon, appears to be the only one of the late discoveries that has been developed to advantage. It is one of the few mines in the State which has paid its own expenses from the first crushing of the ores. The ledge has been opened to a depth of 350 ft. The ore is argentiferous galena. The vein is 8 ft. wide, and produces, by the ordinary process, at the rate of \$345 per ton for 50 tons. The average yield of the ore exceeds \$100 per ton. The large mill which was bought by the Steptoe Co. and transported to Salt Lake City will be erected at Egan Cañon this summer.

A ton of ore taken from the Young America and Vestal ledges, Danville Dist., has a very peculiar look. It was obtained in the limestone, and assays very high.

The mill of the Centenary Co., Newark Dist., is being rapidly pushed to completion. It will not be furnished with roasting furnaces, as it is the opinion of the company that the ores of the district may be worked without the expensive aid of fire.

It is estimated that 300 tons of good milling ore has been extracted from the Chihuahua and Lincoln ledges. The vein of the Chihuahua is five ft. wide.

From 8,385 lbs. of second-class Kaleseed ore a silver bar, valued at \$723.58, was extracted.

The Buol North Star is now quite three

ft. thick, and the ore has diminished in quality. The last lot of ore sent to the mill averages \$326 per ton.

#### WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Gold Hill News, June 8th: The new hoisting and pumping machinery of the Crown Point mine, when completed, will cost \$60,000, and will enable the company to work to a depth of 1,500 ft.

From 75 tons of ore from the Overman, two bars were extracted, which, assayed by Ruhling & Co., yielded an aggregate value of \$3,312—being only a partial clean-up of the bulk from that lot of ore.

The new engines for the Yellow Jacket are on the road.

The frame of the new Empire-Imperial works is ready to raise, and will be put up as soon as the foundation is completed.

Trespass, June 7th: It is estimated that within a year more than 50,000 ft. of sluices have been constructed in Gold Cañon, and that the annual value of gold and silver saved is at least \$1,000,000. Through Gold Cañon to the Yellow Jacket mine, every mill and arastra is busily at work.

A winze sunk on the north end of the body of ore of the Savage mine, next to the Hale & Norcross, has attained the depth of 110 ft. in splendid ore.

Enterprise, June 8th: The Overman Co. have found a narrow streak of fine ore that will mill at least \$50. This streak appears to be increasing in width, and has a permanent look. In another part of the mine, about the 400-foot level, they have in sight from 7,000 to 8,000 tons of ore; that will make \$25 per ton.

The old hoisting works of the Sierra Nevada Co. is being moved down to the new shaft.

Trespass, June 7th: Hundreds of thousands of tons of ore are lying in the dump piles of mines on the Comstock lode that will pay a large profit if reduced by water power instead of steam. From Cedar Hill to American Flat there can be extracted 2,000 lbs. of surface rock on croppings that will pay \$12 per ton.

Enterprise, June 8th: There was shipped during the past week from the office of Wells, Fargo & Co., 12,914 lbs. of bullion, valued at \$314,448.59.

#### OREGON.

The Cañon City correspondent of the Dalles Mountaineer, May 6th, says that some soldiers have found rich prospects somewhere within 20 or 30 miles of Dixie Creek, John Day country.

The Salem Unionist says that new mines have been discovered near the base of the Cascade mountains, on Crooked river. The mines are said to be a few miles from the Lebanon wagon road over the mountains. A nugget, valued at \$50, is reported.

The Jacksonville Press says that Cohn's quartz mill on Illinois river, Josephine Co., has been completed, and has gone to work. We may expect some startling reports from this quarter soon.

The Ensign says that there is a mountain of cinnabar near Cañonville, Southern Oregon. Several pieces have lately been taken from it, heavy and full of quicksilver.

#### UTAH.

From the Vedette, May 28th: In this vicinity a number of finely developed ledges have been discovered, and about a dozen tested. The average assay is \$125 per ton, silver; as much as \$26 gold is found. Work will be commenced on the North Star lode about the 15th of June. There is already erected one Scotch hearth, one stack furnace, one cupel furnace, a water wheel, fan, and several dwelling houses. It is the intention to erect four more stack furnaces, of three tons capacity each, and one cupel furnace in addition to the one already up. The ore yields 80 per cent. slack.

A specimen of copper ore taken from a ledge 12 miles northeast of Salt Lake, bears evidence of containing considerable silver in addition to copper.

There are rumors of a discovery of good gold diggings, 230 miles southeast of Salt Lake.

HOW TO CLEANSE CISTERNS.—Many persons are often greatly annoyed by foul cisterns, a ready way to cleanse which they would gladly learn. The following is recommended as both cheap and simple: After frequent cleaning and other experiments, all to no permanent utility, I was advised to put, say two pounds caustic soda in the water, and it purified it in a few hours. Since then, when I tried what is called concentrated lye, I had quite a good result. One or both of these articles can be obtained at any druggists.

#### "Millions of Dollars Lost" in Mining

Frequent assertions are made about the loss of "millions of dollars" in mining operations; one of the latest may be found in the American Exchange and Review, a "Miscellany of Useful Knowledge," for April, 1867. That journal says: "In Colorado, the grave of so much Eastern capital, where ten millions of dollars have been spent upon her gold impregnated ores, to solve the riddle, how to roast and how to amalgamate," etc.

Notwithstanding this enormous loss, we are pleased to find that "Hope is not yet dead," and that "the spirit of investigation is still at work."

Now, as ten millions of dollars, even in greenbacks, is a large sum, we should like to know how they managed to lose so much. The veins are represented as being from six inches to nine feet wide; and Governor Evans claims that in most of the lodes now worked, the average yield is \$36 per ton, which will be three-fold greater when the reduction of ore reaches the perfection of a fire assay. The present yield of \$36 ought to pay the expenses, at least. It is probable, however, that the writer refers to the loss of that amount, as exhibited on the face of the certificates of stock, in the various companies formed, which, from their failure to declare dividends, possess no market value. If so, the loss of "millions" is imaginary. In California, joint stock companies, numbering thousands, were incorporated with capital stocks, amounting in the aggregate to ten times ten millions of dollars; but where was the capital—where are the companies of ninety-nine out of every hundred? Some levied and collected assessments, until they could collect no more. Some of the money thus raised was expended for the legitimate object of mining; but much more of it was expended in litigation and the pay of officials, office rent, etc. Some of the stocks possessed value for a time, at the stock boards, and upon the stock exchange there were eager buyers and eager sellers. Much money changed hands; some were enriched, others were impoverished—one man's loss was another man's gain. The amount actually lost in the legitimate operation of mining was trifling, compared to the apparent loss upon Montgomery street. During this excitement, men without knowledge or experience in mining, became suddenly the oracles of the crowds on every corner, where they talked learnedly about dips, angles, horses, chimneys, chlorides, oxides, sulphides, the rock of the country, etc., etc., to the wondering admiration of their hearers. No man could walk a square along any street in San Francisco without hearing the sound of "feet;" but alas! that sound has died away. It is to be regretted that, while such men can gain the ear of capital, the honest miner—no matter how good a mine he may have to offer—must look in vain for a customer.

M.

A VALUABLE DISCOVERY.—It has recently been discovered that the fiber of the palm of the Indian Archipelago is almost indestructible under water. An anchor, which was fished up after sixty years of submersion, had a small piece of native rope made of this fiber attached to it, which was as strong as when placed there. A cigar manufacturer of Java, has used a lot of it as a filter for three or four months in the year, for the last twenty-five years, without observing any appearance of decay in the material. These evidences of the indestructible nature of this fiber are attracting considerable attention to it as an article of commercial value, which, it is thought, may be introduced into more general and extended use. It is about to be applied as a covering for a submarine cable, for which purpose it is expected to prove of great value.

THE TOBACCO YIELD.—Last year there were 350,501,500 pounds of tobacco produced in the United States, a falling off of 104,000,000 as compared with the crop of 1861.

## Agent Wanted!

A FIRST CLASS CANVASSING AGENT (none other need apply) can secure permanent employment and make \$30 per week and expenses, or better, by applying to DEWEY &amp; CO., Mining and Scientific Press Office, 505 Clay street.

## San Francisco:

Saturday Morning, June 15, 1867.

## Notices to Correspondents.

DEMOCRAT.—"By nature, all men are equal," is a sentiment that was publicly enunciated at a much earlier date than the Declaration of American Independence. The sentence, in the exact order in which it appears above, is first historically recorded as having been delivered during Wat Tyler's rebellion in England, on June 10th, in the year 1381. Its history is so curious and interesting that it merits fuller particulars. At Maidston, Wat Tyler was appointed the leader of the Commons (commonality) of Kent. At the same place they enlisted the service also of an itinerant, but powerful, preacher, named John Bale. On reaching Blackheath, which is in close proximity to London, the tumultuous multitude assembled is stated to have numbered one hundred thousand, to which Bale was unanimously appointed preacher. On the occasion of his first sermon (or rather harangue) he took for his text a doggerel rhyme, which is not unfrequently quoted, viz.:

"When Adam delved and Eve spun,  
Who was then the gentleman?"

The major part of his harangue consisted in showing that any other principle than that enunciated in the words which form the heading to this notice, is contrary to the views of the Creator, and concluded by declaring that when all distinctions of rank are abolished, all would be free, because all would be of the same nobility and of equal authority. This little bit of history is curious by way of illustrating how very slowly freedom and liberal ideas progress, as nearly six centuries have elapsed since the noble sentence adopted in our Declaration of Independence was first historically recorded, while the feeling for which it was the expression must have pervaded many minds long antecedent to its publication. The harangue under notice is further remarkable as having not improbably suggested to Byron the remarkable words:

"Hereditary bondage! know ye not  
Who would be free themselves must strike the blow!"

For, in his closing words, the observation was made "that God now offered them the means of recovering their liberty, and that if, in future, they continued slaves, the blame would rest with themselves."

LINGUISTIC STUDENT, Stockton.—What may be termed double dictionaries, now so commonly known, such as English and French, English and German, etc., and their inverse orders, however the fact may be surprising to many, is only of a comparatively recent origin. Many centuries rolled over the heads of both teachers and pupils before what must appear to the present generation so obvious an improvement was adopted. The Romans studied Greek through all the classical ages without any assistance derivable from a Greek and Latin Dictionary. Such a work, in fact, did not come into existence until both languages for the ordinary intercourse of life had ceased to exist, or become, as they are commonly called, *dead*. The earliest work of the character alluded to was the production of Crastone, an Italian monk of the fifteenth century, who lived at the time of the fall of Constantinople.

AN ADMIRER OF GEMS.—The earliest notice of any diamond having been discovered in California, is to be found in volume eight of Silliman's *Journal*, page 294. According to that communication it was of a straw yellow color, of the size of a pea, and possessed curved faces.

## The Prize Essay.

We presume that no apology is necessary for the continuation of our remarks under the above head. The variety of subjects embraced, and the vastness of the interests at stake, both present and prospective, the advancement of which is contemplated in the offering of the Mechanics' Institute prize, is patent to every intelligent Californian.

Foremost amongst the items to which we presume the attention of competitors will be chiefly drawn, is the agricultural part of the subject, embracing all matters relating to climate and soil, with a brief glance at such geological accompaniments as may usually be found in connection with great breadths of soil, and their adaptability or unfitness to the growth of cereal, forage and pasture grasses, together with where and how these may most profitably be cultivated; the different kinds of stock, individually or mixed, which can most profitably be raised and fed under their relatively varied conditions and markets, particularizing, chiefly, horned cattle, sheep, horses, hogs, etc., and the profits or otherwise which may fairly be anticipated as the result of such undertakings. Viniculture and the manufacture of wines and brandies will form important items under this general but leading subdivision; nor ought the subject of oleaginous seed crops, such, for instance, as flax, hemp and the cruciform plants, and the more arborescent castor and olive tree, to be neglected. Fruit-yielding trees and plants, such as the fig, orange, apple, pear, lemon, almond, peach, and other varieties of this last named genus, will necessarily occur to any one not wholly overlooking the fact that amongst the agremens of life our soil and climate, under proper conditions, produce, in quantity and quality, unexcelled, all the minor berries, as currants, raspberries, strawberries, gooseberries, etc., not forgetting the enormous pumpkin, squash, etc., obtainable either for the nutriment of cattle or household use. Nor must he overlooked the weighty and excellent root crops produced, especially beets and carrots, and the probability of insuring large and nutritious crops of different species of the *brassica* tribe, according to their adaptability for particular seasons and soils.

Many of these matters may be pertinently dwelt upon when treating upon our principal dairy products—milk, butter and cheese—allied also with special manufactures, such as sugar, etc. The advisability or otherwise of growing crops for textile purposes, alone or conjointly, for their seeds, might obtain a division, such as flax, hemp, cotton, or any substitute therefore. The subject of wool need not specially be here referred to, as it will undoubtedly occupy a prominent place, not only as respects the inquiry relating to the manufacturing department, but also largely, so far as relates to the economical management of sheep, according to localities.

The branch devoted to the consideration of the opportunities afforded in connection with our mining capabilities, especially those associated with the metals—gold, silver, mercury, lead and copper, and their most advantageous reduction, will necessarily embrace a wide field and ample scope for an excellent treatise. It ought to dwell equally upon our *disadvantages as advantages*, and ingeniously explain any errors committed by common practice, by which mining has been less successful than it should have been; and at the same time should lucidly describe any better mode of procedure followed elsewhere which could advantageously be adopted, notwithstanding our different positions.

The value of our coal and petroleum deposits, as well as many other matters connected with the mineral kingdom, ought not to be overlooked, both as respects the probability of present supply, and also as

regards their prospective importance hereafter. A similar observation may be made with regard to our timbers, and other products relating to agriculture. Lastly, but by no means of least importance, the economical application of our winter floods to purposes of irrigation and manufactures, ought not to be forgotten.

Having named many of the chief heads which should be treated upon, we shall proceed to describe what we conceive ought to be the leading principle which should form a most prominent feature in any essay for which the prize may be awarded. In doing so we may possibly differ very much from the opinion so far crudely formed by the public, with whom the general impression appears to be that an essay, such as it is attempted to obtain, would be mainly useful as inducing emigration. Whilst willing to admit its value in such direction, we are by no means inclined to deem it more primarily important than what may and ought to follow, by the diffusion of sound and useful information amongst our own population. We believe that a double end may be attained, in laying before our own people a succinct, yet, at the same time, an elaborate treatise, containing the principle or *rationale*, which ought to guide our agricultural, mining and mechanical energies; pointing out where and why such would be most available or unproductive, and where most required. A well written work of this kind would not only be useful to the inhabitants of our own coast, but would possess, intrinsically, *per se*, an interest to the citizen of the Eastern States, whether he be a resident of Missouri or New York, or a dweller in Maine or Louisiana. Nay, further; as such a synoptical joint agricultural and metallurgical treatise has never yet appeared, in any form or language, a well condensed work of the character proposed, would be as eagerly read, in consequence of its cosmopolitan character, by the native of the British Isles; or, if translated, be esteemed equally valuable by the hardy Norseman, on his pine-clad hills, as by the inhabitant of sunny Italy, who may be engaged either in the rearing of or treating the produce of the silkworm, the preparation of olive oil for table use, or the delicious *Lachrymæ Christi*.

The reason why cereals, of different varieties, flourish better in one clime or character of soil, than another, ought to be explained—a remark which holds good with other plants also, whether it regards the olive, any species of grape, or any variety of wine. We have climes and soils verging from Alpine rockiness and cold, to the semi-tropical conditions which surround the living occupants of the Celtiberian peninsula with its vine, olive, mulberry, orange and lemon groves, and its luxuriant *vegas*, all of which latter might be paralleled in this State by the exercise of skill, capital and forethought.

Since the above was put in type, the Institute has made its official announcement of the prize offer, with the names of the gentlemen selected to constitute the Committee of Judges, the time allowed for competitors to prepare their articles, etc. This announcement will be found in our advertising columns. Of the Committee, the *Bulletin* of this city says:

It is composed of gentlemen of ability, public spirit and integrity of purpose, well known in California. They have been chosen with a view to their practical knowledge of the resources of the State, and their high character is a guarantee that parties competing for the premium will have their essays treated in a fair and impartial manner by competent judges. Gov. Low, who heads the list, has been a resident of California since 1849, and is well acquainted with the resources and wants of the State. Gen. Halleck arrived prior to the discovery of gold at Coloma (1848), and has a practical experience of great value. Prof. Whitney is well known to the public through his labors as chief officer of the State Geological survey. Prof. Ewer has an experience and knowledge of the mineral resources

of the State and of the opening for successful industrial labor that will make him very valuable as a member of the Committee. James Otis is a member of the firm of Macondray & Co., of this city, and has a thorough knowledge of our commercial wants and the markets that are accessible for both our products and manufactures. B. N. Bugbey is the noted viniculturalist and wine-grower, whose efforts in the introduction and propagation of the most valuable foreign wine grapes has been of great benefit to our wine interest. W. Gouverneur Morris is one of the largest fruit and grain-growers in Napa county, and is reported to be well fitted to judge in all matters relating to those interests. As a whole, the Committee is a most competent one for the purpose named, and we look for valuable results from their labors.

NEW STEAM STAMP MILLS.—J. E. Clayton, M. E., who recently arrived from the East, has shipped from New York three two-stamp steam mills, similar to that described by us a few weeks since as having been put in operation at the Pacific Foundry. The chief novelty in the present mills is the existence of a steam connection between the lower partition of the two steam cylinders, by which the steam, when the blow is given, instead of being compressed, so as to lift the stamp by its elasticity (thus wasting a large amount of power), is made to pass into the adjoining cylinder and raise the other stamp, and *vice versa*. The improvement must be obvious.

Mr. Clayton, during his absence, has also devised several other contrivances, which are thought to be important in economizing labor and power in the process of stamping, one of which is a conveniently arranged screen, by which a universal discharge is effected on all sides of the battery at the same time. But perhaps the most important idea is the arrangement of a steam jet to take the place of the suction blower in dry crushing. The steam is not only a convenient and economical mode of exhausting the battery of the quartz as fast as it is pulverized sufficiently fine, but it also moistens it, so that there is no chance of loss by its being carried away with the escape of the exhaust blast as it leaves the dust or ore chamber. We presume that Mr. C. will take an early opportunity to give our miners a practical test of his alleged improvements. He has now gone to the Silver Peak District, Nevada, to take charge of the development of a large mining property there, which has recently passed into the hands of a New York company.

LEVY'S FIRE ANNIHILATORS.—We have just seen at 304 Montgomery street, three of Levy Brothers' portable self-acting fire-extinguishers, which are now in use in the principal Eastern cities, and which reached here on the last steamer. The machine is so light that it is strapped upon a man's shoulders while being operated. Allusion has already been made to it in our columns. We are informed by the agent, Mr. E. L. Levy, that there will be a public exhibition of the same some time next week, when all interested will have an opportunity of witnessing the mode of operating, and can decide for themselves as to its merits.

RETURNED.—Mr. Myers, who has the patent right for this coast for Leffel's American double turbine water wheel, arrived from the East by the last steamer. He is accompanied by several neighbors, who come for permanent settlement. We are informed that three manufactories in the Eastern States are kept busy in supplying the demand for the above named wheels. Mr. Myers has on the way for Oregon all the apparatus specially required for their manufacture. The Oregon Iron Smelting Works will soon be in operation, when entirely home water wheels will be issued.

REMOVAL.—The office of the Pacific Chemical Works (Messrs. Falkenau & Hanks) has been removed from its late location on Washington, to No. 623 Montgomery street, opposite Montgomery Block.

**A CHANCE FOR CAPITALISTS.**—From a private letter from Gen. C. A. Reed, Adjutant General of Oregon, dated Salem, June 5th, we extract the following:

"I wish I was able to give you some glowing accounts from the Santiam mines, and who knows but what I may yet. I have not the least doubt but that good mines are there, and that they will be found, and made available. McDonald has made one trip there this spring, and reports everything in good condition. Our quartz mill is as clear of rust or damage as it was the day we left it. The sawmill is in readiness to lay open those fine white pines which abound in that region, and the railways stand ready to dump the quartz rock at the mill. I wonder if there is not some of your Californians competent to test these mines. Our leads are fine in appearance, varying from eight to twelve feet in width, containing an abundance of mineral of some kind. The man who heretofore superintended the working of the ore did not understand the operation sufficiently to save his amalgam.

You will bear in mind that these mines are only one day's journey from here (Salem) forty miles of which is through a level country. The mill is surrounded with an abundance of timber, and can be worked at a very low figure. We have been to a great outlay, and would be glad to get some one interested with us that understands the business."

It seems after all that it takes a Californian to develop mines, and we doubt not but that our neighbor, Oregon, would be a good place for some of our competent miners to visit. It is known to abound in minerals, especially the Cascade range, yet it has never had parties sufficiently versed in mineralogy, to examine and test its extent and value. Oregonians are, as a general thing, liberal to Californians, and in this case would be apt to be doubly so.

## MECHANICS' INSTITUTE.

### Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.

The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1887, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.

Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity.

The Committee of Judges have the right to reject all Essays in which they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear, legible writing, so as to admit of easy reading.

The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges: Hon. Fred F. Low, Maj. Gen. H. W. Halleck, U. S. A., Prof. J. D. Whitney, Prof. W. B. Ewer, James Otis, E. N. Bugboy, Wm. Governor Morris, By order of the Board of Directors.

D. E. HAYES, Secretary.  
San Francisco, June 12, 1887. 24v14-2m

Jacob Szew, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (also 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cibacit Photographs," which he is taking to perfection. 19v14tf

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by D. H. WOODS, No. 28 Third street. 19v14tf

## NORTH AMERICA

### Life Insurance Company.

Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!

J. A. EATON & CO.,

Managers Pacific Branch, 302 Montgomery st. 20v14n9p SAN FRANCISCO.

## \$85 FOR HUNTER'S IMPROVED CONCENTRATOR.

Fig. 1.

### HUNTER'S CONCENTRATOR.

The patentee is prepared to sell his Concentrator at the above price, and guarantees, when the machine is run according to directions, to give 20 per cent. better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra.

### FOR \$50.

**HUNTER'S EUREKA AMALGAMATOR.** For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Orass Valley. The cost of the Irons for the machine, without the Iron-box, is about \$100. The box will answer of wood.

By reference to the MINING AND SCIENTIFIC PRESS of May 25, a full description of the above Machines may be found. For particulars, send for Circulars, or address

ANDREW HUNTER,

Union Foundry, San Francisco.

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on Application, in person or by letter, to 5v14-ty AUSTIN A. WELLS, Agent.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-ty

### Perry Davis' Vegetable Pain Killer.

Importance of having Davis' Pain Killer always on hand. Wonderful cure of the Rev. D. L. Brayton, Missionary in India, who was stung by a scorpion. Extract from his letter, published in the Baptist Missionary Magazine:

"For the first time since I have been in India, I have been stung by a scorpion. I went out this morning to my exercises, as usual, at early dawn, and having occasion to use an old box, on taking off the cover I put my hand on a scorpion, which immediately resented the insult by thrusting its sting into the palm of my hand. The instantaneous and severe pain which darted through the system is quite incredible! What an awfully virulent poison their sting must contain! I drew out my bottle of Davis' Pain Killer, and found it to be true to its name; after a moment's relief, I saturated a small piece of sponge, bound it on my hand, and went about my exercises, feeling no more particular inconvenience. Sold by all Medicine Dealers everywhere. 22v14-3p

### MAURICE DORE & CO.,

Real Estate, Stock and General Auctioneers, Office and Salesroom, 327 Montgomery st.

H. A. COBB, Auctioneer.

### Guardian's Sale of Real Estate.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE of the order of the Probate Court of the City and County of San Francisco, in the State of California, made on the 25th day of January, A. D. 1887, in the matter of the guardianship of the person and estate of Bertha Louisa Washburn, a minor, the undersigned, Guardian of the person and estate of said minor, will sell at public auction, to the highest bidder, for cash, in separate parcels, and subject to confirmation by said Probate Court, on SATURDAY, the 6th day of July, A. D. 1887, at 12 o'clock M., at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, in said City and County, all the right, title, interest and estate of said minor in and to each of those lots, pieces or parcels of land situated, lying and being in the said city and county, and described as follows, viz:

PARCEL No. 1.—Lot on the west side of Stockton street, commencing 95 3/4 feet north of Jackson street; thence north 20 feet 7 1/2 inches, by a depth of 93 1/2 feet.

PARCEL No. 2.—Lot on the east side of Stockton street, commencing 87 1/2 feet north from N. E. corner of Stockton and Greenwich streets; thence north 50 feet, by a depth of 127 1/2 feet.

PARCEL No. 3.—Lot on S. W. corner of Sacramento and Gustavus streets, 60 feet front on Sacramento street by 77 1/2 feet deep on Gustavus street.

Terms and conditions of sale—Cash to be paid on the day of sale.

E. H. WASHBURN, Guardian of the person and estate of said minor. San Francisco, June 11th, 1887. 24v14-3w

### FAIRBANK'S PATENT

U. S. STANDARD

COUNTER AND

### PLATFORM SCALES!

Also, large Scales for weighing loaded wagons of Ore, Hay, etc., from 5,000 to 40,000 pounds capacity. Manufacturers' Branch House, FAIRBANKS & HUTCHINSON, 120 California street, San Francisco. 24v14-cw6m

### RADICAL CURE

—OF—

### RUPTURE!

Treatment of all Deformities of the Body, by DR. A. FOLLEAU. Every kind of Apparatus, Trusses, Orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 24v14-11pfr

### DR. A. FOLLEAU

Has his studies and manufactures in the same building. Every kind of Apparatus, Trusses, Orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 24v14-11pfr

### THE CENTRAL PARK OF THE PACIFIC.

Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, —AND— ZOOLOGICAL GARDENS.

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.

The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic. To all departments new attractions are being constantly added.

These Gardens are accessible by the Howard, Folsom and Market street Cars. Entrances on Mission and Valencia streets, between Thirteenth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 Cents. Children, under 12 years, half price. 24v14-c

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O. ... County, ... State, to Mr. ... at ... P. O. ... County, ... State. ... 1887."

**Builders' Insurance Company—** OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street. FIRE AND MARINE INSURANCE. 10v14-9pqr

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**J. N. ECKEL, M. D.,** Homoeopathic Physician 226 Post Street, San Francisco. 24v14-yr

### REMOVAL.

### PACIFIC CHEMICAL WORKS.

FALKENAU & HANKS HAVE REMOVED THEIR OFFICE to 623 Montgomery street, opposite Montgomery Block, where they will receive orders for Chemicals of all descriptions, and for Assays and Analyses of Ores, Minerals, Metallurgical Products, Mineral Waters, Commercial Articles, etc. Laboratory, corner of Center and Folsom streets, Mission. 24v14-4w

### Piles! Piles! Piles!

NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

### WOOD'S SUB-POSITORY.

It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. ORISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny. C. WOOD, Proprietor, No. 63 Tebama street, between First and Second. 24v14-3m

### LINSEED OIL.

### The Pacific Linseed Oil & Lead Works

Are now prepared to furnish dealers and consumers

### Pure Linseed Oil.

Raw or Baked, at the Lowest Market Rates. We call especial attention to the quality of our Oil, believing it to be superior to any imported Oil offered in this market. Orders from the country will have prompt attention.

Address, Pacific Linseed Oil and Lead Works, Care of L. B. BENCHLEY & CO., 19v14-3m9p San Francisco.

### PACIFIC

### Rolling Mill and Forge Co., SAN FRANCISCO, CAL.

Established for the Manufacture of

### RAILROAD AND OTHER IRON

### Every Variety of Shafting,

Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames.

### HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v14-3m9p

### A. S. Hallidie & Co.,

MANUFACTURERS OF

### FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach SAN FRANCISCO. NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is applied and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope, effecting a immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing the safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ship's Rigging, Derrick Gears, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Rope—1/2 to 1/4 inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Cr. 1 1/2" pr. 100 ft.	Cr. 1 1/2" pr. 100 ft.	Cr. 1 1/2" pr. 100 ft.	Cr. 1 1/2" pr. 100 ft.	Cr. 1 1/2" pr. 100 ft.
2 1/2	1 1/2	5	100	250
2 1/2	1 1/2	5	100	250
3 1/2	2 1/2	8	150	375
3 1/2	2 1/2	8	150	375

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 24v13-6m9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, File Drivers, Bark and Mark Mills, and all kinds of Castings.

**ENGINES.** Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use. W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.** The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Frater's concentrators, Wabbe's pans, Beers' pan, German Barrels, Astra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

6v12-ly

NICKEL PENNY.—Has anybody a nickel  
penny of 1858? The Washington Star says  
there is an active search for them, and that  
they are considered worth twenty-five cents  
each, because they have been almost wholly  
withdrawn from circulation, and will be  
very valuable by-and-by in completing col-  
lections. The penny in question will be  
remembered as bearing on one face the rep-  
resentation of a buzzard instead of an eagle.  
Exchange.

We have about a dozen of them. Who  
bids? By the way, the "buzzard" was on  
the issues of both 1858 and 1857.

TO DESTROY FLIES.—To one pint of milk  
add a quarter of a pound of raw sugar, and  
two ounces of ground pepper, simmer them  
together eight or ten minutes, and place it  
about in shallow dishes. The flies attack it  
greedily and are soon suffocated. By this  
method, kitchens, etc., may be kept clear of  
flies all summer without the danger attending  
poison.

CAVERN.—A cave has been found on the  
hills between here and Grass Valley, says  
the Napa Reporter. It was explored as far  
as a hundred feet, and contained several  
chambers from ten to twenty feet in height.  
The explorer was afraid to go any further  
in, on account of the nature of the interior.  
A party are going from Napa shortly, with  
a view of exploring it completely.

SOLIDIFIED GLYCERINE.—An English  
company are now manufacturing a toilet  
soap with which solidified glycerine is amal-  
gamated in equal proportions by weight.  
The result is a semi-transparent tablet,  
which lathers well and wears well, and de-  
serves a wide popularity.

BED BUGS, it is said, have a great aversion  
to salt. If the articles and places infested  
with bed bugs are washed with salt water,  
and the crevices in which the vermin hide  
are filled with it, they will give no more  
trouble.

An ancient tunnel was discovered, not  
long since, under a river in the interior of  
Peru, the work of the old Inca Indians, and  
a lasting proof of their civilization.

TOWNE & BACON,

Francisco for the last fourteen years, and owns the repu-  
tation of having built ONE HUNDRED AND SEVENTEEN  
STEAM ENGINES

Screw Propellers of all kinds, and Steam Boat Machinery  
generally, made to order, and warranted to give perfect  
satisfaction in every particular 25v12-3m

**COPPER MINES IN THE NORTH.**—It is said that the Indians from the Copper Mine river in the interior often bring nuggets of native copper into Kodiak and the settlements near the mouth of that river. Many large specimens of metallic copper and of copper ore have been taken to St. Petersburg.

**DUCTILITY OF GOLD.**—The beating of gold into the gossamer-like sheets of gold leaf, seems almost a miracle of ductility; but the film of gold which covers the fine lace of which the richest epaulettes and gold fringe are made, is only one-tenth the thickness of fine gold leaf!

THE Duke of Argyll recently expressed the opinion at an educational meeting in London, that the American system of common school education would in all probability be demanded by the people of England.

**B. F. HOWLAND,**  
**PHOTOGRAPHER,**  
Nos. 25 and 27 Third street, east side, near Market street,

gomery street, San Francisco. 12v13-1y

## A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into.

8v10 Cor. of Washington and Sansome streets.

## BLAKE'S PATENT QUARTZ CRUSHER.

## CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE &amp; TYLER, Agents for the Pacific Coast.

## Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Newly printed copies of advertisements, for serving individual notice to stockholders, printed at \$1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. Blank forms, for filing out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office.

**DEWEY & CO., Publishers,**  
605 Clay street, corner Sansome, San Francisco.

**Illegal Supplemental Advertising.**—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

## Professional Cards.

**SHERMAN DAY,**  
Mining Engineer,  
No. 114 Montgomery Block, San Francisco,  
Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines.  
22q\*

**CHAS. LIEBENAU,**  
Mining Engineer and Metallurgist,  
(Graduate of the Mining Academy, Freiberg, Germany.)  
Oro, Flint District, Owyhee Co., Idaho.  
REFERENCES.—George Horst, John W. Gashwiler, Blehn, Hume & Co., and J. M. McDonald, San Francisco; E. R. Purple, New York; William Bigler, Pean. 14v14-3m\*

Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.

From Hongkong their steamers run constantly to  
Swatow, Amoy, Foochow, Shanghai, and Yokohama.  
HONGKONG, 1867. 13v14tf

**ELECTROTYPING CUTS, ENGRAVINGS, ETC.**—Our Job Printing  
Office is abundantly supplied with elegant engravings, or-  
naments, and other embellishments to suit the various  
branches of industry in this State.

## Metallurgy.

**BOALT & STETEFELDT,**  
Metallurgists and Mining Engineers  
**AUSTIN, NEVADA.**  
Western Branch of ADELBERG & RAYMOND, No. 90  
Broadway, New York. 11v11

**G. W. MAYNARD.** **J. B. TIEMANN.**  
**MAYNARD & TIEMANN,**  
Mining Engineers and Metallurgists,  
240 Pearl street, New York,  
—AND—  
**CENTRAL CITY, COLORADO.**  
19v12-1y

**EUROPEAN**  
**METALLURGICAL WORKS,**  
—AND—  
**Practical Mining School,**  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended. Sulphuretted, pyritic, and the (so-called) "rebel-  
lous ores," are having special attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. P. KIMBALL, J. R. MURPHY.  
10v10

**MOSHEIMER'S**  
**Metallurgic Works**  
And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

**CONSULTATION OFFICE:**  
328 Montgomery street, San Francisco.  
**J. MOSHEIMER,**  
Engineer and Metallurgist.

**J. A. BAUER,**  
**Chemical Laboratory,**  
**AND DRUG STORE,**  
644 Washington Street. (Established 1849.)  
SAN FRANCISCO.

Careful Analyses made of  
**Ores, Minerals, Waters, Oils, Liquors,**  
**Wines, Products of Art, etc.**

## Pharmaceutical Preparations Made to Order.

Opinions given on Chemical Questions and Geology.  
Particular attention paid to Analyses of all kinds, n  
cases where legal questions are involved.  
Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin  
Chloride, Sodium Amalgam, Sulphate of Copper, etc., for  
sale. 12v14-6m

## Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following  
blanks used in securing patents for lands under the  
National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.

II. Diagram, Description of Diagram and Bound-  
aries, and Notice.

III. Register's Order for Publication—with No-  
tice.

IV. Deposition that Notice has been Posted.

V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per doz-  
en; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instruc-  
tions of the General Land Commissioner, post  
paid, 25 cts. Address **DEWEY & CO.,**

Mining and Scientific Press, San Francisco.

## Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS  
has been signalized with remarkable success during the  
past two years. The importance to the inventive genius of  
this coast of a thorough and reliable agency for the solicita-  
tion of LETTERS PATENT from the United States and foreign  
Governments cannot be over-rated, and the Proprietors of the  
Press, feeling the responsibility which rests upon them, and  
the reward which must follow the faithful performance of  
their trusts, will take care to afford inventors every advan-  
tage to be secured to them through a competent and re-  
sponsible agency upon this coast.

Postage.—The postage on the MINING AND SCIENTIFIC  
PRESS to any portion of the United States is twenty cents per  
annum, or five cents per quarter, payable in advance at the  
Post Office delivering the paper. Postage free in the city  
and country. Foreign postage (with few exceptions) two  
cents per copy, prepaid. To Bremen and the German  
States (marked via Bremen and Hamburg line), three cents  
per copy, prepaid. Single copies to any address in the United  
States, two cents.

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

## New Mining Advertisements.

**Dardanelles Copper Mining Company.** Location: Low Divide District, Del Norte County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of June, 1867, an assessment of eight cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary at Crescent City, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the third day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. CURTIS, Secretary.  
Office, at Woodbury & Marboller's, Crescent City, California. jels

**Gold Hill Tunneling Gold and Silver Mining Company.** Location: Gold Hill Mining District, County of Storey, State of Nevada. Notice.—The Fourth Annual Meeting of the stockholders of the above named Company, will be held at their office, 415 Montgomery street, San Francisco, Cal., on SATURDAY, the twentieth (20th) day of July, 1867, at 3 1/2 o'clock, P. M., for the purpose of electing Trustees to serve for the ensuing year, and such other business as may properly come before it.

R. WEECER, Secretary.  
San Francisco, June 15, 1867. jels 5v\*

**Hope Gravel Mining Company.** Location of Works and Property: Orass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of June, 1867, an assessment (No. 15) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at No. 529 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

And in accordance with law, and an order of the Board of Trustees, made on the said twentieth day of April, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 53 Exchange Building, northwest corner of Washington and Montgomery streets, San Francisco, Cal., on the nineteenth day of June, 1867, at the hour of one o'clock P. M. of said day, to the highest bidder, for cash, in U. S. gold coin, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN M. BURNETT, Secretary.  
Office, No. 53 Exchange Building, northwest corner of Washington and Montgomery streets, San Francisco, California. jel

**Hause Copper Mining Company.** Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of May, 1867, an assessment of twenty-five cents (25c) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the Elina Iron Works, Fremont street, between California and Montgomery streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twentieth (20th) day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN HANCOCK, Secretary.  
Office, at the Elina Iron Works, Fremont street, between Howard and Folsom, San Francisco. Office hours: from 8 A. M. to 12 M. my25

**I. X. L. Gold and Silver Mining Company.** Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice.—There is delinquent, upon the following described stock, on account of assessment levied on the thirtieth day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
Jas. A. Blaisdell	237	2	15 00
H. C. Blaisdell	237	2	15 00
H. G. Blaisdell	232	1	15 00
John F. Davis	232	4	60 00
Wm. D. Davis	232	3 1/2	45 00
Wm. D. Davis	232	4	60 00
C. R. Callender	214	4	60 00
D. H. Callender	224	10	150 00
Ann Hogan	176	7	105 00
J. A. Johnson	238	5	75 00
Isiah Legro	212	5	75 00
Hart, C. A.	234	1	15 00
Geo. C. McAllister	214	4	60 00
Sam'l Michelson	187	1	15 00
Thos. Newcomb	181	5	75 00
Wm. N. Noyes	221	5	75 00
Chas. C. Phillips	63	5	75 00
Benjamin Starr	229	1	15 00
Mrs. Margaret Robie	226	5	75 00

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of April, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, at Nos. 418 and 420 Clay street, San Francisco, California, on Monday, the seventeenth day of June, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. B. STEVENS, Secretary.  
Office, 418 and 420 Clay street, San Francisco. jel

**Lyon Mill and Mining Company, Kelsey District.** El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of May, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 5 Government House, corner of Sansome and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.  
Office, No. 5 Government House, corner of Washington and Sansome streets. jels

**Lady Franklin Gold and Silver Mining Company.** Silver Mountain Mining District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of May, 1867, an assessment of thirty (30) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the tenth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. S. LUTY, Secretary.  
Office, 305 Montgomery street, Rooms 5 and 6, San Francisco, California. my4

**Monnt Davidson Gold and Silver Mining Company.** Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. PARLOW, Secretary.  
Office, 121 Sutter street, San Francisco, Cal. my25

**Nuestra Senora de Guadalupe Silver Mining Company.** Tayoltita, San Dimas District, Durango, Mexico.

The public is herewith cautioned against buying or negotiating the following described Certificates of Stock in said Company, to wit: Issued to H. Bruening, No. 96, 5 shares; to Wm. Gelmann, Nos. 105, 107 and 108, each 10 shares; and Nos. 109, 110, 111, 112, 113, each 5 shares; to Chas. Schumacher, No. 47, 5 shares; and No. 51, 15 shares; and to La Abra Silver Mining Company (New York) No. 155, 550 shares, as said Stock has been sold for delinquent assessment (No. 25) at public auction, on Wednesday, May 15th, 1867.

E. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco. my18

**Nuestra Senora de Guadalupe Silver Mining Company.** Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of May, 1867, an assessment (No. 27) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, or to the Treasurer, A. H. Melman, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the tenth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco. my25

**Office of the Providence Mining Company.** Notice.—The Annual Meeting of the stockholders of the above Company, for the purpose electing Trustees, and transacting other necessary business, will be held at the office of the Company, No. 5 Government House, San Francisco, on the TWENTIETH DAY OF JUNE, 1867, at 2 o'clock P. M., of that day.

F. T. FOLSOM, President.  
J. M. BURRIS, Secretary.  
San Francisco, May 27, 1867. jels

**Rattlesnake Gold and Silver Mining Company.** Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of May, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of June, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.  
Office, 318 California street, up-stairs, San Francisco. m25

**Santon Mining Company.** Location of Works: Drytown, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of May, 1867, an assessment of one hundred dollars per share was levied upon the capital stock of said Company, payable July 5th, 1867, in United States gold coin, to the Secretary, at his office, No. 50 Exchange Building, San Francisco, California.

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

**Is the Cheapest and Quickest Pan**  
Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Solders made on the same principle excel all others—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
**PACIFIC FOUNDRY,**  
1st San Francisco.

## FOR SALE!

**PATENT RIGHT OF  
HUNT'S WINDMILL** for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known.

Apply to  
**E. O. HUNT,**  
128 SECOND STREET,  
11v24 San Francisco.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the  
**HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, talcums, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.  
1v14-3m JAMES HITCHENS.

NELSON & DOBLE,  
AGENTS FOR

## SAN FRANCISCO BRUSH FACTORY,

No. 211 California st., manufactures to order all kinds of

## BRUSHES,

At lower prices than cost of Eastern Importation. Brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root fibers; also, Sledge Brushes from the same material. The Patent Batan, Street, stable, Flue and Furnace brush, for which they have the exclusive right for the Pacific Coast.

All orders from the interior promptly executed.  
**FELDMAN, SIMPSON & CO.,**  
1v14q, Proprietors.

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.**  
The invention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:  
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850  
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.**  
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wooden frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movement of the revolving jaw, B, and the dotted line shows the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the jaw, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. C represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:—

Rawhide Ranch, Tuolumne Co., Sept. 28, 1886.  
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I feel much pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR.** This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1886, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

The following testimonial respecting the effectiveness of this Crusher, with explanation of its machine, will be found in the "Mining and Scientific Press," of September 29th, 1885.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street, San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C.

The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the arrest for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, are for sale by  
**V. CUSHING,**  
120 Front street, San Francisco.

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

See illustration and description of this Pump, published every other week in this paper.

LEFFEL'S  
American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

## To the Mining Community.

THE UNDERSIGNED, WHO HAS HAD THIRTY YEARS' constant practice in superintending mines, is now prepared to inspect and report on Mines and Mining Properties, and advise as to the management of the same. Office, 851 Harrison street, San Francisco.

**WILLIAM WILLIAMS,**  
Practical Mining Engineer.

**THE SOAP ROOT TRADE.**—We have made frequent allusion to the recent introduction of soap root as a substitute for pulu and curled hair in the manufacture of mattresses. The Dutch Flat Enquirer gives the following interesting information with regard to the extent and mode of this new branch of manufacture, which bids fair to assume no inconsiderable importance:

There is dug out of our mountain soil a better material for beds than is now available in the markets of the world. It is next to, if not fully equal to, curled hair for comfortable, useful and healthful beds. On little Bear river, a mile from Dutch Flat, a factory has been built seventy by thirty feet, which is soon to be enlarged to twice its present capacity. Twenty-two men are now employed. The material manufactured is the soap root, which grows in unlimited quantities in this region. It is a bulbous root, enveloped in a very tough and subtle fiber, resembling somewhat the husk of the coconut in color and appearance, but nearly as tough as whalebone. The roots are dug chiefly by Chinamen, bound in bundles of 100 pounds each and brought on poles to the factory. At \$1.50 or \$2 a day, they have lately rushed in with a larger quantity than the present capacity of the mill demands, and the market is glutted and sales have stopped for the present. The first work is to put the roots through a picker, similar to a threshing machine, which is run by horse power. This separates the fiber into a hair of eight or ten inches long, which is placed in a large vat or steamer till it becomes flexible and is freed from all gummy or glutinous matter. It is then dried on flats in the sun, put through another finer picker, turned by a Chinaman, then taken and twisted into ropes, as at a common rope-walk, then steamed again, which sets the curl. The ropes are then bound in bales, and are ready for market. The natural color is brown, but if colored black, as it can easily be, it will take an expert to tell it from the best curled hair. But the Eureka Hair Company have also in town a mattress factory, which is supplying the region with beds. The present capacity of the factory is limited to about 1,000 pounds a day, but the proprietors will be compelled to enlarge just as soon as upholsterers learn the value of the material, and they will be obliged to furnish it the moment the public generally learn the superiority of the Eureka hair over all other available materials for beds.

The carelessness of miners is almost proverbial. A late English paper enumerates the following remarkable instances of recent occurrences in that country: One man was killed by an explosion caused by lighting a fuse over a barrel of powder. In another case a miner who had lit the fuse of a blast in the face of a tunnel retired to the entrance, a distance of 100 feet, to await the discharge, of which he was soon made aware by the reception of a blow on the back of his head from a stone weighing seven pounds. At Maldon, two casks of powder and a number of drills were being lowered down a shaft in a bucket; the ascending bucket caught the other, and tilted it, so as to upset its contents. The casks burst, the drills struck fire, and the powder exploded. A boiler exploded the other day at Maryborough through letting in cold water at the time the boiler was empty. No regular engine driver was engaged, and the man in charge, in spite of being cautioned by a competent person standing by, who saw the danger of what he was about to do, deliberately did it notwithstanding, and his own and the life of another were the sacrifice.

**A NOVEL LEAD PIPE CLEANER.**—The *Rural New Yorker* says that Mr. Stephen Toby of Caton, New York, recently found that his lead pipe through which his house was supplied with water, had got stopped up with sediment from the spring, and he could devise no way to clean it—was on the point of taking it up and replacing it with a new one, when it occurred to him to employ a natural aid. He caught a slate colored lizard, common about springs and among stones, took the strainer from the upper end of the pipe and thrust the animal in head first, putting on the strainer again. Mr. Lizard could not back out; neither could he turn round—the pipe being only five-eighths of an inch in diameter. He must propel; and he did, at the rate of three or four feet per minute, emerging from the lower end of the pipe heralded by the muddy sediment and followed by a stream of spring water, which has continued to flow uninterrupted since. Perhaps the suggestion may be useful to somebody.

**REFUSING THE HONORS.**—Queen Victoria a few years since, offered to confer the honor of knighthood upon William Fairbairn, at the time President of the British Association for the Advancement of Science, but he declined the honor. Offers of knighthood have been made and refused by several of the distinguished mechanics and men of science in Great Britain. James Watt refused knighthood, as did Robert Stephenson and Michael Faraday. The latter, like Fairbairn, commenced life as a poor mechanic, and worked up to the head of his profession; is an honorary member of the Institute of France, Fellow of the Royal Society, an able author on engineering subjects, and is the inventor of the cellular hollow girder system, upon which the Britannia tubular bridge is built. Titles conferred by royalty cannot add to the honors of such men; they look upon them as mere baubles.

**POISONOUS THREADS—CAUTION.**—A late French journal states that a number of seamstresses have suffered from violent colic, in consequence of putting into their mouths the silk they use in sewing. This disease is attributed to the practice of mixing the silk with a preparation of lead (the sulphate) so as to increase its weight. A chemical analysis of many different samples of sewing silk has been made by Mr. Jones of the Chemical Laboratory, Leadenhall street, London, which resulted, in almost every case, in the detection of large quantities of acetate, or sugar of lead. This admixture is even more dangerous than that of the sulphate, on account of the greater degree of solubility of the sugar of lead in the fluids of the stomach.

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the Mining and Scientific Press, or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v14tr

## Gaston's Screw Grinder and Amalgamator

—18—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequaled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is effectually rubbed by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

**THE CELEBRATED Self Generating Portable Gas Lamp.**

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The fan must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 1v14-3m

## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**  
FOUR SIZES,  
8, 10, 12, and 15-Horse Power,

**HOADLEY'S.**  
3 to 40-Horse Power.

**HITTINGER'S.**  
THREE SIZES,  
5, 7, and 10-Horse Power

**HITTINGER'S.**  
TWO SIZES,  
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for bolting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the miner's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the uttermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by

**TREADWELL & CO.,**  
5v14-6m15p Corner of Front and Market streets.

**DEEP CRATERS.**—It is said that there are three extinct volcanic craters near Red Mountain City, in Montana, which are so deep that the light is entirely excluded from their depths, and that when a stone is thrown into them no sound can be heard of their reaching the bottom!

**WORKERS IN DEMAND.**—Mr. Charles S. Eaton, employment agent, opposite the plaza, informs us that there is an unusual demand for laborers of various classes at present, he alone having orders for over 200 men for different occupations.

**MR. ORLANDO JENNINGS**, recently of Butte county, is about establishing himself in the assaying business in Downieville. He will thus locate in a rich field for prospecting.

**COMMUNICATIONS RECEIVED.**—"The Formation, Distribution and Age of the Igneous Rocks," by F. A. Herring; "Letter from Europe," by A. S. H.

**WOODWARD'S GARDENS.**—It will be seen from the advertisement which appears to-day, that new attractions are being continually added to the variety heretofore presented.

"**SUB-POSITORY**" is the name of a new remedy for the afflicted, advertised to-day by C. Wood, No. 63 Tehama street.

**By Express.**—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must them; solves settle the same.

**Cholera.**—Perry Davis' Vegetable Pain Killer.

Mr. PERRY DAVIS, Sir:—The benefits I have received from the use of your invaluable remedy, the Pain Killer, induces me to pen a word in its praise. Experience has convinced me that for Headache, Indigestion, Pain in the Stomach, or any part of the system, severe Chills, Weariness, common Colds, Hoarseness, Cholera, Cholera Morbus, Diarrhoea, Dysentery, Toothache, etc., there is nothing better than the Pain Killer. I have this hour recovered from a severe attack of the Sick Headache, by using two teaspoonfuls, taken at thirty minutes interval, in a wine glass full of hot water. I am confident that through the blessing of God, it saved me from the cholera during the summer of 1843. Travelling amid dust, toil, change of diet, and constant exposure to an infected atmosphere, my system was daily predisposed to dysentery attacks, accompanied with pain, for which the Pain Killer was a sovereign remedy, one teaspoonful curing the worst case in an hour, or, at most, half a day! I have heard of many cases of Dysentery being cured by its use. Put in the teeth, will stop the toothache. Gratitude, and a desire for its general use, has drawn from me this unsolicited testimonial in its favor.

D. T. TAYLOR, JR., Minister of the Gospel.

Sold by all Medicine Dealers everywhere. 22v15-1m

## Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

Hooper's Patent, Aug. 15, 1865.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a

Premium Medal.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hem-packing, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

### SUPERIOR DEEP-WELL PUMP.

No. 1—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.

No. 2—Cylinder, 3 inches; stroke, 7 inches; capacity 1,200 gallons per hour; weight, 80 pounds.

No. 3—Cylinder, 4 inches; stroke, 8 and 5 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.

No. 4—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight 800 pounds.

No. 5—Cylinder, 6 inches; stroke, 24 inches; capacity 12,375 gallons per hour; weight, 1,000 pounds.

Nos. 3, 4 and 5 are

made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

See illustration of the Valve of this Pump, and further description, in another part of this paper.

STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:

June 18th—GOLDEN CITY.....Capt. Jas. T. Watkins. Connecting with ARIZONA, Capt. Harris.

June 29th—MONTANA.....Capt. Jos. Sutton. Connecting with OCEAN QUEEN, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines can be obtained at the office of the P. M. S. & Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARCO & CO.

The COLORADO will be dispatched July 4, at noon, and will be followed by the GREAT REPUBLIC on August 24th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

THE MINES OF COLORADO, by O. J. Hollister (late editor and proprietor of the Colorado Mining Journal). Springfield, Mass.: Samuel Bowles & Co.

We have received from the author a copy of the above work, which consists of a well written and finely-printed volume of 450 pages, descriptive, as its title imports, of the mines of Colorado. Mr. Hollister prefaces his work by an allusion to the near approach of the iron rail, from both the east and west, to that somewhat famous locality, by means of which it will at once become accessible from all parts of the country. Its situation in a pleasant and healthy climate, its position on the immediate line of one of the world's great thoroughfares, embracing within its limits great mineral and agricultural wealth, together with other important industrial advantages, the author thinks most eloquently invites settlement and improvement from the more crowded centers of population at the East. It must also become a famous and delightful summer resort for the New if not the Old World. Its cool, bracing and eminently pure air, its medicinal springs, its grand and beautiful scenery, and its abundance of game, must render it particularly fitted for such resort. The main object of the work, it is claimed, is to spread before the world such information with regard to that Territory as is proper in view of its claims and prospects. The work treats very elaborately upon the discovery there of gold and silver, and the subsequent settlement and development of the country—its geography, geology, mineralogy, agriculture, government, society; the progress of its mining industry, its mills, machinery, methods of treating ores, etc. The writer has done his work well—unless it may be a little overdone, a fault almost impossible from the nature of the hook and the circumstances under which it has been written. Mr. Hollister is evidently enthusiastic, and has the fullest faith in a great future for Colorado.

CORRESPONDENTS, to secure attention, should always send us their real names. We frequently receive anonymous letters, which would be used were they accompanied by the real name of the writer; but which, from the lack of that, go to the waste basket.

## The Oakland College School.

A few words concerning the peculiar nature and system of instruction of this well-appointed institution may not be unacceptable to our readers. During the past few years great improvements have been wrought, both in the system of instruction at this school and in the facilities for applying the same. It stands now a perfectly graded school, and compares favorably, in this respect, with our perfected common school system. It has three distinct departments, with their own teachers, recitation rooms and dormitories—the junior, senior English and senior classical. The separation of juniors and seniors combines the two-fold advantage of keeping the small boys from mixing too much with the young men, and of affording a constant means of emulation on just principles. With such a system, it is a great advantage for a young boy to attend a large school where there are many older than himself. Since the school is necessarily, in some respects, a preparatory step toward the college course, the senior classical department is designed chiefly for those who intend to complete their education in college. This is under the care of George Tait, A. M., former Superintendent of Public Schools in San Francisco. The senior English covers a wide range of study, suitable for those who desire to receive only a liberal education for practical science or business. This department is under the care of Assistant Principal F. M. Campbell, A. M. Here, besides the usual higher English branches, much attention is paid to book-keeping, etc. Surveying and civil engineering are practically taught in field excursions. The business department will probably very soon be enlarged, and one of the college school halls he appropriated to active business, with all the necessary apparatus. A systematic course of lectures will be obtained in the various departments. When these arrangements can all be made, and when the contemplated improvements in buildings, reading rooms, grounds, etc., are completed, the college block, which contains eight acres of land, well shaded by noble oaks, will become an object of beauty and interest to the public not to be excelled by any place of public resort in the State.

It is somewhat pleasant to observe the characteristics of the students, among themselves, in this cosmopolitan school. The advantage gained by sending a son where the thoughts and experiences of students from Washington Territory and Idaho, from Nevada, Mexico and the Sandwich Islands, are intermingled with the fertile minds of those from every county of California, is incalculably great, and worth a thousand times the seeming advantage of an Eastern education. And here let us state the fact that the graduates of our colleges on the Pacific coast who are studying in professional schools in the East and in Europe, carry such prestige with them, on account of their having been educated in this young, but opulent orient, that they become doubly successful in their professions, and receive a greater share of attention from the public.

## California at the Paris Exposition.

A telegraphic despatch from New York, of Liverpool date of the 6th inst., says that the Paris correspondent of the *Times* complains that California hardly makes an effort at a display of her mineral resources. "Her free gold is barely represented, and no adequate idea of her resources can be formed from it.

The above result is what was expected and foretold by several of those who were most actively engaged in arranging the details in this city, for California's share in the Exposition. The "Exposition Committee," after due deliberation, published an address setting forth what was needed in order to secure a proper representation of our interests and resources at the World's Exposition, which address was followed by an appeal for the funds requisite to make the necessary mineral collections, arrange and classify the same, and print and publish such information as would make our exhibition useful and valuable. If the exhibition proves a failure, it will not be the fault of the committee who had it in charge, or the Commissioner who goes to Paris at his own expense, to represent the great State of California at the World's Fair. The collection of specimens, forwarded by Dr. Dupertren, we presume, is the "display" of minerals alluded to in the telegraphic dispatches. That collection cannot be of any practical use as an index of the extent or value of our mineral resources, by reason of its utter want of classification and description. How far Prof. Blake will be able to remedy this deficiency, upon his arrival there, which will be about this time, we shall soon learn. The Professor, we believe, took with him a private collection of his own, with such additions as he could make, at his own expense, and in the limited time allowed him.

It is greatly to be regretted that California, which is generally liberal in every important work, whether of a public or private nature, whether of State interest or in aid of philanthropic efforts, should have neglected, in this instance, to furnish the pecuniary means by which alone success in anything of this kind can be accomplished.

ROYALTIES IN MINING.—Quite a number of Eastern inventors have endeavored to introduce patent processes and machinery for a royalty on the increase of gold or silver which may thereby be obtained. Nobody has ever sold a right on any such condition, and no one over will sell such a right in California. The very fact that parties are trying to effect such sales is the best evidence that they know nothing about mining on this coast. The thing is impracticable—utterly so. The sooner inventors, with such notions in their heads, stop expenses of advertising and printing, with such an end in view, the better will it be for their purses. If an Eastern or any other inventor has anything really valuable to sell, in the way of saving gold or silver, he can readily find purchasers in California, if liberal and practical terms are offered; but not otherwise. Californians are practical men, eminently so.

SODIUM AMALGAM.—John Taylor & Co., at 512 and 514 Washington street, are now in the regular receipt of sodium amalgam direct from the establishment of Mathey & Co., London, put up in packages of from one to twenty pounds of twenty-five per cent. sodium. The amalgam of this strength is sold at \$2.50 per pound, by twenty-pound packages, and \$3.00 per pound in single pound packages. They have also the amalgam manufactured in this city, of five per cent. strength, which they sell for \$1.75 per pound by the quantity.

Sodium amalgam is slowly coming into use; much more slowly, however, than its merits as an aid in gold saving would seem to warrant. When used with judgment, there can be no doubt of its value. We see it stated that it is giving good satisfaction at the San Juan del Rey Gold Mining Company, in South America, and in the Real del Monte, of Pachuca, one of the largest silver mining companies in Mexico. The sodium amalgam imported from London is claimed to be far superior to any before offered in this market. It is manufactured under the British patent of Wm. Crookes, Esq., F.R.S. A pamphlet, entitled "Observations on the Process of Extracting the Precious Metals by means of Sodium Amalgam," can be had on application to Messrs. Taylor & Co.

SCIENTIFIC EXPLORATIONS.—Prof. Whitney, State Geologist, left on the steamer on Monday last for Oregon, whither he goes for the purpose of making a scientific exploration of Mount Hood and vicinity. There seems to be quite an unusual call, of late, for scientific explorations on this coast. In addition to the heavy work of the Geological Survey of this State, Prof. Gabb has just returned from quite an extended scientific exploration of Lower California, and has again left, as elsewhere stated, for the exploration of the southern portion of the State of Nevada. Prof. Kellogg, as we have already stated, is about to start for our newly-acquired possessions toward the North Pole; and the party under the direction of Prof. King are well on their way to explore the line of the Central Pacific Railroad. The desire for reliable information of this kind is on the increase, and augurs well for the future progress of the growing empire of the west.

THE State Agricultural and Mining College has been located, by order of the Directors, in Alameda county. The vote stood, four for Alameda, two for Napa. The precise point of the location has not yet transpired. We presume, however, that it will be somewhere between the point where the Telegraph road strikes the foothills and the future site of the College of California. The Deaf and Dumb Institute has been located in that vicinity. We have already fully expressed our opinion with regard to the propriety of that location.

PICNICS.—All in search of health, pleasure, or recreation, will find Woodward's Gardens one of the most desirable places of resort this side the garden of Eden.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Letter from London.

BY A. S. HALLIDIE.

MESSRS. EDITORS:—A flying trip through the Old World, among its shops and manufacturing, its mines and quarries, its railways and water-courses, its churches and theaters, scarcely enables one to properly note the changes which have taken place within the past fifteen years.

The railway system has been greatly extended, especially in England, and most of all, in London. It there runs through the streets, and under and over them—crossing the river Thames by numerous bridges, where, fifteen years ago, there were none, and almost taking one from the door of his house and landing him, in a few minutes, in the city. I remember very well the crash and jam of carriages and people that used to occur every day on Fleet street, before the extension and completion of these lines; and now, with a population increased by nearly one million, Fleet street is not so crowded as it was then. The cause is obvious; and some such method must be adopted to relieve Broadway of the immense traffic and crowd thrown upon it near Maiden Lane. I do not think Fleet street could beat Broadway much in its busiest days.

## LONDON RAILWAYS.

The Metropolitan Railroad, or, as it is usually called, "the underground," is a matter not only of convenience, but of necessity; and its success in London, where it had to encounter so many expensive difficulties, in the cutting of main sewers, vested rights of property-holders, and the opposition of omnibus and cab-owners, (although it was generally regarded as a good joke, and its failure predicted) besides having branches to build off from the main trunk, is sufficient evidence of the success which would attend such a road in New York, if economically built and managed. The long, narrow form of the business part of that city would require but one trunk, which would command the entire business.

The other line in London, so convenient to business men, is the Charing Cross—Cannon Street Railway—which, starting from where Hungerford Market used to stand, crosses the river Thames over a lattice bridge which has supplanted the old chain suspension bridge (which latter is now erected across the classic Avon, at Clifton), runs across the river to the south side, stopping on the way at Black Friars, recrosses the river at another iron lattice bridge, and lands you at Cannon street, just six minutes from the time of starting, giving you a return ticket, second class, for 12c. Trains leave each end every ten minutes.

## A GREAT RAILWAY CENTER.

Let us go out to Clapham Junction. Here we see an accumulation of lines running in all directions, which sadly confounds confusion. This is the converging point of the south coast trade, and the whistle of the locomotive is always shrieking, while the arms of the signal stations are apparently thrown up wildly and in despair; but yet in the hurly burly, the scream and the rush and the throwing up of signal arms—all goes on well; but the eye gets tired of leaping from line to line, as new trains make their appearance from points least expected. Usually at this junction there are eighty trains per hour passing over the rails; and yet, with all this hurry and bustle, the officials are civil, as far as I have found, from the top down, and certainly, from the many questions put to them by scared old ladies or swell-headed young gentlemen, it strongly conveys to my mind the fact that patience is a virtue.

## STEAMERS ON THE THAMES.

The little steamers on the Thames, which carry passengers so cheap, are good specimens of how to wiggle your way through difficulties, or a crowd; and it is still more singular when we consider the poor facilities the captain and helmsman have for rapid action. If the captain wants to go slower, he motions to a small boy, who deliberately sings through his nose, "ease har!" or to go ahead, "mov-ve a-a-r'ead!" while the man at the wheel is clear aft, and watches the motion of the captain's hand; but yet they get along finely without accident.

## THE THAMES BRIDGES.

It is marvellous to note the number of bridges which have been built across the Thames within the past twelve years. One or two are very handsome, especially the new Westminster Bridge, which, to my eye, is the most beautiful one I ever saw. There are seven elliptic arches; being built with cast iron ribs, it has a very light crown and elegant balustrade. This structure was designed by a Mr. Page, and is a credit to him and an ornament to the river. There is also a very pretty and unique suspension bridge at Chelsea, designed by the same engineer. At Lambeth there is a structure which would not be considered very creditable even in California. It is a suspension bridge, but possesses neither architectural beauty nor fine lines. The roadway is out of adjustment, and the general appearance of the work is as if it had been put up cheap. Now a river, like the Thames, running through the largest and most wealthy city in the world, should possess structures somewhat in keeping with the means and position of the city; but the stream has heretofore been allowed to run its own course, in every sense of the word, until the senses, especially of seeing and smelling, rose in rebellion against Father Thames being used as a common sewer, without being open to be sued.

## THE EMBANKMENT OF THE THAMES—AN IMPORTANT IMPROVEMENT.

The matter of improving the river has recently been taken hold of, and there is now to be seen gradually rising upon each side of the river an embankment, fine in design, solid in workmanship, and elegant in character of material. It will be, when completed, a wonderful improvement over the old mud flats, back-yard deposits of decayed vegetables, outlets of sewers, etc., which now meets the eye. The embankment is making progress, but the Londoners say *very slowly*. It is far advanced between Westminster and Waterloo bridges. These sections were to have been opened by the first of May, 1867, but this is out of the question. The delay in the opening of the first section is occasioned, to a great extent, by the dilatoriness of the Metropolitan Railroad company, who have the right of way under the embankment. The company, I understand, is not anxious to build the road underground at this point, thinking it can get a bill through parliament empowering it to build on the embankment—in fact, it is said that the railroad company has determined to commence work, if compelled to, only after the embankment is completed. As this will be so very unpopular, requiring its further tearing up and delay in opening, it thinks that there will be no difficulty in obtaining the right of way at some distance back from the water front.

## THE NEW BLACK FRIARS BRIDGE

Is progressing slowly, on account of the substratum of London clay having been scoured out to a great depth, by the action of the contracted current, in the piers already laid. A much greater depth has been required than for the old ones, and the contractor has already reached a depth of ninety feet before striking the compact clay. It is expected that two years further will be required; in the meantime a temporary bridge is being used, which is decidedly not ornamental.

## THE PNEUMATIC DISPATCH COMPANY

Have a considerable amount of piling in the river preparatory to laying its tubes, a full description of which I think you have already published.

Everywhere, throughout London, evidences of great improvement and tearing down, especially for railway extensions, seems to be the rage. There is one solid and necessary improvement to take place in the Strand; that is the widening of this thoroughfare near Temple Bar—the destruction of this bar, and the erection of magnificent law offices.

## The Reese River Country and its Mines.

BY A. J. HOWE.

[Continued from Page 370.]

## NORTHUMBERLAND DISTRICT

Is in latitude  $38^{\circ} 50'$ , fifty-two miles distant, in a south of southeast direction from Austin. From Blackbird Cañon, located a few miles east of Austin, our road follows south on the Belmont and Ophir Cañon stage road thirty miles, from whence we strike diagonally across the plain, in a southeast direction, for twelve miles, which brings us to the mouth of Steeple Cañon, named so from the vast number of steeple-like monuments that line its margin. These are composed of a stratified sedimentary rock, of quite recent origin, yet but imperfectly hardened, and probably formed in the following manner: The cañon, at no very ancient day, has flowed full of this substance, in a liquid state, from the mountains above. This flowing has apparently been gradual and periodical, as the strata alternate with the pulp abrasions of grayish slate, of which the mountains at the head of the cañon are composed, and white volcanic tufa, which forms the hills lower down, with an occasional stratum of perfectly smooth-washed pebbles. More recent washings have nearly cleared or worn out the channel as it was originally, leaving only islands and occasional masses along the border, which have been worn by the rains for ages into symmetrical forms, like steeples and monuments. The same thing occurs, on a grander scale, on the Upper Platte, in Nebraska (Chimney Rock and Scott's Bluffs), also in Utah (Steeple Rocks, or Pyramid Circle).

About seven miles up the cañon we come to an extensive meadow, out of which burst numerous springs. Here a large quantity of hay can be cut, and the spot is claimed for that purpose by Wm. N. Cummings, the pioneer of Northumberland. There is also a fine mill site here, owned by the Northumberland company, who have already erected a dwelling house.

Northumberland District was discovered in June, 1866, by Wm. N. Cummings and J. C. Merrill, from Mammoth District. The former returned in July, and discovered the famous Northumberland and Lady Cummings ledges. About the 6th of July, the district was organized, with Mr. Cummings as Recorder. The obnoxious State mining law then in force was adopted, and has not been since repealed by the miners, although it is no longer the law of the State. By this time about thirty prospectors had found their way here, and before August, twenty distinct lodes had been discovered, which number has been greatly increased since. Many of these were of wonderful richness. A considerable quantity of ore was taken to the Keystone mill, at Austin, in September and October. It was principally from the Detroit, Cedar Point, Northumberland, Lady Cummings, and Richey & Hussey lodes. The average working of all the lots reached full \$200 per ton, the highest working being from the latter—a lot of ten tons gave a yield of \$2,800, or \$280 per ton. The next was the Cedar Point—\$195 per ton.

As we ascend from Steeple Cañon, we come suddenly upon the massive croppings of the Northumberland, the great lode of the district. It is situated at the base of the highest peak in the vicinity, and crops out along the mountain for 1,200 feet. Its average width is twelve feet. It has been opened in five or six places, at intervals of one hundred feet, in every instance showing a fine body of ore. At one point a tunnel was run seventy feet; from this, ore was taken that yielded, by assay, \$430 per ton. Clippings taken along the entire length of the surface outcrop, with a view of ascertaining the average, yielded \$39 per ton. Another test of 800 pounds, taken from the same source, with very little selecting, worked at the Keystone mill \$69 per ton. The apparent dip of the lode is west into the mountain; but, like the great Comstock lode at Virginia City (which it closely resembles in many features of surface indica-

tions), I think its permanent dip will be to the east, and I will give one reason for this theory. A short distance east and lower down the hill a small chimney of extremely rich ore was found in August last, from which nearly \$3,000 was taken in a few days. This chimney gave no indication of a continuous lode, but appeared to have been forced up vertically from a larger mass below. The enclosing rocks of the lode are syenite and slate on the west, and granite on the east; its trend is north and south.

About 300 yards east occurs an immense quartzite, with a northeasterly trend, in the center of which occasionally occur pockets of rich antimonial sulphuret of silver and black oxide of copper. This great lode, 200 feet wide, has been located as the Stoney Point. A half mile south of the Northumberland, we come to a narrow belt of granite, in Cedar Point Hill. In this belt are located two of the richest lodes in the district—the Cedar Point and Lady Cummings. The latter is eight feet wide and moderately rich throughout. A few tons from this were hauled to Austin in October, which worked \$130 per ton. The Cedar Point is eighteen inches wide, but extremely rich. Three thousand pounds, without the least selecting, worked at the rate of \$195, while the richest streak of three inches works \$550 per ton. These two lodes are about 100 feet apart, and most favorably situated for development by a short tunnel. The small settlement or camp of the district is in the ravine at the foot of this hill. A few rods below, there is an immense bluff of quartzose rock, the eastern face of which fronts the cañon rises perpendicularly seventy or eighty feet. This bluff is superstitiously avoided by the Indians, owing to its tragic history, given by them as follows: Forty years ago, a famous Shoshone Chief, in the chase, followed a mountain sheep to this summit. The animal, being cornered, fought desperately, and in the contest both were thrown over the cliff and instantly killed. The Indians of this vicinity also tell the story of a white man and small child wandering here twenty years ago. Becoming hopelessly lost, they remained with these Indians a long time, till finally both died. Might not this reveal the fate of the only survivors of a fearful massacre, or terminate the hope and watching in some family for lost ones who are never to return?

A half mile west of Cedar Point Hill there is another belt of granite, in which two fine parallel lodes, called the Fowler and Clark, are located. But a small amount of work has been done on them up to January. However, they gave great promise, showing a very high grade of ore throughout the whole width, particularly the westerly one, which occurs at the junction of the primitive limestone, or between it and the granite. The Detroit is located one mile southeast of the latter. Seven tons of ore from this mine was taken to the Keystone mill, at Austin, in September last, and worked \$173 per ton.

Three miles further south, we come to the Central. This is an immense lode, cropping out a long distance, and is second to none in the district in promise, when we consider the character of the ore, which is so evenly distributed through the great width of quartz that no selection can be made, while it gives a uniform assay of \$54 per ton from the croppings; no work of any consequence having been done on it.

The immediate vicinity of the mines here is not very well supplied with wood; but there is a great abundance within a mile and a half on every side, sufficiently near to offer no objection whatever for reduction purposes.

I have been thus explicit in detail in describing Northumberland, because I consider it one of the solid districts of Central Nevada that has not thus far received the attention it really deserves; also given figures of working results, the truth of which I can vouch for. I notice in the Silver Bend Reporter the discovery of a rich lode located in the hills north of the western entrance to Charnock's Pass, which must be in the southwest corner of Northumberland, proving the existence of mines in all parts of the district, which is ten miles square, extending north and south from Steeple Cañon to Charnock's Pass, and east and west from Smoky to Monitor Valley.

[To be Continued.]

**Dog Power.**—One John Smith, owning a ranch near Yuba City, has put up a wheel eighteen feet in diameter, which he works by dog-power to raise water for his stock, etc. Mr. Smith is a sensible man. We say to our swine, "root hog or die;" would that every dog owner in the State was compelled to say to his canines, "work, dog, or die," and make them do it too.

## Mechanical.

## The Bessemer Process in Troy.

The Troy (N. Y.) Bessemer Steel Works were put in operation, for the first time, on the 9th ult. The starting of these works was attended by a large number of distinguished gentlemen and persons more or less intimately connected with iron manufacture throughout the Eastern States. The machinery connected therewith is complete in all its details, is of the most approved character, and designed to economize, to the utmost, the physical labor connected with such an establishment.

The iron, after being weighed, is raised by hydraulic power to the cupola, which is very high, on account of the necessity of a slight descent at every subsequent process. A charge for the furnace is five tons—the loss from the crude pig iron to the finished bar or steel ingot averaging about sixteen per cent. From the cupola the iron flows into a huge ladle, capable of containing the whole five tons, in which it is conveyed to the converter, all by machinery.

Having been there placed, the blowing operation is put in action, and for about fifteen minutes a body of condensed air is forced upward through the molten iron in the converter. At this moment, a small amount of "speiseleisen," which has been melted in a small furnace near by, is introduced into the iron in the converter, and instantaneously the entire process of conversion is completed. This "speiseleisen" is used as a hardening alloy, and is equivalent to the metal manganese, titanium or Frankinite, all of which are used as alloys for hardening and improving iron and steel.

After the conversion is completed, the converter, which is hung upon pivots, is readily turned, so as to pour its contents into a second ladle, which is so arranged as to move readily along in front of a range of ingot molds, each of which are filled in rapid succession, with very little use of muscular power. Within thirty minutes from the time the iron is tapped from the cupola the entire mass of five tons, less the waste, is deposited in the ingots.

The ingots, while yet hot, are placed for a short time in a furnace, to equalize the heat, which has fallen somewhat on the surface, and then immediately passed through the rollers, to be shaped into any desired form for manufacturer's use. From four to six operations from the cupola to the rolled iron and steel can be effected in a day of ten hours. The economizing of fuel and labor seems to have been carried to its utmost limit.

The use of Bessemer iron is fast becoming universal. As now manufactured, it possesses a homogeneity, purity, toughness, strength and malleability which will admit of its use, with slight variations in its manufacture, for almost every one of the thousand purposes to which in any of its various forms is applied. It is said that 200,000 tons of this metal was produced in Europe last year, and the consumption is constantly increasing. Twenty works of this character are now in operation in England alone, eight in France and Belgium, seven in Prussia, ten or twelve in Austria, and about the same number in Sweden. In this country, the Pennsylvania Steel Co., at Harrisburg, the works of E. B. Wood, Esq., at Wyandotte, N. Y., and the works above mentioned, belonging to Winslow & Griswold, of Troy, N. Y., are the only ones working under the Bessemer patent.

THE ST. LOUIS BRIDGE across the Mississippi, will be 2,700 feet long and fifty feet above high water mark. It will be necessary to bridge the length of two blocks before coming to the city grade. There will be two spans over the main steamboat channel of 350 feet each. It will be built of iron, and cost about \$5,000,000. There will be upon it two double-track carriage ways and one railway track.

## Aluminum Bronze.

Aluminum promises to become quite valuable as an alloy for copper. It is found to add greatly to the tensile and resisting strength of copper and bronze. These metals are also thereby rendered more malleable, and much improved in foundry qualities.

Experiments at the Woolwich (England) Arsenal have proven that aluminum bronze possesses a tensile strength of 73,000 lbs. per square inch, against only 35,000 for gun metal! It works under the hammer almost up to the melting point, and can be drawn out as fine as a needle. It is three times more rigid than gun metal, and forty-four times more rigid than brass! It is less expansible by change of temperature than either. It does not clog a file or lathe in working it, while it can be worked with less difficulty than steel. It is excellent for screws, and notwithstanding its excess of cost in the rough, it is thought to be cheaper in the end. It tarnishes less readily than any other metal used for mathematical, philosophical or astronomical instruments, for which it is said to be also otherwise superior to any other metal which can be used. It is remarkably well suited to receive graduation, as it takes a very fine division, admitting of clear and distinct marking. It can be soldered with either brass or silver solder. It admits of being rolled, which gun metal does not. It must eventually come into very general use for philosophical instruments. Each successive melting, up to a certain point, improves its tenacity and strength.

The best alloy for strength, as for gun metal, is ten per cent. of aluminum added to the bronze or copper. Its cost, at that percentage in England, is about \$1.20 per pound, which is almost four times that of gun metal; yet, in strength, one-half of the former is stronger than the usual weight of the latter. For a great variety of purposes, the difference in the cost of the material is no object in comparison to its superior advantages. Even one part, only, of aluminum to ninety-six of copper and four of tin gives a perfectly homogeneous alloy, of fine color and great hardness and malleability. This alloy does not oxidize in casting; hence there is no loss from the amount first added, no matter how often it is melted. The improvements and increased facilities for the production of this metal must soon render it so cheap that its great advantages as an alloy cannot fail to secure for it a very extensive introduction into the arts in all the specialties named.

**MACHINE DRILLING.**—A rock-drilling machine was recently taken up to the summit tunnel on the Central Pacific Railroad, and set to work. After a thorough trial, it has been condemned and set aside by Mr. Stanton, the Superintendent, who says that in hard rock no machine appears to him to be practicable which does not strike its blow with a hammer. The blow is given to the drill in this machine by means of a spring.

**MODIFICATION OF WOOD BEARINGS.**—The bearing for shafts for screw propellers adopted by many engineers, is to surround the shafts with casings of brass, the inner surface of which are grooved so as to receive fillets of wood. Through the spaces formed between the fillets, water is allowed to flow freely between the shaft and the bearing, keeping the whole cool, and acting as a lubricator. Another modification of the invention is to fix the wooden fillets on the shaft, which then rotate with it in the brass bearings.

THE effect of wind, blowing against a square chimney, it is said, is twice as great as when blown against a circular chimney of the same dimensions. The form of the latter diverts the strength of the wind.

A LATE Boston notion is to generate steam with the aid of waste coal dust, very fine, injected by a current of compressed air into the space over the fire, where it is said to burn with an intensely hot flame, greatly increasing the production of steam.

## Scientific Miscellany.

## Water-Spouts---their Phenomena.

The season is approaching when these phenomena are usually of frequent occurrence in the more mountainous districts of this and the neighboring State of Nevada. A greater or less number of these terrible cloud bursts are witnessed every summer and fall, all along the higher slopes of the Sierra Nevada; and were those regions as densely populated as some other portions of the State, a much larger amount of property and many more lives would be annually sacrificed by such agencies than have hitherto been chronicled. The water-marks high up on the rocks of many of the mountain cañons, and the immense boulders of many tons weight, often found at great distances from their outlets, afford abundant evidence of the sudden and irresistible force of these destructive phenomena.

From the frequency of such phenomena in this State, it would appear that the conditions of their occurrence are more than usually favorable on this portion of the Pacific Coast. Water-spouts evidently consist of dense masses of aqueous vapor, often, but far from always, presenting gyratory as well as progressive motion. It is a matter of no little astonishment to many how it is that they are capable of discharging such immense quantities of water as generally attend their occurrence, especially where the circumstances do not allow of the supposition that it may have been collected from ponds or rivers, as is sometimes the case.

The more recently observed phenomena attending water-spouts prove that electricity, rather than a confluence of opposing currents of air, is the chief agency in their production. Sometimes two storm-clouds approach each other from opposite directions, and usually at different altitudes. On arriving at a position directly vertical to each other, their progressive movement generally ceases, especially if they are in the same electrical condition. The meeting of clouds in this manner, always results in a thunderstorm of somewhat more than ordinary violence, and not unfrequently culminates in a tornado or water-spout—one or both. Under the latter conditions the lower cloud, which has probably been throwing off heavy discharges of electricity, will rapidly unite with the one above, and as rapidly send down toward the earth a cone-shaped projection, which soon reaches the ground and establishes between it and the cloud a direct electric communication. The electricity of the cloud will now pass off through this cone, as through a conductor, and the detonating discharges will cease, so far as relates to that cloud and the earth; but in their stead will most likely appear a destructive whirlwind, and if there be sufficient moisture in the air, a water-spout will be the final result.

Whether this sudden condensation of water is due to the extraction of electricity from the atmosphere, or whether the aggregation of water is produced by some other cause, and the liberation of the electricity the consequence of that aggregation, is a point with regard to which the "doctors" are not yet agreed. All, however, are agreed in the fact that electricity is in some way or other the chief agent in converting what would, under ordinary circumstances, be a common rain-cloud, into a tornado or water-spout.

But all such phenomena are not the result of a mere meeting of opposing clouds. It sometimes happens that a small, isolated cloud will suddenly appear in a quiet atmosphere, and rapidly enlarge into huge proportions, while marked activity will be manifested about its outer edge, by a rush of air from every direction toward itself as a center. Such are called electrical clouds, and they are always attended with a greater or less reduction of temperature, thereby causing the invisible moisture of the atmos-

phere to rapidly pass into the form of a dense mass of cloud. The temperature often descends considerably below the freezing point; sometimes merely causing the vapor to crystallize into snow, but usually freezing it, in greater or less quantities, into hail. When the decrease is very great or sudden, hailstones half as large as hen's eggs, or even larger, are formed. Of course the aggregation in such cases takes place very rapidly, sufficiently so as to allow of an increase from the smallest crystal of ice to the largest sized hailstone, during the time occupied in descending from the point of first increase to the spot where it reaches the ground. The largest of these hailstones are no doubt often produced by the striking and freezing together of one or more smaller ones during their descent.

The air rushing inward, as above described, from all directions, is rapidly borne upward by the vortex motion immediately established; while the moisture contained in the huge converging current is so much condensed on its entrance into this cool, electrical cloud stratum as to remain below, while the air itself passes upward and outward, strained, as it were, of the moisture which it may have brought in from the surrounding atmospheric regions. It is thus, no doubt, that the large amount of water due to these phenomena is suddenly gathered up—the atmosphere for miles around is strained of its moisture, which is thus poured into the vortex of the water-spout, where, as soon as the proper electrical connection is made with the earth, it is suddenly poured out in these destructive torrents which sweep on with such devastation to the plains and valleys below. Admitting this theory to be correct, and reflecting upon the large amount of moisture held in suspension in every cubic yard of atmospheric space, where the thermometer marks a high temperature, there need no longer be any special wonder whence these phenomena derive their immense floods of water.\*

The electrical connection spoken of is produced as follows: An electrical cloud is always charged with the positive fluid, while the earth below is negative. An electrical attraction is thus established between the cloud and the earth, and the cloud is brought downward by electrical affinity rather than by the force of gravitation. The quantity and rapidity of such approach, however, depends both upon the energy of the electrical attraction and the specific gravity of the cloud itself.

The action of this electrical attraction is manifested upon the water by the agitation and boiling appearance which that liquid presents, as the cone-like projection of the cloud gradually reaches down to the surface. On land, this action is shown by its effects on such loose and oppositely electrified bodies as it encounters. When it approaches a good conductor, the electricity is conveyed quickly away to the earth with a rapidity due to the capacity of the conductors encountered. Every pointed spire of grass, every tree, every piece of iron having a good ground connection, will act as a conductor; while light bodies, oppositely electrified, will be attracted and often lifted up toward the cloud, independent of the lifting force of the whirlwind, and held in suspension until their negative electricity is neutralized, when they will fall easily back again, perhaps to be again lifted up, and so on.

Heavy thunder, vivid flashes of lightning, and fiery balls and sparks of electricity, often accompany these phenomena, and the smell of sulphur is sometimes apparent (perhaps more often ozone). It is said that the curtains in a room in a house in Chateaufort, France, were once considerably discolored by the action of sulphurous gases so liberated. It is also recorded, on good authority, that during a storm, encountered many years since, by the British ship *Albemarle*, off Cape Cod, a mass of bituminous or jelly-like substance fell into the ship's boat that hung over the stern, diffusing a strong sulphurous odor, and which was consumed where it fell, notwithstanding efforts were to extinguish it by water and to throw it overboard by means of long sticks, as it could not be conveniently reached by any other means.

All the phenomena attending these occurrences are subject to an infinitude of variations, according to the nature of the cloud, the conducting powers of the various bodies involved, and the greater or less insulation of the substances connected therewith.

\*We are not aware that this theory has ever before been put forth to account for the sudden collection of such masses of water as are often poured out from water-spouts. It may be old, or it may be unphilosophical; if the latter, the fallacy may be placed to the charge of the editor of the Press.

## Foundry and Machine Work.

**THE FULTON FOUNDRY—HINCKLEY & Co., PROPRIETORS.**—The lively aspect of things about the foundries at the present time, is a strong indication of the improvement of business all over the State. We looked into the Fulton Foundry a few days since, and found a large amount of work of various kinds in progress there, as well as elsewhere. Everybody was busy, so much so that we were assured the proprietors had been compelled of late to run their works a considerable portion of time both day and night in order to keep up with their engagements. We are pleased to note such indications of prosperity in the foundries and machine shops of this city. We always know when our home mechanics are driven with work, that there is an unusual activity everywhere up and down the coast, and throughout our vast interior. There is never a demand for the implements of labor, except when labor itself is in demand. The industry of a people is the wealth of a nation. Work for all, and good pay for that work, is the foundation of national prosperity, happiness and contentment.

Californians ought to be a happy, a prosperous and a contented people. The soil of their valleys is the richest the world can produce, while their broad acres can almost feed a world. Their mountains, from base to crest, teem with treasures of mineral, in profusion and value nowhere else to be found. Before them is spread out the noblest ocean which the sun shines upon—its shores and islands filled with countless millions of people, just awakening to the realities and benefits of civilization, and who look to the commercial metropolis of our Golden State as the great *entrepot* for their productions, and the source from whence they are to receive the precious metals which they so much covet.

These are just the very conditions which are needed to build up our mechanical interests. While other interests must spread throughout the coast and interior, the peculiar position of San Francisco must make her essentially the machine shop of the Pacific coast. Already our foundrymen, who cover several of the largest blocks in the city, are looking around for less contracted quarters, where they can have room to grow into the magnificent proportions, which the future of our State points out as the inevitable result for all who continue in the business, and grow up with the growth of the city.

But to come back to the present; as we were saying, everybody is busy at the Fulton. Among a large amount of general work we noticed some heavy shafting, etc., intended for a newsawmill, now being erected at Eureka, Humboldt county, by D. R. Jones & Co. This mill will run a circular and a muley saw, a gang and sash saw, all driven by a powerful engine, with an 18-inch cylinder and 48-inch stroke. The well-known Brodie crushers are made at this foundry—the invention of Mr. James Brodie who is now acting as foreman of these works. We noticed one of these crushers nearly completed for a mill near Virginia City. We also noticed a heavy punching machine, ordered for the especial purpose of punching the iron for the pipes now being made for the Spring Valley Water Works. There is to be upwards of twenty miles of this pipe made for that company; and as the labor of punching will be a very heavy job, it has been thought a matter of economy to order the construction of a special machine for that work. This foundry is putting some extensive repairs upon Monumental Fire Engine, No. 6, for the city. They are putting a new style of pump upon the machine, the invention of Mr. Hayes, the Superintending Engineer of the Department.

**A PRACTICAL METALLURGIST.**—A special notice in another column, announces the services of a young man of high attainments, whom we consider capable of making himself exceedingly valuable in the right place.

**AN IMPROVED BALL ALLEY.**—James D. Patrick, of this city, has invented and made application, through this office, for a patent for an improvement in ball alleys, whereby the use of pins, and the necessity for setting them up after being knocked down, is dispensed. The balls are also self-returning. Instead of the pins in ordinary use, targets, presenting different sized faces, are arranged across the end of the alley, at which the balls are driven. These targets are five in number, the center one being very small. When it is struck, a red card or door, placed just above it, swings back out of sight. If it is struck so squarely that the ball comes directly back without rolling off the alley (the alley is slightly inclined for the purpose), it constitutes a "ten-strike;" if the ball leaves the alley, it counts only five. If the ball strikes either of the two outside targets, a white card or door swings back, and the count is less; if it strikes the second target from either right or left, a corresponding count is made. There are other details and matters of skill with regard to the game, which serve to make it both interesting as a game and useful as an exercise. The cards or doors spoken of are replaced in position by merely touching a lever on the right of the bowler, so that there is no necessity for any attendant whatever at the lower part of the alley. Both the alley and the balls are made lighter than is usual in the mode of construction generally adopted. The principal design of the invention is to lighten the cost of attention, reduce the noise in the alley, and make the game a more desirable one for quiet people who dislike undue excitement and noise. The alley is on exhibition at 751 Market street.

**NEW INCORPORATIONS.**—The following companies have filed their certificates of incorporation since our last issue:

**PIONEER TOW LINE,** to purchase and build boats to navigate the Pacific Ocean and waters of California. Capital, \$30,000; 1,500 shares of \$20 each. Trustees: E. Winslow, B. W. Meyer, S. R. Peterson, B. H. Madison, and Louis Fraunge. June 14th.

**SAN PEDRO G. & S. M. Co.,** to mine in Amador County. Capital stock, \$160,000; 1,600 shares, \$100 each. Trustees: P. H. Cramer, O. Dickinson, Jr., C. W. Kellogg, L. A. Sanderson, and J. H. Kinkad. June 20th.

**THE NEWTON MINING COMPANY,** filed in the County Clerk's office a certificate that their office and principal place of business has been changed from the mine, in Amador county, to this city. June 17th.

**FARMERS' AND MECHANICS' BANK OF SAVINGS,** for the accumulation and investment of funds and savings. Capital stock, \$150,000; 1,500 shares of \$100 each. Directors: Henry Dutton, James Laidley, Geo. H. Wheeler, S. L. Palmer, Reuben Morton, B. H. Freeman, Geo. M. Condon, N. C. Fassett and Isaac E. Davis. June 29th.

This institution is gotten up expressly to meet the views of the large industrial classes. Here the mechanic, small dealer or depositor, can deposit his funds—either for a long or short period, as his circumstances and necessities dictate, and loan it for a longer or shorter period as he may desire. Two classes of depositors will be recognized, viz: dividend and commercial depositors. The dividend depositors are mutual recipients of the profits of the institution. The second or Commercial class will receive such interests on their deposits as may be agreed on, and as ordinary bank customers.

**EASTERN ADVERTISING.**—Mr. I. N. Hudson, of the firm of Hudson & McCarty, of this city, recently left for the East, where he will open a branch agency. New York business men have been less sagacious about advertising in California the advantages they furnish their line of purchasers than European houses. More ready communication with the Atlantic States, and the rapid increase of our population and resources, will awaken the desire for a more intimate acquaintance with our population on the part of Eastern tradesmen.

**THE PEAVINE COPPER MINES.**—A copy of Hatch's new map of these mines, just published by Warren Holt, of this city, has been placed upon our table by Mr. E. M. Sleator, who is now canvassing the city for subscriptions to the same. The map is well got up, and accompanied by a small pamphlet, giving quite a full description of the mines, the facilities for working them, a historical sketch of their discovery, etc., etc. The close proximity of the Central Pacific Railroad to this locality, must add largely to its value and importance, both as a mineral and agricultural district, and greatly facilitate the development of its resources. A branch road has also been projected to connect it immediately with the C. P. R. R. The map is well got up, and fully endorsed by the public surveyors of that district, and several persons high in official position in the State of Nevada. We would suggest to all interested in that portion of our common territory, to purchase the map and examine it for themselves. It can be obtained in pocket form or mounted for a wall map.

**COPPER SMELTING FAILURE.**—According to the *Colusa Sun*, the Lyon Copper Smelting Company have made a failure in their works—their furnace "would smelt the copper, but they could not succeed in running it out." Failures from the cost of producing the metal being in excess of its value, might sometimes be allowable, especially in a fluctuating market; but a failure from the cause above hinted at ought not to be incurred. The ore is said to be rich enough to pay, and in sufficient quantity. If such is the case, the skill to obtain the metal or matte is within the reach of every company, and where judgment is used in securing it, no mere mechanical failure ought to occur.

Since writing the above, we learn the company are going ahead, and are engaged in starting a new furnace, after investigating matters thoroughly. The energy displayed by their agent, Mr. J. Weyand, does not indicate "failure."

**MINING IN IDAHO.**—Our friend, John Hemsley, writes us from Placerville, Idaho Territory, that the "False Bed-rock Diggings," in that vicinity, are doing well. Hathaway & Martin are making \$100 per day each, clear of expenses. Some companies are working over tailings, and doing well at it. Mr. H. thinks that if Dunning's under-current sluice was in use there the tailings would not pay so well. The miners on Graute creek are doing well. The Pioneer G. & S. M. Co., on that creek, are putting up a 10-stamp mill. Hon. George Hearst, of this city, is interested in that mine. The Pioneer, Centerville and Idaho are all at work, some of them doing well, with the reduction of water to forty cents for twenty-four hours and Chinese labor.

Our correspondent sends us \$35, in payment for several new subscribers, whose names he forwards, declining to deduct the usual commissions allowed in such cases, for which he has our warmest thanks.

**ORE BUYING IN CORNWALL.**—The principal portion of the best copper ores purchased by the Cornish copper smelters are received from Chili. Argentiferous ores of as low a grade as twenty-seven ounces of silver to the ton are considered valuable for their silver. The average yield of the selected argentiferous ores, as worked there, is about 270 ounces of silver—less than one per cent. of the ore. The average of the auriferous pyrites is about sixteen ounces of gold to the ton. In buying ores by the cargo, or any large quantity, six different assays are made, from various parts of the lot, which, if varying but slightly, are averaged, and the purchase made. Any assay largely in excess of the general average is thrown out as accidental, and does not come in to swell the average. For silver ores yielding 270 ounces to the ton, \$1.20 (gold value) is paid for every ounce of assay. For gold ores, about \$18 is paid per ounce of assay, *fre.*

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**AN IMPROVED CAR AXLE.**—The Sacramento Union says that experiments recently tried with an improved car axle invented by Mr. J. Graves, foreman of the Pacific Railroad machine shop, shows that in turning the curve on the track at Front and I streets about twenty-five per cent. of power is saved by the invention.

**A CAR BRAKE** for the entire train, and one which will be under the full control of the engineer, is among the late inventions at the East. It was made by Mr. S. McCambridge, and described in the *Journal of the Franklin Institute* for May. In this arrangement a barrel is, by the action of a lever, thrown into gear with the driving axle of the locomotive, so as to wind up a chain which is continuous through the entire length of the train. By this means a given strain brought upon the chain repeats itself equally in each car, thus giving an immense aggregate effect, all within the instantaneous control of the engineer. One great advantage of such a power within the reach of the engineer is to induce him to often use it as a precautionary measure in case of threatened danger, when he might otherwise run a great risk, rather than whistle the brakes down to bring the train to an entire stoppage. The advantage of such an invention, if perfectly practicable, will be readily perceived by all railroad men.

**MULTIPLYING REFLECTOR** is the name of a very ingenious attachment to the ordinary camera used in making photographs, recently invented by Mr. Rawson, of Peru, Illinois. It is so simple one is surprised that it has not been thought of before. On the same support with the camera is placed a box containing fourteen adjustable mirrors, that being the number of pictures usually made of one person. The sitter, instead of being in front of the camera, is so placed that the light from his figure will be reflected by the mirrors and sent through the lens, thus making fourteen distinct pictures. The advantages claimed over any multiplying camera are the superiority and rapidity of the work and the simplicity of the apparatus.

**A NEW MARINE TELEGRAPH.**—The *Courier des Etats Unis* says that Dr. Foucart, the surgeon of the steamer Ville de Paris, has invented a marine telegraph, which, it thinks, will come into universal use. All the disadvantages of the telegraphs now in use on shipboard are obviated. The mechanism is extremely simple and ingenious, and the principle employed has been favorably known in France for some time. The *Courier* thinks that the new invention will be especially useful on armored war vessels.

**CIGARETTES BY MACHINERY.**—A new machine for making paper cigarettes for the "Honradez" manufactory, will be exhibited at the Paris Fair, which produces three hundred cigarettes per minute, or eighteen thousand per hour.

**IMPROVEMENT IN WATCHES.**—An English manufacturer has invented an arrangement of watch movements by which the full-sized balance wheel of the English whole-plate watch is carried in the thin, flat-case, so much preferred for convenience, but hitherto excluding the perfection of structure and durability.

**WATER-PROOF SHIRT FRONT.**—We notice in a Philadelphia paper an advertisement of a "water-proof shirt front," which is described as a snow-white shield, light and pleasant to wear, looks better than linen, never rumples, and when soiled may be wiped off with a wet towel or sponge. One will last for months. This article costs but twenty-five cents, and will be a "fit companion" for the steel collar. We shall have steel shirts, socks and pants soon.

**AN EFFECTIVE FIRE-ARM.**—A new musket, by M. Galaud, a French gunsmith, has been examined by the Academy of Science, which has neither guard nor trigger, no gas escapes and no power is lost. It is very effective, and costs but twenty-five francs.

**ELECTION OF OFFICERS.**—Morning Star G. & S. M. Co., Alpine county. Trustees: F. D. Conro, O. Dickinson, Jr., S. A. Winall, H. W. Shute, M. Scott, P. Meagher, W. H. Culver. President, F. D. Conro; Secretary, C. S. Capp; Treasurer, S. A. Winall; Superintendent, J. C. Ransom. Office, No. 543 Clay street, San Francisco. June 19th.

selves settle the same.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, June 15th: The assorting floor of the Tarshish is completed, and assorting of the ore is now going on. The ore will be divided into three classes—1st, decomposed ore; 2d, rock containing sufficient gold to justify manipulation, and 3d, rock which will not pay for roasting—the latter to be worked at some future time.

The contractor on the tunnel in the Sam Booth ledge is at work in rock composed of quartz, slate and clay, giving encouragement that a ledge is in the vicinity.

## Calaveras County.

From the *Chronicle*, June 15th: A company of capitalists in Virginia City, Nev., have taken hold of Lamphear & Co's lead, in Spring Gulch, and will prospect it thoroughly. Laborers, under the supervision of an experienced superintendent, have already commenced operations, and work is being vigorously pressed forward. A shaft 50 ft. in depth was sunk on the claim by the former proprietors, and an arastra mill erected. The present owners will sink the shaft 100 ft. further, and should the lead at that depth present as favorable an appearance as it does at present, they will immediately erect the necessary machinery for successfully working it.

Copperopolis *Courier*, June 15th: Poole & Co., of the Salt Spring Valley mines, have completed their arastra, and are working it successfully. Other claims adjoining are being worked with good results.

The Plymouth Rock mine is under the superintendence of Mr. E. N. Robinson, of San Francisco. A 10-stamp mill, supplied with all the latest improvements, will be erected. The rock thus far prospects well. Mr. Robinson also intends to erect a mill and develop the cement claim on the Stanislaus river known as the Frenchman's claim.

The mill and buildings on Quail Hill are nearly completed. Work will be resumed shortly on the Keystone ledge.

San Andreas *Register*, June 15th: Work has been commenced on the Mountain Star lode. An arastra has been erected to work the rock. The company propose to find what they are looking for if it takes all summer. The claim of B. K. Thom & Co. continues to yield bountifully. They are now down 30 ft. in the shaft; \$1,580 had been taken out up to last Saturday, besides having a large quantity of rich pay dirt to sluice out. From one pocket, \$200 was taken out one day lately.

The Carson Hill correspondent of the *Alta* of this city, writing June 17th, says: At Vallecito, a tunnel has been cut a distance of 1,500 ft., at a cost of \$30,000, to give drainage 36 ft. lower than the present outlet. The Union is the only copper mine now taking out ore.

The Morgan mine, which has not been worked for 15 years, on account of litigation, is again yielding profusely. This mine from Feb. 1850, to Dec. 1851, yielded \$2,800,000, which was extracted by arastra, mortar, hand-picking and cold-chisel.

The Mokelumne Hill correspondent of the *Alta*, June 10th, says: A mine and 10-stamp mill belonging to the Mina Rica Co. the Mosquito mine and 15-stamp mill belonging to Cutter & Waters, of San Francisco, and an 8-stamp mill owned by R. H. Vance, are all standing idle at West Point.

At the Woodhouse mill, near West Point, a revolving furnace is soon to be erected, with a capacity to roast 15 tons in 24 hours.

Mr. Bovee, of the Winter mine, has finished a 10-stamp mill. He has sunk down 130 ft., and drifted 350 ft. on the vein, exposing a large body of pay dirt.

## Inyo County.

From the *Enterprise*, June 11th: Mr. Paul has just arrived from Kearsarge; he has been as far down as Walker's Pass, 100 miles below Kearsarge. He brings rich specimens of gold, silver and copper ore. Some specimens from the Silver Sprout, Kearsarge, were full of leaf silver, and are as fine as are to be found in the Comstock. Pieces of the rock which have been subjected to the heat of a blacksmith's forge are literally covered with globules of metallic silver. The mill of the Silver Sprout Co., of 10 stamps, and all needful amalgamating apparatus, will start up in about six weeks. We may then expect to hear of big results. The Kearsarge mill, also having 10 stamps, will go into operation shortly. Large lots of excellent ore are out and in readiness for crushing, at the dumps of both the Kearsarge and Silver Sprout mines.

## Kern County.

Havilah *Courier*, June 8th: Mr. McKead-

ney is building a new quartz mill on the west side of Copperas Branch.

## Mariposa County.

*Mail*, June 15th: Messrs. Coleman & Scanton have been working a quartz mine in Ned's Gulch, a tributary of the Merced river, with good success; they run one arastra with water power. Mr. Scanton has sold his interest to Phil. Dougherty, of Hite's Cove.

A correspondent of the *Alta* of this city, says: In the Princeton mine, there are thousands of tons of \$20 rock in sight. The Pine Tree and Josephine mines are scarcely inferior to the Princeton. These, with the Mariposa mine, are all standing idle. Mr. Brumagim is putting up a Lundgren crusher, and a Ryerson amalgamator in the Bear Valley mill. He expects to have them in operation in a few weeks.

## Nevada County.

*Transcript*, June 14th: About 40 men are now employed on the Jim ledge, and the mill is kept in constant operation. The snow which interfered with its working during the winter, is still some six or seven ft. deep in places.

Young & Black, at Eureka, employ some 30 men. Rock is yielding handsomely.

On the South Fork of the Yuba, some miners have surveyed and laid out a town which they have designated Guntown. Several hundred men are prospecting in the locality, and it is said the ledges look first rate.

Two new mills, one for working quartz, and the other cement, are being erected in the vicinity of Eureka. It is said that a number of Grass Valley and Birchville men have become interested in the development of extensive cement mines in this locality.

The Birchville Co., whose claim is located near Eureka, have been offered \$30,000 for a controlling interest in their mine.

A new town has been located on the Middle Yuba river, seven miles below Moore's Flat, called Yubaville. It is said to have five quartz ledges to build it up, and a large number of confident prospectors.

A cave occurred in the claim of Stidger, Mull & Co., at Buckeye Hill, Bridgeport township, by which Jack Dempson was seriously injured, on Wednesday night last.

June 15th: Ten tons of rock from a ledge owned by Kistle & Co., Myer's Ravine, has been worked at Palmer's mill, and yielded \$25.25 per ton. The ledge is three ft. thick, and has been opened to the depth of 60 ft. below the surface. The test just made proves its value, and a large lot of rock will be taken out for another crushing.

June 16th: The Evans & Stidger claims, at Buckeye Hill, Bridgeport township, made a clean up this week, from which a dividend was declared in the sum of \$10,000.

The Granite Tunnel Co. also made a large clean-up this week of \$8,000 or \$10,000. The exact amount is not yet known.

The Don José Co., at Birchville, recently leased their bedrock to H. Loy & Co., for three years for the sum of \$7,000.

A 5-stamp mill has been erected on the Grizzly ledge. Rock from the lower tunnel paid \$70 per ton. The ledge is wide, and there is every facility for working it to a great depth. The mill is crushing eight tons per day.

A ledge discovered about a year ago by a French company, has been sunk 30 ft. where a 5-ft. ledge of rich quartz was found. The rock is ribboned, and fine gold is thickly distributed throughout. The owners intend to erect an arastra for working the rock.

An old channel of the Yuba has been found at Bald Hill, near Eureka, the bed of which consists of a cement very rich in coarse gold.

*Gazette*, June 13th: The Fidelity ledge, near the Tecumseh mill, is soon to be worked again. A large amount of the rock crushed at the Tecumseh mill with fair returns.

June 14th: In the south drift of the Jim ledge, a four ft. vein has been struck, with richer rock than ever before taken from this mine. A rich chute has been struck in the Birchville tunnel. The rock is spotted and seams with gold. Arrangements have been made for working a hundred or more tons of rock at the Black & Young mill.

June 18th: The Mount Zion Gravel Co., near Snow Point, have recently struck a basin of rich gravel in their tunnel. The Kentucky Co. on the same ridge, have commenced putting up their pumping machinery, and will soon have it running.

*National*, June 12th: The tunnel on the Yellow Jacket ledge is now in several hundred feet. The dirt coming from the tunnel looks well. The Home Ticket ledge is taking out some beautiful specimen, containing free gold and sulphurets in abundance.

EXCELSIOR.—Meadow Lake *Sun*, June 15th: The shaft on the Shooting Star ledge is 40 ft. deep; the ledge is four feet wide.

The company intend to sink 100 ft., and then drift along the ledge.

The Green Emigrant Co. are sending to the surface a large quantity of splendid ore. The Excelsior Co. are remodeling their mill. At a Trustee's meeting of the Kentucky Co., an assessment of \$2 per share was levied. Work will be immediately commenced upon the ledge.

Grass Valley *Union*, June 12th: The owners of the Lightfoot claims, at a late meeting agreed to incorporate, and immediately commenced work on their ledge. The Green Emigrant is yielding \$50 rock. A Mr. Moore is about to put up a concentrator of a new pattern, at the Mohawk mill, which is supposed to be superior to any now in use.

The California Co. are taking some splendid rock from their ledge, much of which shows free gold.

## Placer County.

Dutch Flat *Enquirer*, June 15th: From developments made during the winter, enough has been discovered to warrant the statement that rich gravel deposits exist immediately above the Dutch Flat branch of the Yuba ditch, near Camp No. 2. The gravel, mixed with debris lying on and below the rim, has been washed away, exposing a quartz gravel deposit which prospects well. Into this a tunnel is now being run. The gravel looks well, and appears to be from six to eight ft. deep, in which is superposed a deep stratum of pipe clay, making drift diggings. The washings yielded well. Below the ditch, also, gravel prospects have been found.

June 9th: The first run of the cement mill put up by the King Bros., far exceeded their most sanguine expectations. Less interruption was experienced from the working of the new machinery, and the dirt crushed yielded more than was anticipated.

Sacramento *Union*, June 10th: Coffey, Rison and others, of San Francisco, are about to establish smelting works in Placer county, a few miles from Clipper Gap. Iron ore is said to be abundant in that locality.

## Plumas County.

*National*, June 15th: The new mill of Light & Bro., Genesee Valley, cost \$5,000. At the present rate of working, it will pay for itself in four or five weeks.

Quincy *Union*, June 15th: During the past two weeks, several slugs from 36 down to four ozs., have been found by Bolger & Co. in their claims in French Ravine, near Rich Bar. The Crescent Co., for one week's run, cleaned up on Saturday last \$3,300, and the Whitney mill paid \$2,500 for one week's crushing. The Eagle Co., at Sawpit, cleaned up on the 11th inst., 537 ozs. of gold, for 24 hours' washing of their pay dirt.

## Sacramento County.

Folsom *Telegraph*, June 15th: A chunk of quartz gold, about the size of a man's fist, weighing between four and five ozs., and valued at about \$75, was picked up between Alder Creek and Prairie City last week by Miss Glindkamp.

## Santa Clara County.

The San José *Patriot* says that an exceedingly rich mine of cinnabar has been discovered on the ranch of Chapman, 3½ miles south of San José. There is a solid ledge about 12 ft. wide and eight ft. thick between walls of rock, which grows richer as the excavators descend upon it. They have gone down on the ledge about 150 ft. The ore is being worked at the Guadalupe mine.

## Shasta County.

*Courier*, June 8th: Work will be immediately resumed on the Chicago claim. The last shipment of Chicago rock averaged \$268 per ton. Work on the Red Warrior is progressing finely. The lode is wide, well defined, and prospects rich in gold and silver.

June 15th: Mr. Jones, of San Francisco, an experienced quartz miner, visited the Potosi mine last week, with a view of purchasing the mine, machinery, etc. He expressed himself well satisfied with the mine, and will probably become its owner.

Times are dull at South Fork at present. The great excitement and rush predicted a few months ago, has failed to come off. We regard the mines as good, and think that in time they will yield handsome incomes to their owners.

The work of rebuilding the Mammoth mill, at Quartz Hill, is progressing satisfactorily. It will be in running order about the middle of next month. No more rock can be taken from the shaft until it can be cleared of water by means of a pump propelled by steam power. It is estimated that there is enough paying ore already taken out to pay the expense of removing and putting up the mill.

## Sierra County.

Yreka *Union*, June 15th: The Black Bear ledge is at this time one of the best paying ledges in the State, with every indication that it will continue its present yield an indefinite period. The mill has 12 stamps,

run by water power, and is situated three miles from the ledge. The greatest depth yet reached on the ledge is 300 ft. The ledge varies in thickness from two to 25 ft., and the rock yields from a few dollars per ton to several hundreds of dollars; that worked by the present company has averaged \$18 per ton.

The Union mill is lying idle. The Yellow Jacket, an extension of the Black Bear, is being prospected, with flattering results. The Uncle Sam is also being prospected with good results.

## Sierra County.

Downieville *Advocate*, June 15th: A rich discovery has recently been made near the Sierra Buttes, which far surpasses anything of recent date. The appearance of the rock indicates it to be fabulously rich—free gold being visible in all of it—and specimen pieces containing as much gold as quartz.

Messrs. Green, Martin and others, of San Francisco, have purchased the Blue Tunnel, at Alleghany.

## Yuba County.

Marysville *Appeal*, June 19th: The Donnebroke mill is running on quartz from the Rare Ripe claim; and while they are pumping water from their own claim, receive a supply for their battery from the Rattlesnake company.

## ARIZONA.

San Bernardino *Guardian*, June 15th: Capt. Chapman has completed his equipments for hauling quartz from the Vulture mine to the mill at Wickenburg. Five very heavy wagons have been built. They are of huge proportions, iron being freely used. They were to leave Los Angeles for this place last Wednesday.

## BRITISH COLUMBIA.

From the Cariboo *Sentinel*, May 16th: About 200 Chinamen are engaged in mining on the North Fork of Quesnel.

About 14 men are at work on Cunningham Creek, most of them prospecting.

At a meeting of the directors of the Williams' Creek Bed Rock Flume Co., it was determined to prosecute work without delay. A number of workmen are engaged to clean out the flume, and prepare for the freshet.

May 20th: The Davis Co., Williams' Creek, washed up in one week 300 ozs. Nevada Co. washed up 100 ozs. out of a little dirt taken from the edge of a channel they are trying to bottom. The United Co., Conklin's Gulch, washed up lately 200 ozs.

Discovery Co., Grouse Creek, washed up for three days 100 ozs. The dividends of this company for three months subsequent to 1st Nov., have averaged \$240 to \$500 per share weekly. Black Hawk Co., from two days work, washed up 80 ozs.

At Lowhee Creek, the companies are all at work sinking shafts, and running tunnels.

It is said that 25 cts. to the pan can be got in decomposed rock, taken from the Stewart ledge, Cañon Creek, at a depth of 60 ft.

Black Hawk Co., at Big Bend, took out of one wheelbarrow of dirt, \$100. The Dart & Pond Co. took out of their shaft at a depth of 42 ft., 13 ozs. The Jones Co. worked all winter, and took out \$5 per day to the hand.

## COLORADO.

From the *Times*, May 28th: The following is the result of several workings by the Phelps process:

	Stamp Mill.	Phelps' Process
Adeline ore .....	\$60	\$180 per cord.
200 lbs. Pewabic ore .....	20	3 1/2
400 lbs. Foot & Simmons .....	70	250

The furnace was imperfect in many particulars, yet the ore was put through at the rate of half a ton an hour.

The following are the week's transactions in mining property. S. Harsh et al to Marcus Walker and C. L. Cornish of New York, 800 ft. on the Mountain lode, Illinois Central Dist., and 400 ft. on the Cross lode, for \$85,000; also S. Harsh et al to above named parties, certain claims on the Stabbs and Eckla lodes, Gilpin county, for \$35,000.

Denver *News*, May 29th: Eight lbs. of ore from the Watertown lode, yielded 13½ ozs. of silver, valued at \$17.50 in coin, or over \$4,000 per ton. Several assays by Dr. Johnson, of ore from this lode have averaged \$4,500 per ton. Maj. Anderson intends to begin work on the lode immediately. Messrs. Colb & Fry have bought a quarter interest in Knapp's Gulch claims for \$1,500.

The editor saw a gold bar weighing 6.05 ozs., coin value, \$120.34, the result of 36 hours work of two men in the old Spanish diggings, on the Bayand ranch.

## IDAHO.

From the *World*, June 1st: Mining at Granite Creek is quite lively. Paul, Flynn & Co., after a two week's run, cleaned up 137 lbs. of amalgam, which retorted \$25,552. Maj. Flynn took out a nugget weighing 4½ lbs., worth \$850. The Major thinks he has struck the mother lode of the camp.

At Lemhi, excitements are the order of

the day, yet nothing remarkably rich is reported. A rich quartz camp, silver, is said to have been struck within 40 miles of Lemhi. All business is done on trust—there are hundreds of men at this place hard up for grub.

June 5th: An experienced miner writing from Lemhi to J. W. Woods & Co., Idaho City, says: We have tried the ground pretty fairly, and feel quite discouraged. Some say that there is plenty of \$25 claims here. If there are, it will have to be proved after this. A great many are leaving here. Some of them had claims from which they expected good wages, but they did not pay for working.

A new ledge, two ft. wide, prospecting finely, is said to have been lately discovered on Pine Hill, Rocky Bar Dist.

Owyhee *Adelunche*, June 8th: The Morning Star mill has been at work for three weeks on Oro Fluo ore. The shaft is down 12 ft., and shows ore yellow with gold. Arrangements have been made with the Lincoln mill to crush Woodstock ore.

Blue and Jacob's Gulches are rich in placer gold. Bell & Co's claims have pay dirt from top to bedrock, 10 ft. Specimens of from one to 15 lbs. are picked up in the sluices. Other claims are paying handsomely.

The Webfoot mill is at work on ore from the New York mine.

Plynn, just arrived from Lemhi, says many are leaving who never washed a pan of dirt, nor saw one washed while in the mines, and that all unfavorable reports come from that class.

#### MONTANA.

From the *Post*, June 1st: Hiffner & McCaa, Highland Gulch, are taking out from \$1,000 to \$1,500 per day, to one set of sluices. Green Campbell, on Horse Gulch, with four men, averages \$400 to \$600 per day. Cooley & Co., on Dry Gulch, made a run of \$1,000, with three sets of sluices.

George Caruany on the main Highland Gulch, is taking out from \$100 to \$200 per day. Lewis and Marshall average about the same.

Maj. Packard lately found a nugget weighing \$347. Another found by Green Campbell, weighed \$200, and another found by John Harrington, weighed \$289. Several more weighing from \$50 to \$100 have been found.

The following names and figures indicate the leads, depth of shafts, width of crevice, and yield per ton on the leads crushed by the Alpha mill: Poney, 200 ft., 18 in. crevice, \$85; Galena, 75 ft., 20 in. crevice, \$40; Boaz, 70 ft., 24 in. crevice, \$80; Last Chance, 20 ft., 14 in. crevice, \$40; Blue, 35 ft., 24 in. crevice, \$40; Asop, 75 ft., 20 in. crevice, \$25; Gold Hill, 60 ft., surface rock yielded \$10.

The Casket silver lead near Beavertown, is turning out galena as rich as the Gregory. A rich strike has been made in copper ore at Copper Gulch. Flakes of this copper were panned out in this gulch last summer. Two companies have located, and last Friday one of them, after running in 24 ft., struck into what has proven to be an almost solid lead of copper.

On Cooley's Gulch, from \$500 to \$1,050 for one day's run, is not an unusual yield.

A silver brick is on exhibition in the assay office of Bohm & Molitor, weighing 336 ozs., 18 grs. of the fineness .845, and valued at \$5,697.61. This and a similar bar, are the result of the past two summers work of a ranchman.

#### NEVADA.

##### Black Rock.

From the *Trepass*, June 15th: An invoice of ore from the Black Rock mines, recently worked at the Eagle mill, only paid expenses for crushing, yet the tailings assayed treble the amount obtained from the ore. The ore is intractable, and cannot be worked to advantage by any known process, owing to the presence of lead, antimony, sulphurets, etc., which it contains. Several sacks have been sent to Freiberg for reduction. Meanwhile work has been nearly suspended.

##### Reese River.

From the *Reveille*, June 7th: In the Buckeye ledge, specimens containing the glittering metals are often met with. Large quantities of ore have been mined. Several tons of ore worked at the Austin mills, have produced upwards of \$100 per ton.

Several veins have been found in Summit Cañon, among them the Canada. Several tons of the ore from which have produced near \$1,000 per ton.

Twenty-three tons of ore from the Cortez Dist., now at the Keystone mill, contain considerable quantities of the newly discovered mineral *stefefeldite*. The ore is rich in chloride and black sulphurets, in some pieces the two are combined. The ore should yield \$300 per ton.

The St. Louis claim has been purchased by capitalists who are familiar with its character, and they intend to develop its treasure.

Silver Bend *Reporter*, June 8th: The mill at Hot Creek will be set in motion as soon as brick can be furnished, and furnaces erected for smelting the ore. Work progresses on the Indian Jim ledge, Hot Creek Cañon, and several mines near Rattlesnake Cañon. About 80 tons of ore lies upon the dump of the Gazelle.

An inferior article of coal, supposed to be anthracite, has been discovered near Austin.

Seven thousand ozs. of bullion reduced from ore from the Liberty mine, San Antonio Dist., by the Rigby mill, has been forwarded to Austin. D. S. Child has sold his interest in the Silver Bend Co. on the Transylvania ledge, to W. P. Pritchard and Mr. P. M. Elder—reported consideration \$100,000.

*Trepass*, June 14th: A mill lately erected in Gold Cañon for working corralled sulphurets, has been christened the Pappoose.

June 15th: Some very rich specimens of ore from the Diana claim, is on exhibition at Austin, which is supposed will assay into the thousands.

*Enterprise*, June 11th: Miller and Ripley's fast freight lately arrived in Austin, with \$17,778.81 from the mill of the Manhattan Mining Co.

##### Emerald.

*Enterprise*, June 13th: On the Hamilton claim an incline 50 ft. deep has been sunk where some very fine ore is found. The ledge has been struck 100 ft. below the croppings by a tunnel 60 ft. in length. The rock taken out shows an abundance of free gold.

Some rock from the Imperial mine has been assayed by Weigand of Gold Hill, yielding \$630 per ton, gold and silver.

On the Deposit No. 3, a tunnel has been run in 80 ft. It is expected that the ledge will be struck at a further distance of 20 ft., within a week, about 60 ft. below the surface. Four thousand five hundred lbs. of the croppings, worked in Peurod & Wheeler's arastra, yielded \$75 gold per ton, \$18.60 fine.

A three ft. ledge has been discovered in the U. S. Grant mine, at the back end of a tunnel 40 ft. in length, containing both gold and silver.

The Poorman lead is very rich in coarse gold. The solid quartz from which rare specimens were taken, was found one foot from the surface.

The Black Republican ledge is at least 30 ft. wide. Work is to be immediately commenced on it.

On the 21st of March, Charles Frink sold Wm. Wilson an undivided interest in 175 ft. of four claims near the Wilson ledge, for \$983.

*Union*, June 15th: The long tunnel of the Wilson Co. is in 640 ft.; the short one, 100 ft., with drifts east and west. The Wheeler Co. are running a tunnel, and taking ore out of the shaft. The Hamilton, Forrest, Deposit and Nevada Cos are running tunnels. Morning Star, Rives Nos. 1 and 2, Imperial, Yellow Jacket, Confidence and Empire are sinking shafts or drifting. Several companies are at work on the Vanderbilt ledge.

[In the Stock Circular, in another portion in this paper, will be found late mining news from this district.]

*Enterprise*, June 11th: A body of ore has been cut in the Savage mine, 75 ft. east of any deposit of paying ore yet found. The deposit is situated 200 ft. south of the Gould & Curry, on the 600 ft. level, and is very rich.

June 12th: The machinery for a large mill, weighing over 30 tons, has been bought by a Boston company, and shipped to Newark Dist. The mill will be furnished with the Greeley pans. The bottoms of the settlers are 7½ ft. in diameter; each pan bottom weighs 1,600 lbs. At the Gold Hill Foundry, a battery is being constructed for the Petaluma mill, of which each mortar will weigh 4,000 lbs. For the same mill they are also making a fire front that will weigh 4,000 lbs.

The Overman mine is turning out some fine black sulphurets, specimens of which are on exhibition at Rubling & Co's assay office.

June 13th: The Gold Hill Q. M. & M. Co., have declared a dividend of \$375 per ft.

June 15th: Mr. Haskell intends erecting one of his furnaces in Galena, near Spring Valley, Washoe county. The ores to be worked will be taken from the Alford and Orizaba mines.

Wells, Fargo & Co. shipped during the last week, 11,009 lbs. of bullion, valued at \$117,270.87.

#### OREGON.

From the Jacksonville *Press*, June 8th: The news from Wine's camp, on Jump-off Jo, is in every respect gratifying. Mr.

Wines and partner, after a run of a day and a half, cleaned up \$80. Their claim averages \$12 per day to the hand.

*Sentinel*, June 8th: Rich diggings have been struck on the left hand fork of Jackass creek, some distance higher up than heretofore. About 20 claims have been staked off. The yield is large and for the most part coarse gold. New diggings are being struck almost every week.

#### UTAH.

*Edette*, June 8th: At the store of Beaman & Co. there is a large number of specimens of gold, silver and copper quartz, from Bingham Cañon. Native silver and copper were visible to the naked eye. A. D. Heaton, a gentleman residing at the cañon, has some specimens of copper yielding 95 per cent. of metal. He has also a pennyweight of coarse gold, the result of one pan of dirt. Mr. Molitor, of the firm of Bolme & Molitor, assayers, proposes to visit this camp.

We know that minerals abound here as well as all around us. Coal, iron, lead and copper abound. These are recognized by the Mormons, even. Petroleum springs are known to exist, and there is salt enough here to season the world. Gold and silver are known to exist in different parts of the Territory, in quantities sufficiently rich to pay to work those class of mines. But gold and silver mining are greatly discouraged by the leaders of the Mormon Church in Utah.

OCEAN STEAMING.—Long ocean voyages, altogether by steam and without stopping, is a new experiment in commercial enterprise; but the success which has thus far attended them is highly encouraging for the future. The Panama and New Zealand line is a greater undertaking, in length of voyage, than the San Francisco and China and Japan enterprise, although not attended with so much or such a world-wide importance. Those steamers have now made sixteen trips, all within their schedule time, thus fully establishing the practicability of the service. They run 7,750 miles without stopping, against 4,800—the distance from this port to Yokohama, the first stopping place on the China route. The average speed of the New Zealand steamers, in their sixteen trips, is set down at 242 miles per day. The last return trip of the Colorado was made at the average rate of 238 miles per day.

It is but a few years since such voyages as these were pronounced impracticable, and the Pacific Ocean, except for coasting trade, was considered closed against steam traffic. Improvements in the construction of sea-going steamers and in marine engines have already made that prediction a false one, and the future is most promising for still greater improvements in the same direction. A successful solution of the problem of the economical application of petroleum for steam fuel would work a commercial revolution scarcely inferior in its consequences to the original introduction of steam into navigation. The importance of such a result to California will be the stimulus which will put experiment in that direction to the utmost limit of human possibilities.

BOSTON NOTIONS.—The project of uniting Boston with East Boston by a submarine way, like the Thames tunnel, is being seriously talked off. It is proposed to have it wide enough for a railway, carriage way and foot way. Another Boston notion is the union with the city proper of all the suburban towns for tea or twelve miles around the "hub." It has already encircled within its folds the pretty and historic precinct of Charlestown—Bunker Hill and all, and at latest accounts it had pretty much accomplished the same feat for Roxbury. By the accession of the latter place, Boston will add over 30,000 to its population in a single day.

FOREST GROWTH ON THE PRAIRIES.—As an evidence of the capacities of the western prairies to produce timber, it is said that in Cedar county, Iowa, there is a young forest of a thousand pine trees, in clusters and avenues, where, eight years ago, nothing grew but wild prairie grass. A young man there can be rich in twenty years by planting pine trees to cut for saw logs.

#### COAL DISCOVERY NEAR NEW YORK CITY.

An extensive bed of coal, similar to that obtained from Mount Diablo, in this State, has recently been discovered in Middlesex county, N. J., only twenty miles from the city of New York. It is estimated that 4,000 tons of marketable coal can be taken from one acre of land, and delivered in New York at \$3 per ton. Thirty thousand acres have been leased by a single company, which it is thought will yield an aggregate of eight millions of tons. The recent coal developments in this State render it altogether probable that coal of an inferior though passable quality, will yet be found in large quantities, where its existence has heretofore been considered impossible, according to the past theories of science.

## Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.  
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

**Terms of Subscription:**  
One copy, per annum, in advance, \$5 00  
One copy, six months, in advance, 3 00  
For sale by Carriers and Newsdealers.

Writers should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

## Canvassing Agents.

Mr. A. C. Knox, is our elly soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1886.  
Mr. E. W. Pelton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1886.

Mr. S. D. Whitaker is our duly authorized traveling agent. June, 1887.

Mr. C. A. Wetmore is an authorized agent for this paper.

## Agent Wanted!

A FIRST CLASS CANVASSING AGENT (none other need apply) can secure permanent employment and make \$50 per week and expenses, or better, by applying to DEWEY & CO., Mining and Scientific Press Office, 505 Clay street.

## San Francisco:

Saturday Morning, June 22, 1867.

## Notices to Correspondents.

ONE INTERESTED draws attention to the following "astounding statistics." The Hale & Norcross Company have for nearly twelve months been carefully making assays of the ores sent to the various mills, and have discovered that, on the average, only 65 per cent. of the actual assay is returned to the company in the form of bullion. This, our correspondent contends, would, on an annual return of bullion to the extent of \$15,000,000, prove that a waste is incurred equal to \$8,076,923 per annum, or at the rate of 35 per cent. on the actual bullion mined, or 53½ per cent. on the bullion saved, which, as this calculation is based on the returns of a company who appear to have a tolerably sharp eye on their interests, would probably be increased if returns from all the mines of Nevada were aggregated to not less than 60 per cent. on the amount of bullion annually beneficiated, or a total annual loss to the Nevada mining stockholders alone amounting to not less than nine million dollars per annum. The preceding supposition is corroborated by the accounts published by the Hale & Norcross Company, by which it is shown that out of ores assaying \$1,288,132, only \$810,977 of bullion was returned, thus losing \$471,155, or sufficient, if the whole had been realized; to have furnished to the stockholders a bonus, at the end of six months, of \$1,178 per foot on 400 feet, or nearly equal to \$200 per foot per month, in addition to the dividends paid to the stockholders. Our correspondent concludes by asking when will such a disgraceful statement of wastefulness be tamely submitted to by stockholders without any practical attempt being made to remedy the evil by superior management.

ALLEMAGNE.—Gunpowder has erroneously been assigned as the invention of Bartholomew Schwartz, a German monk, about the year 1320. Royer, or Friar Bacon as he is more commonly called, in consequence of his being a San Franciscan monk, is undoubtedly the earliest authentic writer on the properties of gunpowder. Somewhere between the years 1240 and 1250, he wrote a treatise on the subject containing the following passages: "From saltpetre and other ingredients we are able to form a fire which will burn to any distance." "A small portion of matter, about the size of the thumb, properly disposed, will make a tremendous sound and commuscation, by which cities and armies may be destroyed." An enigmatical passage occurs in the same work, which is generally supposed to describe the mode of preparation: "Sed tamen salis petre, lurn move cap ubre, et sulphuris, et sic facies, toutitrum si scias artificium." The words in italics are supposed to form the anagram *carbonum pulvere*. The first word, *lurn*, however, is questionable, and may perhaps be a technical abbreviation. Hallam states, on the authority of an Arabic manuscript found in the Escorial, that little room exists for doubt that gunpowder was introduced into Europe by the Saracens about the year 1450, though its use in warfare more resembled fireworks than artillery. Many authorities might be found to show that gunpowder was in comparatively common use early in the fourteenth century. Edward the Third of England employed artillery, with memorable effect, at the battle of Cressy, on the 26th of August, 1346.

## Petroleum as a Steam Generating Fuel.

We have already alluded, at considerable length, to the experiments which have lately been in progress on board the U. S. steamer Palos, for testing the practicability and economy of the substitution of petroleum for coal in generating steam—especially for sea-going steamers. The experiments, which have been for some time in progress, appear, according to telegraphic advices received during the past week, to have exceeded the most sanguine expectations of the engineers who have had them in charge. The speed attained is said to have been much greater than that obtained on the same boat by the use of coal, and at a much less cost. The result was deemed of sufficient importance to be made the subject of telegraph dispatches, both to this coast and to Europe.

In addition to the above facts, we understand that Capt. Eldridge, of the Pacific Mail Steamship Company, is also in receipt of private intelligence from his principals in New York, to the same effect as above. The Captain furthermore expresses his belief in the ultimate success of the enterprise, and gives it as his opinion, that in such an event, every steamer on this coast will be changed from coal to petroleum-burning boats within twelve months thereafter.

This brings us to another important phase in this matter, which is to call the attention of the public to the fact that Mr. J. H. White of this city, has been engaged for nearly three years, in experimenting with the same end in view. Without any knowledge of what was being done in Boston, he has devised an apparatus for hurrying oil, on the same principle as that on which the Eastern experiments appear to be based; but with a somewhat different mode of application. Mr. White has recently submitted his plan to several of our leading engineers and steamboat men, all of whom, we understand, are enthusiastic in their belief with regard to its success, and consider it a decided improvement over that described as employed on board the Palos. Mr. W. has made application for a patent for the same; and the probability is that we shall have the pleasure of witnessing a practical application of the same on board a steamer in this harbor, as soon as the necessary machinery can be got in readiness. The results of this discovery, if the anticipations of practical men are realized, can scarcely be estimated. In addition to the immense advantages which will accrue to ocean steam navigation, they will at once create a fair market for the immense quantity of heavy petroleum oils which are now running to waste from the natural oil springs on this coast, and which, at the present price of coal oil, cannot be successfully utilized.

Mr. W.'s plan contemplates an inexpensive preparation of the crude oils, by which their efficiency, hulk for bulk, will be materially increased; while at the same time, the only difficulty said to be encountered in the Eastern experiments, will be entirely removed—that is, the presence of free carbon, which tends to clog the feeding of the burners.

FOR WHITE RIVER.—Mr. John D. Carter has arrived from the East, and purposes reopening the works and mines of the Philadelphia Mining Company, at White River, Tulare county. Mr. Carter had the superintendence about a year ago, but was obliged to return East on account of sickness. He has great confidence that White River will prove a rich mining district. The new ten-stamp mill is in complete order, and some considerable mixed rock is out ready for crushing. The work will be proceeded with immediately.

MEXICO.—The total value of the real estate of Mexico is put down at \$1,355,000,000.

## "Wirbel-Bewegung?"

Don't be alarmed, dear reader; we have no evil design in placing the above terrible looking word at the head of a leading article. "What is it?" Well, that is just what we are going to explain, and why we have put it there. Wirbel-bewegung is— is smoke: it is air, water, wood, stone, iron, flesh and blood—everything, in short, is *wirbel-bewegung*! Professor Sir William Thompson, of Glasgow, has just found out this astounding fact, and announced it to the world through the Royal Society of Scotland! Wirbel-bewegung is, primarily, *motion* (of a peculiar kind); and smoke, air, water, wood, etc., is nothing but motion? Sir William Thompson says so.

Did the reader ever see a smoke ring thrown out from the mouth of a cannon and go off into the air, writhing and twisting until lost to view or dissipated by the breeze? Well, that is *wirbel-bewegung* made ocular to the weakest vision.

It has heretofore been supposed that what we call solid matter was ponderable and divisible, and that it was impossible to imagine a solid atom so small that it could not be cut in two; it might be dissipated into gases, but it would still have weight, form and divisibility. The least discoverable portion of matter has been termed a *molecule*; and a molecule has been supposed to be made up of numerous atoms, so small that a large number of them must be aggregated before they can be made visible by even the most powerful microscope. But a new theory has latterly obtained that solid matter is nothing more nor less than immaterial, imponderable force, or motion, *hammered* together, as it were, into solid masses! These immaterial "atoms," if we may be allowed the expression, are what Professor Thompson calls *wirbel-bewegung*. The term, *wirbel-bewegung*, however, did not originate with him; but, as its etymology would seem to indicate, it has a Teutonic origin. It has been applied by Helmholtz to a peculiar movement involved in his law of "vortex motion" in a perfectly elastic fluid. The term, as originally used, means whirl-motion. Prof. Thompson takes the matter up where his predecessor left it, and boldly asserts that Helmholtz' rings or modes of motion constitute the ultimates, or rather the beginnings, of matter—that they are the only true atoms.

If we heat a rod of iron red hot, it increases in length; hence its component atoms have the power of motion. By the new doctrine of "Heat a Mode of Motion," it can be proven that heat, in a solid body, is nothing but motion; and as heat and cold are merely relative conditions, the atoms of all bodies must be constantly in a state of motion. What that motion is, or what those atoms are, is, as yet, a mere matter of assumption. Prof. Thompson holds, as above, that the atoms of matter are merely the development of a series of forces, similar to the *wirbel-bewegung*, or whirl-motion, and that the universe is thus built up of laws, rather than material substance.

The Professor illustrated his idea in the following novel manner: "He first set before the audience a long box filled with smoke, with a very small round hole in one end and a larger one in the other end. He then took a piece of thin board and slapped it against the larger opening, when a puff of smoke, in the form of a "smoke ring," shot through the opposite hole, and moved upwards in the room. A large number of these rings were rapidly thrown off, and as they floated about the room, were frequently seen to strike against one another and bound off, with a trembling action. Had these rings been formed of a perfect fluid, and had they moved in another perfect fluid, absolutely free of viscosity, according to the Professor's ideas, and according to all true philosophy, they would have kept up their *wirbel-bewegung* motion to all eter-

nity, for there would have been no friction to retard the same."

The Professor held that if two such vortex atoms should become interlinked, nothing could ever separate them; for one line of vortex motion could never pass through another line. Thus such a double molecule might much vary in shape, yet remain essentially the same. Here, then, claimed the Professor, is a new basis for all physical science!

That there is a perfect fluid, in which bodies move as in a vacuum, is sufficiently proven in the phenomena of the vibratory motion of light through space. That the matter filling space is a perfect fluid, entirely free from viscosity, is evident from the fact that the world has rolled through it for millions of years without any retardation—at least not a second of time has been lost in 3,000 years, as is proved by mathematical demonstrations.

The grand discovery of the conservation of force seems to have brought mankind into a condition to receive with much favor even such a novel theory as the one here set forth with regard to the etheriality of matter. The idea that the molecules of solid matter are hard atoms, is in a fair way to be expunged from our text books, for the new theory that matter is no matter at all, but merely the result of certain forces, or motions, or *wirbel-bewegungen*, emanating from points; and that the universe is built up out of these airy nothings, something as the solid ice is produced from the invisible steam, simply by the extraction of heat.

Did not Sir Isaac Newton have a dim perception of this thing when he said: "Matter is an aggregation of the smallest parts, which are material and extended, and which, by an *unknown power*, are strongly connected with each other." This "unknown power," that great philosopher said: in his treatise on optics, "is the business of experimental philosophy to find out." Sir Isaac, as we now learn, made a mistake in claiming *materiality* for the ultimates, which, of themselves, constitute the "unknown power" which he left for posterity to "find out," and which his countryman has now discovered to be nothing more nor less than the *wirbel-bewegung* of Helmholtz.

Cowper, by this reasoning, also unwittingly uttered a greater truth than he was aware of when he said:

"By ceaseless action [motion] all that is subsists."

A GEOLOGICAL SURVEY OF SOUTHERN NEVADA.—Prof. Gabb, who has recently returned from a geological reconnaissance of Lower California, started on Thursday last, at the head of a party of five or six persons, to make a similar survey of south and southwestern Nevada, including the Pahranaagat district. This portion of the State of Nevada is almost a *terra incognita*, and yet there is very good reason to believe that it contains much mineral wealth. It would be difficult to select a more suitable person to head such a party; and we have the utmost confidence that a large amount of valuable, practical information will be collected by Mr. Gabb and his party. We shall await with much interest any public report which he may make of his researches in that interesting portion of our neighboring State.

SANTA CLARA COLLEGE.—We acknowledge the reception of an invitation to be present at the approaching annual exhibition of the Santa Clara College, Santa Clara, which will take place on the 25th and 26th instants. The exhibitions of this College are always attended with rare interest.

THE MORNING STAR COMPANY, in the Great Mogul District, Alpine County, are now running their north drift, which is in 300 feet from the main tunnel, and are in daily expectation of striking the second chimney—similar to that originally encountered in the tunnel. All appearances are favorable.

CONCENTRATOR DESCRIBED.—To the complete description of Hendy's improved patent concentrator, advertised to-day, we would direct the attention of all parties interested in that class of machinery.

ARMES & DALLAM,

215 and 217 Sacramento street.

SAN FRANCISCO.

IMPORTERS AND JOBBERS OF

WOODEN WARE,

Willow Ware,  
Feather Dusters,  
Baskets, in great variety,  
Clothes Wringers,  
Brushes, all kinds,  
Paper Bags, all sizes,  
Blacking,  
Ten Pins and Balis,  
Twines for all uses,  
Fish Hooks and Lines,  
Cordage,  
Broom Materials, Stationery, Bale Rope, etc., etc.

Having recently enlarged the capacity of our

PIONEER

WOODEN WARE MANUFACTORY,

To meet the demands of our rapidly increasing trade, we are now extensively engaged in manufacturing

Brooms,  
Brushes,  
Pails,  
Tubs,  
Keelers,  
Sieves,  
Churns,  
Fruit Boxes,  
Salt Boxes,  
Wash Boards,  
Cheese Hoops,  
Peach Baskets,

Butter Molds,  
Butter Tubs,  
Tar Buckets,  
Clothes Frames,  
Barrel and  
Half-bbl Covers,  
And many other articles in the Wooden Ware line, of very superior quality, which we offer to the trade at lower prices than the imported article commands in the market.

We are SOLE AGENTS for the sale of

SHERMAN'S

Improved Clothes Wringer

For the Pacific Coast.

We would call the attention of the trade to the superiority of

"ARMES' STAR EXTRA BROOMS,"

Being made from selected materials by the best workmen. They are unequalled for durability, fineness and beauty of workmanship. None genuine except those bearing a star and the fac-simile of the signature of C. W. & G. W. ARMES on the label. Trade mark secured. Parties ordering this Broom should specify "ARMES' STAR EXTRA," to insure their getting the genuine article.

Our customers can always rely upon having their orders promptly filled with goods of superior quality at the lowest market rates.

ARMES & DALLAM,

215 and 217 Sacramento street.

HINKLE & CAPP'S  
CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

The Centrifugal Ore Grinder.

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle involved is entirely novel. The grinding is effected by perpendicular millers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old millers and plates is as thorough and perfect as with new ones. The pulp enters readily between the millers and side dies, the pressure being light in front and heaviest at the heel of the miller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced, with the crushed ore, as these can readily pass each miller separately, without interfering with or affecting the other millers, each of which is independent, or can rest upon the bottom below the millers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each miller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the millers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The millers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "slimmer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, miller-hanger. F, miller plate or shoe. G, side dies. I, supporting lip. D, bearing surface. J, feeder. X, weight to counter-balance wear of miller plates, or shoes. U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of millers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that it, when fairly tried they fall to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six millers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of millers, about 5,000 lbs. Price, as above, completely fitted and ready for use, either way, \$500, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above or S. T. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circular. PHILIP HINKLE, and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco.

Greatest Invention of the Age.

BOWMAN'S

AMERICAN WASHING COMPOUND

And housewife's true friend, saves one-half the labor, one-half the time, and one-half the expense.

For WASHING CLOTHES, CLEANING HOUSES, REMOVING PAINT, GREASE, etc., it is unequalled.

It makes hard water as soft as rain water.

For sale at 15¢ per can of five gallons, at the manufactory, 128 Fifth street. Please send your orders, by mail or express, to

A. S. Hallidie & Co.,

MANUFACTURERS OF

FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is speeded and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—

very strong and durable—one third the weight of hemp of equal strength, (savings in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire

Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$  inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Ropes, Steel Wire Ropes, Hemp Ropes, and Chains.

Iron Wire Rope.		Steel Wire Rope.		Hemp Rope.		Chains.		Equivalent Strength.

BOOKS BY THE POUND.—During 1866, Great Britain exported, chiefly to the United States, over 5,000,000 pounds of books, valued at \$8,010,885 in gold, or an average of sixty cents per pound. These figures are taken from the custom house books. Before the war the cost of books, as sold in this country, was from thirty-five to forty cents per pound, and their cost now averages over sixty cents—rare and finely-printed books of course very greatly exceed this average.

JACOB SURW, Pioneer Photographer, 512 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

6v12-ly

**GUN COTTON IN THE MINES.**—The Virginia City Tresspass is informed by F. A. Tritle, Superintendent of the Belcher mine, Gold Hill, that he has of late been using gun cotton, for blasting purposes, in the mine. The drift where the cotton is being used is 800 feet from the surface; the air is very hot, and Mr. Tritle assures the Tresspass that he finds gun cotton to be much superior to powder, and for these reasons: it is less dangerous; the smoke caused by the explosion is neither offensive nor dense, and quickly clears from the drift; it does more execution, and it also costs less.

**DECAPITATION.**—The question whether the head retains sensibility after decapitation, has recently been pretty effectually settled in Paris, in the case of the execution of two Arab criminals. Every possible facility was offered for the examinations, which were conducted with all the appliances which science could suggest. Death was pronounced undoubted and instantaneous.

**MINT CHARGES.**—The mint charges, which, in ordinary lots, have heretofore been fourteen cents an ounce, are now reduced to eleven cents. The regular charges are as follows: Bullion under 300 parts gold, three cents per ounce; from 300½ to 600, five cents; from 600½ to 750, seven cents; from 750½ to 949½, eleven cents; and from 950 and above, no charge.

**THE MAHOGANY TREE IN INDIA.**—Dr. T. Anderson has reported to the British Government that great success has attended the introduction of the mahogany tree into the Calcutta Botanical Gardens. Several young trees brought from Jamaica and planted in 1795, were destroyed in the cyclone of 1864, after having attained an average size of twelve feet in girth at four feet from the ground.

A SMALL gold brick, valued at \$500, has been received in New Haven from the new mines near Morgantown, N. C.

**PEPPER.**—Pepper is an almost universal condiment. Black pepper irritates and inflames the coatings of the stomach. Red pepper does not, it excites but does not irritate, consequently it should be used instead of black pepper. It is known to the Romans and has been in use in the East Indies from time immemorial, as it corrects that flatulence which attends the large use of vegetable food. Persons in health do not need any pepper in their food. But to those of weak and languid stomach, it is manifold more healthful to use cayenne pepper at meals than any form of wine, brandy, or beer that can be named, because it stimulates without the reactions of sleepiness or debility.—[*Hall's Journal of Health.*]

**Piles! Piles! Piles!**  
NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men; but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of  
**WOOD'S SUB-POSITORY.**  
It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it. If you are troubled with the Piles—you will not be deceived in it.  
Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. ORISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Rush street, between Montgomery and Kearny.  
C. WOOD, Proprietor, No. 63 Tehama street, between First and Second. 2v14-3m

**THE PACIFIC IRON WORKS,**  
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern. Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greeno Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Important Notice.

Another New Doctor in the Field!

**DR. H. A. BENTON,**  
Has been performing many wonderful cures in this city the past two years, and, as his practice is fast increasing at the office, he finds it difficult to attend all the outside calls, and has concluded to invite R. H. OLMSTEAD, M.D., to join him. Dr. Olmstead, of Napa City, has been eighteen years successfully treating obstinate cases with water, electricity, and the magnetic forces. Remedies of the Eclectic School, of which he is a graduate, can be resorted to when needed. Being the seventh son of a celebrated physician, and at the same time having a powerful organization, his magnetic bands like magic dispel pain and disease. He is also a natural bone-setter. Dr. Olmstead has this day associated with Dr. H. A. Benton, the Medical Electrician and Homeopathist, at his office, 314 Bush street, San Francisco, who, having all the necessary facilities, such as the patent Electric, Chemical, Sulphur, Vapor, Hot Air and Medicated Baths, which aid in curing all curable diseases, whether acute or chronic, and with the combined skill, together with an excellent lady assistant, gives an assurance of cure to many, benefit to all, and injury to none.  
N. B.—Terms for treatment within reach of all. Office hours: from 9 A. M. to 3 P. M.; Sundays, by appointment.  
Lodging rooms convenient for those who come from the country.  
June 1st, 1887. 22v14-cow4t

**QUARTZ CRUSHER.**

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1886.  
**This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.**  
All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.  
Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

**FALKENAU & HANKS HAVE REMOVED THEIR OF-  
fice to 623 Montgomery street, opposite Montgomery  
Block, where they will receive orders for Chemicals of all  
descriptions, and for Assays and Analyses of Ores, Minerals,  
Metallurgical Products, Mineral Waters, Commercial Arti-  
cles, etc. Laboratory, corner of Center and Folsom streets,  
Mission. 21v14-1w**

EUROPEAN  
METALLURGICAL WORKS,

**Practical Mining School,**  
**Bryant Street, Between Third and Fourth,**  
SAN FRANCISCO.

**THE PROPRIETORS are at all times prepared to work or test**  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuretted, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

## A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance money upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.

## New Mining Advertisements.

**Chalk Mountain Blue Gravel Company.**—Location of Works: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of June, 1867, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 641 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.  
Office, No. 5 Government House, corner Washington and Sansome streets, San Francisco, California. j22

**Corallera Gold and Silver Mining Company.**

Chihuahua, Mexico Mining District, Mexico.  
Notice.—There is delinquent, upon the following described stock, on account of assessment levied on the twenty-seventh day of April, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of May, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Badger & Chapman, Kearny street, corner of California street, San Francisco, on Monday, the eighth day of July, 1867, at the hour of 1 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN HANSKOM, Secretary.  
Office, at the Alma Iron Works, Fremont street, between Howard and Folsom, San Francisco. Office hours: from 8 A. M. to 12 M. j22

**I. X. L. Gold and Silver Mining Company.**

Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of June, 1867, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, in the store of J. G. Hodges & Co., 418 and 420 Clay street, San Francisco, Cal., or to John G. Hodges, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

FRANK H. HAMILTON, Jr., Secretary.  
Office, 418 and 420 Clay street, San Francisco. j22

**Lady Bell Copper Mining Company.**

Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of June, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

B. P. WILKINS, Secretary pro tem.  
Office, 311 Market street, San Francisco, Cal. j22

**Important to Californians.**—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

**Naestra Secora de Gandelope Silver Mining**

Company. Location at Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twentieth day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of July, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOEL F. LIGHTNER, Secretary.  
Office, No. 60 Exchange Building, San Francisco. j21

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,  
1st St. San Francisco.

## FOR SALE!

PATENT RIGHT OF  
HUNT'S WINDMILL for the  
State of California or the whole  
Pacific coast.

This Mill is superior to any  
other, can be built cheaper, and  
is more durable.  
Full sets of patterns for four  
sizes Self-Regulating Mills, and  
three sizes of Adjustable Mills,  
will be sold with the right.  
This Windmill has been extensively  
advertised all over this coast,  
and is favorably known.  
Apply to

E. O. HUNT,  
28 SECOND STREET,  
11v24 San Francisco.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER,

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphur, tailings, cement, manganese, charcoal, sand, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

11v14-3m JAMES HITCHENS.

## NELSON &amp; DOBLE,

AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files,  
Etc., Shear, Spring, German, Plow, Blister and Toe Calk  
Steel manufacturers of

Mill Picks, Sledges, Hammers, Picks,  
Stone Cutters, Blacksmiths' and Horse-Shoers' Tools,  
319 and 321 Pine Street,  
Between Montgomery and Sansone, San Francisco.

## SAN FRANCISCO BRUSH FACTORY,

No. 211 California st., manufactures to order all kinds of  
BRUSHES.

At lower prices than cost of Eastern importation. Brushes  
for all classes of machinery. A superior Scrubbing Brush  
from Soap Root fiber; also, Sluice Brushes from the same  
material. The Patent Ratum, Street, stable, Plow and  
Plow Brush, for which they have the exclusive right  
for the Pacific Coast.

All orders from the interior promptly executed.  
FELDMAN, SIMPSON & CO.,  
10v14qr. Proprietors.

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, including freight, \$600  
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... \$850  
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied directly to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F which can be regulated at pleasure, and to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED OERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st No. 10, 1886, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1886.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886. BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

## Hooker's Patent Pump Valve.

A. A. A. are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber facia, which is secured to the bottom of the Valve by a washered screw, the design of which is seen in the Valve by the advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is increased at small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve are for sale by V. CUSHING, 120 Front street, San Francisco. These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public. See illustration and description of this Pump, published every other week in this paper 14v14qr

These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public. See illustration and description of this Pump, published every other week in this paper 14v14qr

LEFFEL'S  
American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REPRESENTATIVES—E. Stetson, E. Simons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. V. McMillan, Lexington, Santa Clara County. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

## Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

NITRO-GLYCERINE IN BLASTING.—A correspondent of the Nevada Gazette, who has recently visited the summit tunnel on the Central Pacific Railroad, writes that the contractor thinks they are going ahead with the tunnel fully twenty-five per cent. faster by the use of nitro-glycerine than they could by using powder. The small holes required for the oil can probably be drilled in less than one-third the time required for the larger ones necessary in using powder. The oil does much more execution than powder, as it always breaks the rock from two to sixteen inches beyond the hole, and also throws out a much larger body. The oil, in hard rock, shows a strength five times greater than powder, pound for pound. It is made upon the spot, and is considered much stronger, as well as safer, than that imported. They have now been using it for several months, and have never yet had a premature explosion, or any other accident, and not a single blast has missed fire since the Chinamen commenced filling the cartridges. The work upon this road seems to have fully set at rest the superiority of nitro-glycerine over powder, both for economy and safety. Of course this applies to the oil made upon the spot, and not to the imported article.

THE BIBLE ON SPIRITUALISM.—The Bible is often appealed to as a supporter of "spiritualism." Let us cite a few texts for the consideration of such as have read their Bibles to so little purpose as to hold to such ideas:

Regard not them that have familiar spirits; neither seek after wizards, to be defiled of them.—Lev., xix: 31.

And the soul that turneth after such as have familiar spirits and after wizards to go astray after them, I will set my face against that soul, and will cut him off from among his people.—Lev., xx: 6.

There shall not be found among you \* \* \* a consultant with familiar spirits, or a wizard, or a necromancer [one who inquireth of the dead]. For all that do these things are an abomination unto the Lord.—Deut., xviii: 10 to 11.

And when they shall say unto you: Seek [look] unto them that have familiar spirits, and unto wizards that peep and that matter; should not a people seek [look] unto their God [when they wish to inquire] for the living to the dead?—Josiah, viii: 19.

From the above, and from similar texts, it is plain not only that "spiritualism," as now popularly understood, is no new thing, under the sun; but that the Bible plainly teaches that "consulting familiar spirits" and "inquiring of the dead," except through God himself, is not only forbidden, but he that practices it, or employs another to practice it, subjects himself to a most terrible retribution.

PRECAUTION AGAINST FIRE.—Mr. James Leland, of the Occidental Hotel, exhibited to us, yesterday, an additional precaution against fire in the Occidental Hotel. It is a pump of four inches diameter and twelve inches stroke, called "Hooker's Excelsior," and will throw a stream from the cellar to the roof of the building. This pump is connected with all the hydrants in the house, and it is difficult to see how a fire could get any start with the hose properly managed. The hose were taken to the roof yesterday, and a half-inch stream was forced twenty feet up into the air. Any part of the building can be commanded by this addition to their preventives.—Daily Alta.

It is to be regretted that all public buildings have not thus been provided with such simple and effective apparatus. Captain Cashing may consider the above test another high compliment for his California "Excelsior" pump. 11v14qr

A STRANGE METAL.—The Idaho World speaks of a "strange metal," which is found in the Pioneer quartz ledge near Placerville, which puzzles the metallurgists of those parts. It is said to be very dense, brittle, and so hard as to readily and deeply scratch glass; it is almost as brilliant as ormol, and yet it is comparatively light in weight. It is said to occur in detached pieces in considerable quantities in the mine mentioned.

**A VALUABLE DISCOVERY.**—An Eastern paper says that the Department of State has received information from the United States Consul at Lambayeque, Peru, that an important discovery has recently been made in Peru of the silk plant. Preparations are being made to cultivate it upon an extensive scale. The shrub is three or four feet in height. The silk is inclosed in a pod, of which each plant gives a great number, and is declared to be superior, in fineness and in quality, to the production of the silkworm. It is a wild perennial, the seed small, and easily separated from the fiber. The stems of the plant produce a long and very brilliant fiber, superior in strength and beauty to the finest linen thread. Small quantities have been woven in the rude manner of the Indians, and the texture and brilliancy is said to be unsurpassed.

**GRAFTING THE ROSE INTO THE LOCUST.** Our attention was called, a few days since, says the *Sonora Herald*, to a very pleasing and novel sight. Into the limbs of one of the locust trees which surrounded the Rifle building, has been grafted seven slips of a rose bush. But one of the grafts took, and this produced curious flowers. The stem is that of a rose bush, of course, and the leaves are shaped like a rose leaf; but in every other particular resembles that of the locust. The flower is a deep red, like a rose, but formed and looks precisely like the locust flower. It is a very pretty combination, and the first one of the kind we ever saw.

MR. PEABODY, it is said, purposes depositing Queen Victoria's portrait, which she presented to him, in the Marshall Institution, near Boston, and has built a new room there to receive it, which has cost him \$40,000.

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*, or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v14lf

#### GOVERNMENT HOUSE,

Corner of Sansome and Washington sts. SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE in every direction, every ten minutes. The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half they are required to pay at hotel. 7v13-6m SANBORN & CO

#### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

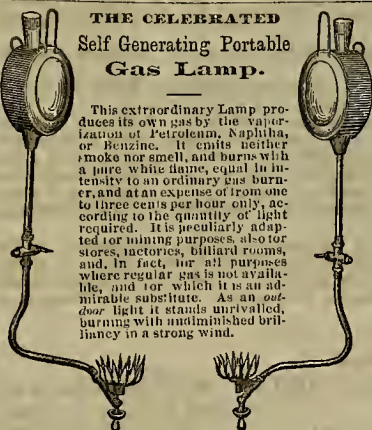

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw miller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the miller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the miller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above, presses all under the miller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

CONSTANTLY  
On Hand and for Sale.

#### THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light, it stands unrivalled, burning with undiminished brilliancy in a strong wind.

#### Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-3m

#### CUT NAILS.

2,000 KEGS ASSORTED SIZES,

To prevent this, purchase one of Taylor's Stench Traps and Garbage Baskets, And promote the health, comfort and cleanliness of your family. For description see Mining and Scientific Press, April 6, 1871. Sold wholesale and retail by TAYLOR & SONS, at No. 420 Pacific street, San Francisco. 15v14f

#### Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 534 Sacramento street, opposite What Cheer House, San Francisco. 16v14-ly

#### To the Mining Community.

THE UNDERSIGNED, WHO HAS HAD THIRTY YEARS' constant practice in superintending mines, is now prepared to inspect and report on Mines and Mining Properties, and advise as to the management of the same. Office, 851 Harrison street, San Francisco. 16v14qr

WILLIAM WILLIAMS, Practical Mining Engineer.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the *MINING AND SCIENTIFIC PRESS*, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

#### Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done, and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., 9v14-6m15p Corner of Front and Market streets.

"EL PORVENIR."—This journal, published at Rivas, Nicaragua, by Henry Götzel, in both the Spanish and English languages, evinces a commendable enterprise, entitling it to the support of persons interested in the progress of the country in which it is published. Files of our paper can always be found at the office of *El Porvenir*.

THE SMELTING FURNACE, which we described in our issue of the 8th inst., we are informed by Mr. O. W. Easton, is quite similar in design to one originally devised by Mr. J. H. White, of this city; which latter was a modification of the well-known Siemens's furnace.

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by

D. H. WOODS,  
No. 28 Third street.

## MECHANICS' INSTITUTE.

### Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.

The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1868, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.

Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity.

The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear, legible writing, so as to admit of easy reading.

The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges:

Hon. Fred'k F. Low, Maj. Gen. H. W. Halleck, U. S. A.,  
Prof. J. D. Whitney, S. A.,  
James Otis, Prof. W. B. Ewer,  
Wm. Governor Morris, B. N. Bugbey.  
By order of the Board of Directors.

D. E. HAYES, Secretary.  
San Francisco, June 12, 1867. 24v14-2m

### Cholera---Perry Davis' Vegetable Pain Killer.

MR. PERRY DAVIS—Sir:—The benefits I have received from the use of your invaluable remedy, the Pain Killer, induces me to pen a word in its praise. Experience has convinced me that for Headache, Indigestion, Pain in the Stomach, or any part of the system, severe Chills, Whooping Cough, Colic, Hysteria, Cholera, Cholera Morbus, Diarrhoea, Dysentery, Toothache, &c., there is nothing better than the Pain Killer. I have this hour recovered from a severe attack of the Sick Headache, by using two teaspoonfuls, taken at thirty minutes interval, in a wine glass full of hot water. I am confident that through the blessing of God, it saved me from the cholera during the summer of 1843. Travelling amid dust, toil, change of diet, and constant exposure to an infected atmosphere, my system was daily predisposed to dysentery attacks, accompanied with pain, for which the Pain Killer was a sovereign remedy. One tea-spoonful cured the worst case in an hour, or at most, half a day! I have heard of many cases of dysentery being cured by its use. For the teeth, it will stop the toothache. Gratitude, and a desire for its general use, has drawn from me this unsolicited testimonial in its favor.  
D. T. TAYLOR, Jr., Minister of the Gospel.  
Sold by all Medicine Dealers every where. 25v14-1m

**Postage**.—The postage on the MINING AND SCIENTIFIC Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) five cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

### FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

### Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—Set the Pan, A, level, by its inner rim.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in our case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length.

The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

### References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL.....	Grass Valley, Nevada County.
CONEY & BIGELOW MILL.....	Jackson, Amador County.
SPRING HILL MILL.....	Amador, Amador County.
GOLDEN GATE MILL.....	Volcano, Amador County.
GOLDEN RULE MILL.....	Stewart Flat, Placer County.
BENTON MILL.....	Bear Valley, Mariposa County.
LOUISIANA MILL.....	Coulterville, Mariposa County.
PEOPLE'S MILL.....	Alleghany, Sierra County.
TYRON & CO'S MILL.....	Prescott, Arizona.
WOOLSEY & CO'S MILL.....	Prescott, Arizona.
NOYES & CO'S MILL.....	Prescott, Arizona.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.

RECENTLY ORDERED FROM THE UNION IRON WORKS:

VEATCH, VALENTINE & CO., Commercial Mill (4 Concentrators).....	Nevada County.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (4 Concentrators).....	Prescott, Arizona.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Mariposa County.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
MOREY & SPERRY (1 Concentrator).....	New York.

And in use in many other parts of this coast.

These Machines are made of iron, thoroughly constructed and ready for immediate use. For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

### CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,  
Union or Fulton Foundry, San Francisco.

March, 1867.

## W. T. GARRATT, City BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts.,  
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or  
Babbet Metal Castings;  
CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and  
Valves of all descriptions, made and repaired. Hose and  
all other Joints, Spelter, Solder, and Copper Rivets, &c.  
Cauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fit  
tings, &c. Coupling Joints of all sizes. Particular attention  
paid to Distillery Work. Manufacturer of "Garratt's Patent  
Improved Journal Metal."

23" Highest Market price paid for OLD BELLS, COPPER  
AND BRASS. 61r

## Foundry for Sale.

A One-half Interest in the

UNION IRON WORKS,  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the  
most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It  
is seldom that so good an opportunity is offered for a sure  
and permanent investment. The business of the establishment  
is exceedingly flourishing, as can be shown. The  
Shop is of brick, new and well built. The lot is 85 feet front  
by 163 feet in depth, in a good location for this business, on  
Front street, between N and O streets.

Inquire at the office of the Foundry, or address

WILLIAM R. WILLIAMS,  
Sacramento, Cal.

## Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11  
o'clock A. M. of the following dates, for  
PANAMA, connecting via Panama Railroad, with one of  
the Company's splendid steamers from ASPINWALL for  
NEW YORK.  
On the 10th, 18th and 30th of each month that has  
30 days.

On the 10th, 19th and 30th of each month that has  
31 days.

When the 10th, 19th and 30th fall on Sunday, they will  
leave on Saturday preceding; when the 18th falls on Sunday,  
they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-  
Atlantic Co.'s steamer for St. Nazaire, and English steamer  
for South America.

Departure of 10th connects with English steamer for  
Southampton and South America, and P. R. Co.'s  
steamer for Central America.

The following steamships will be dispatched on dates as  
given below:

June 29th—MONTANA.....Capt. Jos. Sinton,  
Connecting with OCEAN QUEEN, Capt. Maury.

Cabin passengers berthed through. Baggage checked  
through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attend-  
ance free.

These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.

Through Tickets for Liverpool by the Canard, Inman and  
National Steamship Lines, can be obtained at the office of  
the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way  
ports, apply to Messrs. WELLS, FARGO & CO.

The COLORADO will be dispatched July 4, at noon,  
and will be followed by the GREAT REPUBLIC, on August  
24th, from wharf, corner of First and Brannan streets, for  
YOKOHAMA and HONGKONG, connecting at Yokohama  
with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific  
Mail Steamship Co's office, corner of Sacramento and  
Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

## \$85 for Hunter's

## Improved Concentrator.

The patentee is prepared to sell his Concentrators for  
the above price, and guarantees, when the machines are  
run according to directions, to give 20 per cent better re-  
sults than from any Concentrator built on this Coast, and  
will refund the money if they will not perform what is  
claimed for them. Machines with copper plates, will cost  
\$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Union Foundry, up stairs. Parties pur-  
chasing Concentrators will do well to examine before buy-  
ing others of pretended merit. Persons desiring it can have  
a practical concentration made of tailings at any time, and  
prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.  
For sale, the right to build and use in mills. A working plan  
will be furnished each purchaser. Five machines can be  
seen in operation at the Eureka Mill, Grass Valley. The  
cost of the iron for the machine, without the iron-box, is  
about \$100. The box will answer of wood.

By reference to the Mining and Scientific Press of May  
25th, a full description of the above Machines may be found.

For particulars, send for Circulars, or address  
ANDREW HUNTER,  
Union Foundry, San Francisco.

# Mining AND SCIENTIFIC PRESS.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,  
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, JUNE 29, 1867.

VOLUME XIV.  
Number 26.

For Table of Contents, see last page.

OUR FOURTEENTH VOLUME CLOSES with to-day's issue, and next week will present a favorable opportunity to commence subscriptions and advertising for a new volume. Those who desire to give their business a wide circulation among reading and intelligent people, and especially among miners and mill men, will do well to secure the advantage of the advertising columns of the MINING AND SCIENTIFIC PRESS. This paper finds its way into our principal hotels, reading rooms, in all college and other schools, etc., and bound volumes and monthly parts are found in the saloons of all the river and ocean steamers. The paper is also received by large numbers of scientific persons and societies, and mining men in all parts of the world. More volumes of this paper are bound for preservation and future reference than of all the other periodicals on the Pacific coast put together. Now is the time to subscribe and advertise. A glance at our voluminous index for the past six months, will afford the stranger to our columns a very good idea of the character and variety of the subjects discussed in this paper. It will be observed that our attention is devoted to the useful rather than ornamental—a feature which we believe is rapidly growing in favor with California readers generally.

**SANTA CLARA COLLEGE.**—The sixteenth annual commencement of this institution took place on Tuesday and Wednesday last. The exercises were unusually spirited and interesting. The various addresses bore high testimony to the excellency and thoroughness of the system of instruction pursued at this institution.

The first literary exercise was a critical essay, by J. T. Rogers, entitled "History," which evinced a marked degree of talent and research. "The Carboniferous Epoch," by Jos. Wiley, was the title of another subject, which was handled in a manner which would have done credit to even a professor in the difficult science under consideration. "The Patriot's Cry," by Joseph McQuade, was a heart-stirring and well written poem. "Mother," an elegy, by R. Gray; "The Equilibrium of the Three Kingdoms of Nature," by A. L. Sage; "The Chinese in California," by T. A. Sutherland, spoken by James Hermann; "The Tax on Education," by W. B. Murphy; "Regicides," by A. Sweet, and "Our Martial Progress," by C. C. Arqués, were each excellent in their way. The exercises continued three days, and were interspersed with music and domestic entertainments. The degree of A. M. was conferred upon S. A. Lyon, A. B. The degree of S. B. was conferred on L. Sage and Jos. Wiley.

The number of students connected with this institution is 216, which is one of the most flourishing and thorough institutions of learning in the State.

We regret that our inability to be present prevents a more extended notice of the exercises. We shall endeavor to remedy this defect another year.

## Kirkup's Patent Spike.

We herewith present our readers with an illustrated description of a newly invented spike, to which we made a short reference some four months since. The advantage of such a means of securing rails to their supports, especially on the dry plains of California, and the arid deserts between the Sierra Nevada and Rocky mountains, must be apparent to the most casual observer. Great difficulty is found in keeping the ordinary snake-headed spike in place in all dry climates; but with a spike constructed after Kirkup's patent, it would seem that this difficulty must be pretty effectually obviated.

In the illustration, Fig. 1 represents a "snake-headed," and Fig. 2 a "round-headed" spike, of this description. The spike is split from its pointed end in the direction of its length, and the two prongs

does the ordinary spike. The spike, however, can be readily drawn, and it requires but a blow of a hammer to straighten the prongs, when it will be ready for use again."

This invention was patented on January 2, 1866, by Launcelot Kirkup, of Brooklyn, N. Y., and it has also been patented in the principal European countries. The entire invention has been assigned to "The International Patent Bolt Machine and Split Spike Company," and any further information concerning it may be obtained of the President of the company, H. A. R. Moënat, 71 Broadway, New York City.

**THE HUMBOLDT RIVER.**—Some considerable attention is being paid to the utilization of our interior rivers. If we are not mistaken, a steambot is already in process of construction for the navigation of the upper waters of the Columbia river.

It is also thought that the Humboldt river,

KIRKUP'S PATENT SPIKE.

are beveled in alternate directions. When the spike is driven into the sleeper the two prongs diverge in opposite directions, the chisel edge cutting the way for each prong, and the bevel edge throwing it outward. With a  $4\frac{1}{2}$  inch spike the prongs diverge about  $1\frac{1}{2}$  inches. It can be very readily understood that a spike having the position in the sleeper shown in Fig. 3 will retain its hold against any casual displacement incident to the jarring or trembling of the rails occasioned by passing trains, and the expansion and contraction occasioned by heat and cold.

The *American Artisan*, in which this spike was first described and illustrated, says of it: "We are informed that the saving in weight of metal per mile over the ordinary spike amounts to 1,750 pounds, and that the power or weight required to draw a "snake-headed" spike of the above construction which is driven outside the rail, is about 5,986 pounds, and the "round-headed" spike, which is driven through an eye in the flange of the rail, about 7,656 pounds; whereas experiment shows that the power or weight required to draw a spike of ordinary construction is 1,960 pounds, thus showing that it requires about three times the power to draw the split spike that it

which has its course altogether in Nevada, may, at small cost, be made navigable for nearly the entire year; thus bringing into cheap steam communication the eastern and western portions of Nevada. According to a late number of the *Owyhee Avalanche*, a party, desirous of testing its navigable qualities, recently constructed a small boat near the upper portion of the river, and proceeded downward along its course. For many miles the river was found to be two and a half to six feet in depth, but very crooked and about sixty feet in width. The character of the river is very uniform from near its source to its mouth, with only occasional rapids and shallows. To render it navigable, two or three dams would have to be removed, and a number of wing-dams constructed to deepen the channel. On approaching its mouth, the party could not find a passage into the lake, owing to the rank growth of the tules; yet it is said that an outlet forty feet in breadth, opening into the lake or sink is known to exist, and has been passed through by settlers and Indians.

**THE Merchants' Floating Dry Dock** was launched in our harbor on Thursday.

**THE MANAGEMENT OF STEEL;** by George Ede, employed at the Royal Gun Factory Department, Woolwich Arsenal, (Eng.) Revised and enlarged from the fourth edition, by D. Appleton & Co., New York, 1867. For sale by A. Roman & Co., San Francisco.

The above publication shows the work of a practical mind. Mr. Ede is no mere theorist; but is one who has a thorough practical knowledge of what he writes. The title, "The Management of Steel," does not at all comprehend the full scope of the work. The writer treats upon both iron and steel, in nearly all their forms, conditions and manipulation. Though not exhaustive, it nevertheless embraces about everything that is essential to be known to the practical iron worker. It treats upon the manufacture of iron and steel, the choosing of steel for tools, annealing cast-iron and steel, hardening and tempering of the same, expansion and contraction of steel, shrinking of cast iron and steel, the case-hardening of wrought iron, toughening of steel for guns, shot, railway bars, etc.

This little work, of only 220 duodecimo pages, will be found an inestimable treasure to young mechanics who wish to make themselves better acquainted with the materials upon which they work, and out of which their tools are made. The importance of such information, both to young apprentices themselves and the world at large, can scarcely be estimated. Science and the arts would thereby be advanced, while the power of the hand to contrive, and the hand to execute, would be greatly enlarged. Valuable inventions would multiply, while those which perish at their birth, and see the light only to impoverish instead of increase the wealth of the inventors, would be few indeed.

**EFFECT OF ELECTRICITY ON MOLTEN IRON.** Of all the remarkable applications of electro-magnetism, which have recently been made, perhaps the most extraordinary is that of its introduction into a mass of molten iron! It is said that this experiment was recently tested at one of the leading iron work establishments in Sheffield, with most unexpected results and success. The effect is described as surprising; the metal appears to bubble and boil, while the perfect fusion is much expedited, and the quality of the iron greatly improved in toughness and hardness. It appears that much of the impurity that remains after the ordinary process, is driven out by the action of the magnetic current; hence it is inferred that this new application of electro-magnetism, may be regarded as full of promise in this direction. It is to be hoped that further particulars may soon be made public; and in the meantime it is suggested that it is a case for the application of Wilde's electro-magnetic machine. If there is anything in the alleged discovery, it would seem that with the powerful currents thereby generated, the results must be proportionally important. The accounts do not describe the manner in which the current is introduced into the molten mass. The inference, however, would seem to be that the furnace is isolated, and kept fully charged by a powerful battery. Smee's battery was used in the instance referred to.

## Communications.

IN THIS DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## The Universal Exposition.

BY A. S. HALLIDIE.

PARIS, May 7, 1867.

The general display of machinery at the Exposition is very great. France of course comes in for the chief share; but England has a better showing of machinery in motion. There is very little new from anywhere; but the United States, "poorly represented" as it is, nevertheless presents many more new things, in proportion to its display, than any other country.

## THE DISPLAY OF LOCOMOTIVES.

There has been and is a marked improvement in French machinery. One does not see so much of nice complication of detail as in the London Exhibition of 1851; but there is a much greater simplicity, economy and solidity; and it gives evidence of the fact that France is turning her attention more to practice and less to the theory. There are a number of locomotives exhibited by France, one of which, by Ernest Gouin & Co., made for the Northern Railroad, has six wheels on each side, coupled together—diameter of wheels three feet four inches—driven by four cylinders; total weight about sixty tons. There is another locomotive, exhibited by the Paris and Orleans R. R. Co., named the "Cantal," which is beautifully finished, with proportions of parts excellent. It has five wheels on each side, coupled, diameters 3 feet 5½ inches, driven by two cylinders 19 inches diameter by 23½ inches stroke. The boiler has 280 tubes 16 feet 3 inches long; total weight of engine, about 60 tons. There is a great variety of locomotives exhibited by France and Belgium, nearly all of which weigh from 40 to 60 tons each. Belgium produces some well finished locomotives; but nearly all have a great overhang, of eccentric rods, etc., etc., which give them a very wide appearance. By far the finest locomotive in the Exposition is one exhibited by the Grant's Locomotive Works, of Patterson, New Jersey. This locomotive is the envy of all machinists here, and is generally praised both for its beauty of proportion and excellency of construction and finish. It is stuck out in a shed, outside of the main building, when it should occupy the most advantageous and prominent position. In this particular, as in others, we are behind.

## OUR NATIONAL COMMISSIONERS

Are also behind; and the Commissioner from California has not yet shown himself. There is perhaps some excuse for our being backward, and some justification for the complaint that our department is not fully opened for such a long time after the general opening. The barriers in our portion of the United States were not taken down until Saturday last—six weeks after the general opening!

## RAILWAY CARRIAGES.

France and Germany exhibit some very comfortable and elegant railway carriages, many of which are two stories high. Some of the German first-class are furnished with tables, water-closets, etc., to each compartment. The second-class carriages are well fitted up, and certainly comfortable enough to suit almost anybody; but being arranged like a series of stage coaches, into which one is locked, there is a feeling of insecurity which one does not realize in the long, open railway car in the United States—where a person can escape from car to car in case of fire or accident, and be at all times in communication with the guard. Nearly all the German lines have four classes.

## DISPLAY OF MACHINERY.

The general display of machinery is very great, especially in the line of machine tools. There are planing machines, drilling, turning, boring and shaping machines in abundance. Ducommun & Co., of Mulhouse, France, exhibit, among other tools, a fine large lathe, which takes in seven feet diameter, with a bed forty feet long; another, a planing machine, with bed seven feet wide,

twenty feet long. There is a most beautiful lathe for turning ivory, exhibited by Germain, of Paris. It is finished with the most delicate polish, and although it looks more like an ornament than a useful tool, yet it is used and does its work well.

Grafteustaden exhibits a fine horizontal engine, four-foot stroke, 24-inch cylinder; also a combined drilling and planing machine, the bed of which is forty feet long and six feet wide.

Farcot & Sons have a very fine and beautifully finished horizontal engine, with two cylinders 36-inch diameter, five-foot stroke; this forms quite an attraction, from its size and elaborate finish.

## HOISTING MACHINERY.

There are a number of direct-acting engines, for hoisting from mines, the general arrangements of which are, that the cylinders either set directly under or over the winding drums, and connect with cranks, keyed on to main shaft of winding drums. These are mostly intended for flat ropes, and the drums usually have a diameter of eight to nine feet on the barrel, and measuring about 30 feet diameter, outside of flange, according to the depth proposed to sink. I do not find any very great improvement, in detail, over our own hoisting apparatus, except that the drums on which the ropes wind have a large diameter, which of course is all-important for the economy of the rope. The display of wire rope is very large—larger than any other kind of ropes; and it is really astonishing how this branch of manufacture—which was only commenced about 35 years ago by Mr. Andrew Smith—has sprung into existence everywhere.

## ROCK-DRILLING MACHINES.

Since the tunnel at Mount Ceniz has reached its present enormous length, the necessities for boring and drilling by machinery have called for a number of ingenious contrivances for obtaining the requisite power without the aid of steam, and there are several machines in the French department devised for this purpose.

## THE DIAMOND DRILL.

There is a boring machine—Class 47, No. 49, French department—which is said to have done good work on the southern French railroads, and which bores a two-inch bore, 3½ inches deep, per minute, in ordinary hard rock, running at 250 revolutions per minute. The cost of the machine, complete, is \$500. The drill has diamond points and revolves; duplicate cutters cost \$35; the old diamonds will fetch here \$15. I saw some work it had done in hard quartz rock, where it bored a good clean hole. The machine sets on a frame suitable for boring in any direction and at any angle.

## MINING VENTILATORS.

There are a number of models of systems of ventilation for mines; none of which I saw show any practical idea ahead of our own.

## MACHINERY FOR CUTTING COAL.

There are exhibits in both the French and English departments. The English machine seems best adapted for the work, and has been improved from time to time, as circumstances and requirements arose. It is probably not the kind of machine altogether required; but it is a material advance, in point of economy, for the extraction of coal over the hand labor usually employed. It has been adopted by a great many coal mining companies in Great Britain. The main objection I judge to be its weight and size. The necessity for a machine which will do the work now done by hand, at great cost, and sometimes unnecessary delay, and that will do it better and with less loss of coal, is felt so strongly in Europe, that some of the coal mine owners have offered a large premium for the best machine of this kind.

There is a coal-cutting machine exhibited by Messrs. Jones & Levis, of England, which seems to be a good machine. It cuts at any angle to a depth of three feet; the cutter is 1½ inches wide. It makes about 100 strokes per minute, and cuts out twelve yards of coal per hour, employing about seven-horse power to drive it. The machine weighs about 12 cwt., and costs about \$500, complete. On my return to England, I propose to examine more into the application of these machines, practically, and will inform you of the result.

## MISCELLANEOUS DISPLAYS.

There is a large display of iron work from all parts of Europe. There are various blocks and pyramids showing the proportions of gold produced by different countries. But California is not there. In fact California, comparatively speaking, is not anywhere! There are a few bottles of wine stowed away in one part of the building. Harrison's pump (which only started to-day) in another portion; woolen goods (a good display) in another; Hallidie's wire rope in another; and the photographic views of Yo-

Semite on the wall, with no explanation of who by, what for, or what it is. Having no explanation, is characteristic of the whole Exhibition. I suppose the object is to effect a better sale of catalogues; but when you turn to them you are still as much in the dark as ever, so far as details are concerned. More by and by.

[Written for the Mining and Scientific Press.]

## The Reese River Country and its Mines.

BY A. J. HOWK.

[Continued from Page 386.]

## ROADS TO THE "GREAT SOUTHEAST."

Until recently, the principal road traveled in reaching this section from the western part of the State and California, has been by the Overland Mail route, via Austin; but the indirectness of the route has caused two other routes to be looked out, which were mentioned in a former letter. Both these roads leave the overland at White Rock, and are yet unfinished east of Mammoth District; however, the entire route to Hot creek is being put in the best possible condition, and when completed it will be the most direct and best route to the "Great Southeast." Miller & Ripley's stage is already running on the route from Virginia City to Belmont. A large force is employed at different points on this road, principally at the expense of citizens of Mammoth; and before this is published, the traveling public will be invited to use it free. The other road, via Ophir Cañon, will be finished during the summer; but, as I have previously said, it is objectionable for heavily-loaded teams, especially those destined for Belmont and further east. Still it is a necessity for Ophir, and a great convenience to Northumberland and the traveling public visiting these places. Two articles have been published by the Reese River *Reveille*, grossly misrepresenting these routes, particularly the one via Cloverdale, which that paper characterizes as nearly destitute of water and "almost impassable in consequence of sand." Such statements, made in utter ignorance of the country, are quite as bad as deliberate misrepresentations, and not in harmony with the *Reveille's* statement, that they "wish to discuss the question of routes fairly and upon facts." However, but few residents south of Austin believe that they wish to discuss this question otherwise than in the interest of Austin. At the close of the article previously quoted from, we find their desire revealed in the following: "If mail routes are asked for to accommodate any portion of the Reese River section, this city (Austin) should be named as the starting point." What say the people of the rich districts of the Mammoth and Shoshone Ranges when they are told that their California mails must come by a circuitous route, over one hundred miles out of the way, in order to pass through Austin? I know that a saving of three or four days travel on the trip to Belmont is a large item to teamsters in these days of low freight, and, consequently, I wish to speak fairly for their benefit. I have no ranch, neither have I any interest to be advanced by directing travel to the Cloverdale route. Very many of those who visit the "Great Southeast" will desire to pass through Austin, either going or returning, and there is no great objection to that road for those who have plenty of time to spare.

The route via Austin follows Smoky Valley, on the Ophir and Austin stage road, to the vicinity of Spaulding's salt marsh; thence it strikes diagonally across the valley to the mouth of Charnock's Pass, in the southern part of Northumberland District. This Pass is one of the best natural grades in that part of Nevada, and will also be used by the White Rock and Ophir Cañon road when the latter is completed. After leaving Charnock's Pass, we soon reach Pine creek, a fine stream running eastward into Monitor Valley. Here the road branches—one branch striking directly across Monitor Valley twelve miles to Barley creek and

Alatony Pass, where an excellent graded road is being built by Messrs. Clark & Co. on the main route to Hot creek and Pahrana; the other leading south, down Monitor Valley, to Belmont. Another route, diverging from the main one soon after entering Smoky Valley, crosses the Silver Bend Range through Clipper Gap, nine miles north of Northumberland. This has been used, thus far, by loaded teams through to Hot creek and Pahrana, in consequence of there being no road built over the Danville Range between Belmont and Hot creek. The excellent one now being constructed will attract the travel that way. At Barley creek, all the roads leading from the west (except the Clipper Gap) unite and pass eastward through the Hot creek region, and directly on to Reveille and Pahrana; thence diverging south to Prescott and Fort Mohave in Arizona.

## PHILADELPHIA DISTRICT.

This famous district, better known as Silver Bend, is, at the present time, the center of attraction for the migratory and restless miners of Nevada. It is located on the eastern side of the Silver Bend Range, in latitude 38° 20', thirty-four miles south of Northumberland, and is eighty-five miles distant from Austin, in a S.S.E. direction. The first discovery of this district was in the fall of 1865. But little attention, however, was given it until one of the original party (formerly Recorder) returned with others, in April, 1866, and reorganized the district. In the ensuing month of May, David E. Buel followed, and henceforth Belmont (like Austin, which owes a large share of its early progress to Buel) grew rapidly, until a population of twelve hundred occupied the district, where one year ago but three or four white men had ever trod its hills of gray slate. The usual energy and enterprising spirit of Buel impelled him to invest here, and by the middle of September he had his mill of ten stamps in operation. The mill is constructed for wet crushing, and has no facilities for roasting the ore; consequently, but little more than half the silver is saved. Notwithstanding this, over \$120,000 has been produced by it during the six months it has been running. This bullion was produced from about 1,200 tons of ore from the Highbridge lode.

[To be Continued.]

**PYROTECHNICS.**—As the national jubilee is approaching, in the celebration of which pyrotechnical displays always form a marked feature, it may be interesting to many of our readers to know how some of the brilliantly-colored lights are made which are exhibited in the rockets, Roman candles, etc. The ingredients for each of these different colored stars for rocket heads, etc., are made separately, being finely pulverized, and made up into a thick paste with water. When of proper consistency, the mass is rolled into suitable thickness and punched into separate pieces of the size desired for each separate star, and then carefully dried until quite hard. The different colors are prepared, with some slight variations, as follows:

**Red Stars.**—Dried nitrate strontia, 4; chlorate potash, 2; sulphur, 2; black sulphide antimony, 1.

**Green Stars.**—Nitrate baryta, 5; chlorate potash, 2; sulphur, 2; black sulphide of antimony, 2.

**Lilac Stars.**—Chlorate potash, 49; sulphur, 25; chalk, 20; black CuO, 6.

**Purple or Blue Stars.**—Chlorate potash, 42; pure nitrate potash, 22; sulphur, 22; CuO, 10.

**White Stars.**—Saltpetre, 16; sulphur, 4; black sulphide antimony, 5.

Blasting powder, finely pulverized, is meant in the following receipts:

**Tail Stars.**—Blasting powder, 8; sulphur, 8; saltpetre, 8; coarse charcoal, 8.

Charge for 2 oz. Rockets.—Blasting powder, 20; charcoal, 6; saltpetre, 4. A moderate amount of blasting powder for the head to light and disguise the stars.

Composition for Roman Candles between the stars lying on powder of the best quality.—Saltpetre, 5; blasting powder, 1½; sulphur, 1; sand, 1.

**Spur Fire.**—Saltpetre, 4½; sulphur, 2; finely powdered and mixed, and then gently rubbed with lampblack, 1½; pack in cases six inches long and three-fourths internal diameter.

**BUILDING IN CHICAGO.**—It is said that three millions of dollars' worth of new buildings in Chicago, that had been in contemplation the present season, have been abandoned on account of the eight-hour movement.

## Mechanical.

**THE PRODUCTION OF IRON.**—The total production of the blast furnaces of Great Britain amounts to about 5,600,000 tons—which is about one-third of the entire iron product of the world. France produces a most inconsiderable quantity in proportion to her population, the amount not exceeding 800,000 tons—less than the product of the single county of South Staffordshire, England. The annual make of Spain is next to nothing—8,000 tons; while that country is actually rich in the mineral, and forms a population of 15,000,000 souls. Sweden and Norway have long been celebrated for their iron mines, which produce a quality of iron inferior, in the aggregate, to that of no portion on the globe. There are 500 iron mines worked in Sweden, which, in 1834, yielded 500,000 tons of ore. But very little bar iron is manufactured there—not over 300 tons. The make of plates is about 5,000 tons, and about the same quantity of cast steel by the Bessemer process.

**THE ART OF GRINDING TOOLS.**—More than one-half the wear and tear and breakage and bother of dull tools comes from a lack of proper knowledge and practice in grinding. All steel, however highly refined, is composed of individual fibers laid lengthways in the bar, held firmly together by cohesion; and in almost all farm implements of the cutting kind the steel portion which forms the edge, if from a section of a bar, is laid in and welded to the iron longitudinally, so that it is the side of the bundle of fibers hammered and ground down that forms the edge. Hence, by holding on the grindstone all edge-tools, axes, drawing-knives, knives of reapers, scythes, knives of straw-cutters, etc., in such a manner that the action of the stone at right angles with the plane of the edge, or, in plainer words, by holding the edge of the tools square across the stone, the direction of the fibers will be changed, so as to present the ends instead of the side as a cutting edge; by grinding in this manner a finer, smoother edge is set, the tool is ground in less time, holds an edge a great deal longer, and is far less liable to "kick out" and break.—*Germantown (Pa.) Telegraph.*

**INVENTIONS NEEDED.**—A correspondent of the *Scientific American* claims that there is money to be made by inventors who will bring forward improvements which are in urgent demand, and of which the following are a few which are suggested: A device to admit air and light, while it excludes dust, through window and door openings. It would be well nigh invaluable in every store of fine fabrics in almost every city of the globe. To railroad cars it would add the last and much needed desideratum for that kind of travel, and suppress its most serious nuisance. A method by which fresh meats can be preserved, similar to canned fruits, and taken to sea. Preserving meats by salting, abstracts a large part of their nutritious qualities. A noiseless application of power to vehicles, to do away with the over-crowd of horses in large cities. A device for heating city railroad cars, omnibusses, etc., other than by stoves. The want of warmth in these vehicles adds largely to the ill health and discomfort of citizens in this latitude. A compact laundry machine, by which family washing and drying can be accomplished in a small space, without exposure to open air. In yards and enclosures of large cities sunlight is generally shut out, and dust abundant.

**STEAM IN LOCOMOTIVE BOILERS.**—The facility with which steam is made in locomotive boilers, is well known to engineers, and is evidently greater than can be attributed to the excess of draft facilities which they possess. The secret doubtless lies in the fact that the motion of locomotives upon the rails assists materially in liberating the steam generated in the lower parts of the boiler, and thus in maintaining a proper circulation of water.

**ICE FOR THE EXPOSITION.**—M. Carre's freezing apparatus has been set up in the park connected with the Paris Exposition, to supply ice for the restaurants. The principle of this machine is the same as that to which we have several times alluded, as used on a small scale in this city.

**RE-INVENTIONS.**—A paper was read at a late meeting of the Institution of Naval Architects, by Mr. McGregor, showing how inventions relating to marine propulsion have been many times re-invented and patented. The examination, undertaken for official purposes, extends over a period of 250 years, embracing over 1,000 patents of this class granted during this time, but had reference chiefly to some 800 granted ten years ago.

First, as regards the power employed for propulsion; he found that aside from steam, ten distinct patents were granted for obtaining the power from animals, thirteen from wind exclusive of sails, six from springs, three from gunpowder, twelve from compressed air, thirteen from gas, and six from electricity. Of the Water Witch style of propulsion, by ejecting water from the vessel, fifty-nine patents had been taken out. Plans for propulsion by discharging in a similar way, gas, fire, or steam, were protected by twenty-nine patents. The paddle wheel itself, under nine patents by animals, thirteen by men, and one by combined action of steam and manual power. Feathering floats have been patented scores of times, every case being almost identically the same in principle and construction.

The screw propeller has a like series of duplicates of inventions where patents for an increasing pitch number five, adjustable pitch fourteen, sixteen were granted for screws to steer with, thirteen for screws in tubes, six for screws and paddles combined, and twelve for the form now called "twin screws." Before the year 1858, 140 patents were taken out for propellers with fore-and-aft motion, and precisely the same plan has been repeatedly patented within the last nine years.

**BERNABE'S IRON COPPERING.**—Admiral Viscount de Chabannes, at Toulon, writes in a published letter that not only is the adhesion of the iron and copper by M. Bernabé's process as employed in the arsenal of Toulon, so perfect that they are not started apart by hammering, bending or breaking, but that if a hole in the copper at any time occurs from abrasion, the part can be re-coppered on the spot, as effectively as before. If this means that a repair of this kind can be effected on a ship's bottom, the method may very well have all the value attributed to it.

**CREOSOTED TIMBER.**—A creosoted sleeper, put down on the Stockton and Darlington railway, in England, in August, 1841, was taken up March 14th, 1867, after nearly 25 years service. The grain of the wood, although slightly discolored by creosote, is as fresh, and apparently as tough as that of newly-sawn timber, and the odor of creosote is as strong as if the wood had just been operated upon.

**A NEW MODE OF BRIDGE CONSTRUCTION.** Among the models exhibited at the Paris Exposition, is one by Thomas Dunn, of Manchester, Eng., illustrative of a mode of erecting a steel bridge by weaving straight bars into a self-supporting structure progressing from the shore, without supports or scaffolding.

**A GRINDSTONE** should not be exposed to the weather, as it not only injures the wood-work, but the sun's rays harden the stone so much as, in time, to render it useless. Neither should it stand in the water in which it runs, as the part remaining in water softens so much that it wears unequally, and this is said to be a very common cause of grindstones becoming "out of true."

**THE WEAR OF WHEELS ON RAILWAY CURVES.**—It is found necessary on some railways having numerous short curves, to have the flanges of the driving wheels of the ordinary 6-wheeled engines, turned anew as often as every six weeks.

**RAILS WITHOUT CHAIRS.**—The Northern Railway of France, on which are employed some of the largest locomotives ever constructed, has been partly relaid with the high-noses or flat-footed rails, spiked directly to the sleepers, the joints being fished, and no chairs being used.

**TANK LOCOMOTIVES** are now fast coming into use on railways. It is believed that the first locomotive of this description was the *Novelly*, constructed in England, by Messrs. Braithwaite & Ericsson.

**THE STEEL BRIDGE** of the Quay D'Orsay, near the Exposition building—the first of the kind yet built—is said to be a failure, having already sustained a deflection of at least three inches to the center.

## Scientific Miscellany.

**TELESCOPIIC DISCOVERY.**—The *Scientific American* is informed that a new double star, supposed to be below the defining power of more than two or three telescopes in the world, has been observed by means of the instrument in the possession of Jacob Campbell, Esq., of Brooklyn. It is almost in a line between Procyon and the companion star by which the defining power of first class telescopes is frequently tested. But although it is a common practice of astronomers to try their glasses by first observing Procyon and then waiting a few minutes for the companion star to come into the field, this new companion, which enters the field before the other, has never been revealed by any of the instruments so often crossed by it. Professor Wiulock, the astronomer at Cambridge, was informed of the discovery, and after some search with the fine Munich telescope of that observatory, detected the new star. The success of European instruments with the new test, is yet to be heard from.

**A FREEZING SPRING.**—Scrope, in his "Volcanoes of Central France," says that near Port Gihand, a short distance from Clermont, in France, there is a natural grotto, in basalt, from the interior of which gushes a small spring of water, near and about which ice is formed, even during the greatest heat of summer. The water is supposed to be cooled by means of the rapid evaporation produced by a current of very dry air, which issues from fissures in the rock which communicate with the grotto. This air owes its dryness to the absorbent qualities of the rock through which it passes. This dry air, in passing over the spring, absorbs moisture from it so rapidly as to keep its temperature constantly at or below the freezing point.

**GLYCERINE**, the substance which constitutes the base of that terribly destructive explosive agent, nitro-glycerine, is a clear, colorless, syrup, and constitutes the main and sweet principle in fats. When pure it has no smell. It is a most useful substance for chapped hands, or for any application where it is desirable to keep the air from reaching the skin, and hence keeping it moist—the great secret in the cure of such cases. It is, perhaps, the best hair oil in the world, and never takes on taint (heat not decomposing it, save at 600 deg.) Besides keeping the hair moist, it has the merit of not being dried by air, but, on the contrary, draws moisture from the atmosphere. Thus it makes a sweet, pure, durable oil for the hair. It is also the principal medicine for ear complaints—especially a dry ear.

**MUCILAGE** is closely allied to gum in many of its properties. It enters into the formation of certain parts of many vegetables, as in linseed, quince-seed, the roots of the mallows, etc., and is the chief constituent of gum-tragacanth. By the addition of sulphuric acid, it is convertible into glucose or the sugar of fruits. Its composition may be expressed by the following formula:  $C^{24} + H^{19}$ .

**WHY WAS IT?**—Two tubs with the same exposure, and about the same size, were standing under the eaves of a house, both nearly full of rainwater. One was a galvanic iron tub, the other a wooden one. In the morning the wooden one was covered with ice a quarter of an inch thick—the other had no ice on it. As there can be no effect without a cause, why was the one tub frozen over and the other not?

**TO DETECT COTTON IN LINEN.**—A mixture of cotton with linen may be detected by unraveling a piece of the tissue, hoth warp and weft, and plunging it into a solution of aniline and fuchsine. It should be taken out, washed, and, while moist, dipped in ammonia. The cotton threads will lose their color, while the linen will remain red.

**SCIENCE** is like the rain from heaven; if a drop of it fall into a gaping oyster, it becomes a pearl; if into a viper's mouth, it turns to poison.

**CHARRED WOOD** is inflammable in proportion to the lowness of the temperature at which it has been reduced. For gunpowder, the charcoal is made very slowly, at a low temperature, and consequently has a very low igniting point, requiring great care to prevent its igniting spontaneously. It is said that by taking years for the process, at a proportionally low heat, the dried and shrunken fiber, penetrated everywhere by air, will ignite at a temperature not far above that of boiling water. A charcoal sufficiently inflammable to be readily ignited by burning paper or shavings, would be a great domestic convenience for lighting anthracite coals, instead of kindling wood. Ordinary charcoal is retailed probably as low as kindling wood, for equal amounts of heating power; and the cost of slow charring, with cheap fuel and chemical aid, on a large scale, could hardly be more; while there would be a saving in freight, and a great advantage in the prompt efficiency of the article.

**CHARCOAL.**—The interesting mystery of the power of charcoal to absorb, condense and change gases to vapors, engages continued investigations. Among the latest investigations reported, the remarkable chemical activity in charcoal saturated with oxygen is displayed in the conversion of moist sulphurous acid and sulphureted hydrogen to sulphuric acid; common alcohol to acetic acid, and amyl alcohol to valeric acid; indicating a power of oxidation extending to a very wide range of effects, but to which ammonia showed an exception. The condition in which oxygen exists so largely and actively in charcoal is yet a mystery.

**THE CONVERTIBILITY OF ELECTRICITY AND HEAT** is illustrated by joining a bar of antimony and another of bismuth, end to end, and passing a current of electricity through them, first from the one end and then from the other. The current passing from the antimony to the bismuth will be found, by proper tests, to part with a portion of its electrical intensity at the junction, and to develop increased heat. That passing from the bismuth, on the contrary, will manifest increased electrical tension, evidently at the expense of the pre-existing heat, for the bar at that point will be colder than before the current passed.

**ZINC AND MILK.**—Vessels made of zinc should never be used for holding milk, as when milk is allowed to repose in contact with this metal, a lactate of zinc is formed, as well as a compound of casein and oxide of zinc, both of which are extremely injurious if taken into the system. A solution of sugar, left to stand a few hours in a zinc vessel, will be found to contain a considerable quantity of salts of that metal.

**FOR NEURALGIA.**—Take two large table spoonfuls of cologne and two teaspoonfuls of fine salt; mix them together in a small bottle, every time you have an acute affection of the nerves, or neuralgia, simply breathe the fumes in your nose from the bottle, and you will often be immediately relieved.

**A BEAUTIFUL NEW PORCELAIN GLAZE.**—A double chloride of platinum and aluminum, obtained by dissolving the metals together in aqua regia (nitro-muriatic acid) is mixed with fine ground Limoges glaze, (a potash alumina glass) as well as with other enamels, producing a variety of beautiful effects. The first named gives a remarkable metallic luster and iridescence in the enamel.

**GREENLAND.**—Mr. Edward Whymper, the Matterhorn climber, and Mr. John Browne, the Rocky Mountain hotanist, have started from Copenhagen on a tour through the interior of Greenland, in the interest of science, and at private expense.

**STRENGTH OF DIFFERENT KINDS OF WOOL.** Fine wool is decidedly stronger in proportion to diameter than coarse wool; and if spun into as large threads as those of coarse wool, which are employed in heavy common cloths, would make a fabric more than three times as durable as the latter.

**SOUND UNDER WATER.**—A bell rung under water has been heard across the breadth of the lake of Geneva, a distance of nine miles.

**NO BUGS.**—It is said that the little bugs which have so annoyed the lovers of raspberries for a year or two past in this vicinity, have not made their appearance the present season; so that people need not be nervous about eating this delicious fruit.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

63,923.—GANG PLOW.—J. W. Sursa, San Leandro, Cal.

I claim, 1st: The combination and arrangement of the shaft, c, the segment arms, d, d', the axles, g, g', of the wheels, D, D, the hand-lever, h, and the rack, k, for raising and lowering the gang plows, A, A, substantially as herein described.

2d: The arrangement of the draught-pole, F, pivoted to the plow-beams, B, B, and depressed and elevated by the screw, a, substantially as for the purpose set forth.

64,894.—DOOR INDICATOR.—F. E. Mills, San Francisco, Cal.

I claim, 1st: The reversible hox, h, provided with the lettered cover, c, having the hole, h, and the revolving disk, P, said hox containing a series of lettered or blank disks, S, S, adapted to be placed in the sink, t, in the reverse end of said hox, substantially as described for the purpose specified.

2d. The reversible hox, h, in combination with the door glass plate, circular plate, A, having circular opening, B, and semi-circular opening, D, substantially as described for the purpose specified.

65,087.—IMPROVEMENT IN GANG-PLOWS.—Joseph Ingham and James Ingham, of San José, Cal.

What we claim is: The movable piston bars, C, C, with the segments, D, D, wheels, E, E, and pinions, F, F, to raise and lower the plows, substantially as described.

2d, The two-part axle, G, with the vertical connecting-racks, K, K, to make the plows cut to an equal depth, as described.

3d, The eyes, L, L, together with the bar, M, and screw, m, for the purpose of regulating the draft, substantially as described.

The object of this invention is to provide a gang-plow so constructed that the plows may be regulated by the operator from his seat. This is effected by geared wheels and segments for raising and lowering the plows, and regulating their height by an adjusting screw; also, a toothed connection of the axle, that, although the furrow-wheel may be the lowest, the axle will be horizontal; also, to a device for shifting the draft connection from right to left, the whole being attached to a suitable frame mounted on wheels.

65,090.—PUNCHES FOR CAR TICKETS.—Robert J. Kellett, San Francisco, Cal.

What I claim is: a punch, with an attachment, E, or its equivalent, for holding the clippings or chips of tickets, in the manner substantially set forth and specified.

The object of this invention is to provide an improved mode of ascertaining the number of passengers who ride in a public conveyance, the number of fares taken, and the number of tickets sold—or, in other words, to provide for a check on forgetful or dishonest conductors. The device contemplates the use of a series of tickets, combining a number of fares in one, each of which will be indicated by a hole in the ticket until it becomes forfeit. The conductor receives no money unless he gives a ticket, and when he reclaims the ticket, must punch a hole in it, the cuttings of which fall into a box connected with the punch, which is kept locked, and by which cuttings he afterwards settles with the clerk. Different colored cards may represent different prices, etc.

## RECENT INVENTIONS.

AN HYDRAULIC INVENTION.—The Dutch Flat Enquirer says that Mr. Richards, of Michigan Bluff, has recently invented a machine which is likely to create a complete revolution in hydraulic mining, as it is claimed by the inventor to supersede the hose method of conducting the water. The machine is attached directly to the pipe, and by it the stream of water is easily directed in any required direction. The North American Company, at Michigan Bluff, are now using the machine, and are said to be greatly pleased with it. It is said to be cheap and easily managed.

ELECTRICITY IN GOLD SMELTING.—It is reported that a Mr. Adams of Boston, has discovered a method of employing electricity

as an aid in a smelting process for gold, whereby the yield is said to be greatly increased. The inventors claim that the gold exists in such a state that fire will not develop it without the aid of electricity. The claims are so extravagant, however, as to awaken a very reasonable doubt as to whether there is anything whatever of value in the alleged discovery; but the recent and reported successful application of electricity to the purification of cast iron, referred to in another column, will doubtless attach interest to the above announcement as something within the bounds of possibility.

FIELD'S PULVERIZER.—Mr. J. B. Fields, of Jersey City, N. J., has patented a device for crushing and pulverizing, which consists of a rotating cylinder, the inner surface of which is provided with a chilled cast iron or other hard substances for a crushing surface, said cylinders being provided with openings at its sides which are covered with screens and having within it a rotary crusher or pulverizer, the periphery of which is also of chilled cast iron or other hard substance. The crushing or pulverizing surfaces of the hollow cylinder and the crusher within it are of V-form and the former moves rather further than the latter in order to obtain a grinding action, all being so arranged that substances, however hard, such for instance as gold-bearing quartz, may be reduced or pulverized in a perfect manner.

FLINT'S IMPROVED GATE.—Daniel Flint, of Sacramento, has invented a model gate, which can be opened and shut by a person without stepping from his carriage or dismounting from his horse. The principles of the invention are simple, yet ingenious. On the gate being opened by a line attached to a post stationed a short distance from the point to which the gate swings, it is fastened by a self-adjusting latch, and is shut in the same way. A patent has been asked for not only the invention of the gate, but for the latch and the eccentric leverage which is attached to the post on which the gate is hung. Mr. Flint has a gate fashioned after this model on his ranch, near Sutterville, which has been in successful operation for some two months. It can be used with and against the highest wind.

A DARNING MACHINE has been invented, and the greatest wonderment attending it is the fact that the inventor is an Englishman, and not a Yankee! A cotemporary consoles himself, however, with the idea that some Yankee will so improve upon it as to render his idea the principal thing of value about it. The invention is by Mr. E. A. Cowper, of London, and consists of the use of a small rectangular frame, large enough to enclose the hole to be darned, and notched all around its outside, like a saw, and upon which the darning cotton or yarn is wound, in two directions, crossing each other, with a thread in each notch, until the hole is covered. The net-work is then applied to the hole; the article stretched upon the frame and held by its teeth; the whole is then placed beneath the needle of a sewing machine, and the thing is done at once. When done, the frame is cut away and the threads trimmed off close. Surely some Yankee ought to have thought of so simple a thing.

A GAUGE-COCK WHISTLE.—A novel, if not important invention, is announced, which is termed a gauge-cock whistle, which can be attached to any ordinary gauge-cock, and which will, when the cock is opened, produce a whistling sound if steam escapes, a bird-like note with foam, and no sound at all with water. By this device not only the engineer, but all within near vicinity, will be promptly informed whenever the gauge-cock hetokeus danger.

SAFETY BLASTING POWDER.—Tehleisen, a chemist of Wurtemberg, has patented a blasting powder which he calls kaloxilin, and which is not exploded by a blow, a shock, or friction. The carbonaceous ingredient is cellulose, prepared from sawdust of hard non-resinous woods, nine parts, with three parts of charcoal and forty-five parts nitrate of potash.

E. POWER, wood carver and ornamental designer, may be found at Nos. 311 and 313 Market street. Mr. Power executed the ornamental work on the Merchants' Exchange, the Court House at San José, on Stanton's Building, Kearny, near Post street, and on numbers of others of our best structures, public and private. He is one of the best artists in his line on this coast, as his works abundantly testify. See his card in another column.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,  
JUNE 29, 1867.

## MINING SHARE MARKET.

The mining share market continues to be characterized by marked activity, and during the past week a material advance has taken place in most leading shares. Several companies have recently been added to the list of the Board; meetings of others long dormant have been advertised; and, generally speaking, the future prospects of the claims on the Comstock lode have never been better.

SAVAGE—has been firmly held, and only a few feet changed hands at enhanced rates, advancing rapidly from \$4,275 to \$4,480, and at the close realizing \$4,490. The approximate value of the 2,291 tons of ore extracted during the week ending June 22d is stated to be \$93,363, or \$40.75 per ton. Of this amount, the north mine, on the 7th level—the breast of which are said to look as well as ever—yielded 1,335 tons. The drift from the 6th station toward the new "Potosi strike" has been started, and the favorable developments at this point have been carried some distance further north in good ore. In the northeast drift from the third station, sixty feet east of winze No. 2, good ore was found on the 25th inst. The receipts of bullion for the current month will be fully as large as in May.

CROWN POINT—has gained great confidence, and sold at a marked advance over our last quotations, steadily improving from \$1,815 to \$2,330 per foot, and closing yesterday at \$2,250. The east vein on the 500-foot level has been opened to a distance of 73 feet, and in raising up on this body of ore some 20 feet, the developments continue very favorable. The west drift on the same level is in 190 feet. The timbers have been placed for the 600-foot station, and drifting will be commenced the present week. During the week ending June 21st, 647 tons of ore were raised from the mine, showing an average value of \$35.78 per ton.

YELLOW JACKET—fluctuated considerably, rising from \$1,650 to \$1,750, receding to \$1,690, improving to \$1,720, and closing at \$1,660. We have no information in regard to the condition of this mine.

GOULD & CURRY—shows considerable animation, advancing from \$635 to \$705, and at the close selling at \$715. The following statement of receipts and disbursements, from Dec. 1st, 1866, to June 12th, 1867, has been kindly furnished us by the Secretary:

RECEIPTS.	
Cash on hand, Dec. 1, 1866.....	2,698 45
Bullion account.....	452,890 15
Sundries.....	5,976 03
	\$461,649 63
DISBURSEMENTS.	
Paid amounts due as per annual report.....	14,832 91
Mine labor, materials and freight.....	177,309 96
Mine labor, materials, hauling etc.....	24,867 50
Reducing ores at custom mills.....	50,653 37
General expenses.....	15,304 83
Freight on Bullion, taxes, etc.....	19,121 63
Legal expenses, exchange, etc.....	9,432 70
Cash on hand, June 12.....	53,976 83
	\$461,649 63

The liabilities amount to \$10,145. The ore product for the above period aggregated 13,410 tons; amount reduced, 14,540½ tons. The mine has not changed in appearance for a long time. The east drift, from north branch of fourth station, is still in porphyry, but it is not mixed with gypsum, and can be more easily worked.

KENTUCK—rose from \$525 to \$560, and closed at \$452.50, h 30. The new level recently opened 165 feet below the surface, is said to be improving as the developments continue, and the third floor which is now being opened, exhibits a better quality of ore than was found on the station level. The average product of the mine for the current month has been eighty tons of ore per day, showing a yield of \$55 to the ton. From the 19th to the 24th inclusive, \$30,785.80 in bullion were received at the office in this city, which, added to the previous returns in the present month, swells the receipts to \$76,648.52.

CHOLLAR-POTOSI—has been less active than for some time past, receding from \$475 to \$450, rallying to \$460@467.50, and closing at \$450. We learn of nothing of especial interest from this mine. The shipments of ore to custom mills during the week ending June 22d, amounted to 2,773½ tons. The bullion returns for the current month will fully equal the receipts of May....

BELCHER advanced steadily, with increased sales toward the close, from \$440 to \$550, and closed at \$500.

OPHIR—advanced from \$295 to \$385, s. 30, receded to \$320, rallied at \$345, and closed at \$322.50.

OVERMAN—continues the most active stock on the list, but at declining rates, and is held with less firmness than at the beginning of the week, improving from \$210 to \$275, receding to \$190, and closing at \$205. A number of telegraphic dispatches have been received at the office in this city, from the acting superintendent, Mr. McCullough and Mr. Curtis, the gentleman lately appointed by the majority of the Trustees, who is now endeavoring to obtain possession through the courts, relative to the disputed rights of the several parties. By late advices, we learn that the hearing of the case has been postponed until July 3d. In regard to the present condition of the mine, Mr. McCullough says that the ore course, both on the 350 and 450 feet levels, shows good bodies of sulphurets and native metal; and that the 350-foot level is being carried east through fine ore, and the 450-foot level south, with a breast of 20 feet in width, 15 feet of which it is thought, will mill about \$45 per ton. They extract at present 30 tons of ore per day. So far as we can learn, the developments are pronounced to be of a permanent character.

IMPERIAL—has been very steadily maintained at \$195@200, rallying to \$210, and closing at \$217. The receipts of bullion from the 1st to the 26th inst., amounted to \$52,364.65, as compared with \$40,772.43 received during the same period in May. From the annual report for the fiscal year ending May 31st, 1867, we obtain the following facts: Value of bullion received during the year, \$1,060,054.10, being the product of 40,878½ tons of ore, 29,616½ tons of which yielded an average of \$28 to the ton, and 11,262 tons an average of \$20.49 per ton. The cost of working 28,990 tons of ore, (including charges for hauling from mine to mills), was \$9.48½ per ton, and 11,870½ tons at \$7.84½ per ton, showing a decreased expense of \$1.84 per ton, as compared with the two preceding years. The mining expenses of 29,616½ tons, averaged \$4.36 per ton, and of 11,262 tons, \$3.54 per ton. During the year closing with May 31st, this company disbursed \$396,000 in dividends, as against \$240,000 in the previous year.

GOLD HILL M. & M. Co.—sold at \$240@220.... CONFIDENCE at \$70@62.50, closing yesterday at \$62.50.... BULLION at \$42.50@30.... JUSTIS AND INDEPENDENT CONSOLIDATED has been recently placed on the market, and sold during the past week at \$45@20 per share. This company was incorporated May 19, 1866, consists of 3,000 shares at \$100 each, and the mine is located in the Gold Hill District, Nevada.

SEGREGATED BELCHER—placed on the market within the past week, has been sold to a large extent, ranging from \$30 to \$13 per share, and closing at \$16.50. We are informed that the west drift, on the 200-foot level, shows a large body of ore which will average \$20 per ton. On the west drift, from the 400-foot level, the ledge is forty feet wide, extending the whole length of the mine, and connects with the 200-foot level, the ore averaging from \$22 to \$26 per ton. The same body of ore is found on the 500-foot level, averaging from \$30 to \$35 per ton; and in running east 112 feet on the 600-foot level they reached water, the pump not being of sufficient capacity to drain it; later the Overman and Belcher Companies have drained it. No work has been done for eight months, and previously \$182,000 were extracted in the course of nine months, showing an average of \$24.15 per ton. Operations will be resumed in a few days, and three mills will be employed for the present. There are 160 feet in the mine, and 40 shares to the foot, comprising 6,400 shares.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,554,206.

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by

N. H. WOODS,  
No. 23 Third street.

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint.

16-14 3m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, an application, in person or by letter, to

AUSTIN A. WELLS, Agent.

## Home Trades and Manufactures.

THE PACIFIC FILE FACTORY commenced operations at No. 53 Beale street about ten months ago, under the management of Messrs. Durning & Fisher, both practical mechanics and workmen, and bringing with them an experience of many years gained in this line of business in the older States. This is the only establishment of the kind on the coast, and is now in successful operation, giving employment to some eight or ten men at an average of \$4 per day to the man.

In addition to the business of manufacturing new files, a full assortment of which are constantly on hand, they are extensively engaged in re-cutting old files, which, after coming through their hands, are acknowledged to be equal to the new imported files, and at a saving of nearly fifty per cent. in their cost. The process of re-modeling is similar to that used in the manufacture of new files. After first being properly annealed, the teeth are ground off; the old file is next re-cut, tempered, and finally reappears as good as new. We understand that the manufacture of reaper and mower sections, to any extent, is also a new branch of business here. We are pleased to learn that this establishment is provided with all the necessary machinery to turn out this class of work as cheap as at the East. This is another step in the right direction. The energy and enterprise of this new firm are certainly deserving of commendation and all due encouragement, and we are gratified to learn that they have received the patronage of the leading foundry and machine shops in this city.

BOWMAN'S WASHING COMPOUND, A. D. Bowman & Co. patentees, is an article recently introduced here from the East, to be used in connection with soap, or as a substitute for it in dish-tub, bath or laundry. It purports to contain no lime or other ingredients injurious to clothes. It is claimed for the compound that it softens the dirt, dispenses with much unnecessary rubbing and the consequent evil results in the process of washing. It also removes paint or grease spots from wood or clothing, and is adapted to any kind of goods and to either hard or soft water—in fact, rendering the former, it is said, as soft as the purest rain-water, saving much time and labor in both kitchen and laundry. Manufactured by Lynch & Parsons, at 128 Fifth street.

**OIL CAKE.**—A large amount of oil cake is being constantly turned out at the Linseed Oil Mill, near the foot of Third street, which might be economically used as food for milk cows and other animals. It is sold at \$30 per ton. About 100 tons are now being shipped to England, where it is in great demand for stock.

**INSURANCE.**—The Peninsular and Oriental Steam Navigation Co., of Great Britain, up to 1848, insured their fleet at Lloyd's, at a cost of 6½ per cent. Since that time they have become their own underwriters, and their losses have not exceeded 1½ per cent. The charge at Lloyd's is probably not in excess of that required to do a safe business. The difference between that charge and the actual loss of the company referred to, who have a fleet of fifty-three large steamers, in addition to more than twice that number of tugs, transports, coal ships, etc., is merely the difference in care and attention between a large company well equipped and drilled for such emergencies, and individual parties, who, feeling no responsibility, are reckless or careless.

A SCIENTIFIC PROFESSORSHIP is to be established in the College of California at Oakland. The chair will be filled by Mr. Rising, a graduate of Hamilton College, and of the scientific school of the Michigan University. He will act as Professor of Chemistry and Natural Science.

## MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:  
**AMERICAN M. Co.**—State of Nevada, June 27th. Capital stock, \$580,000; 2,900 shares, \$200 each. Trustees: A. K. P. Harmon, Thos. H. Holt, L. Weller, E. B. Holmes & S. Heydenfeldt. President, Thos. H. Holt; Secretary, David T. Bagley.  
**PIONEER SILK FACTORY.**—San José. Capital stock, \$250,000. President, T. E. Lindenberger; Treasurer, A. Unger; Secretary, A. Martineau; Superintendent, J. Newmann.

**THE KEYSTONE QUARTZ M. Co.** have filed notice of their intention of removing their office from Downieville, Sierra county, to this city.

## THE CENTRAL PARK OF THE PACIFIC.

**Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, ZOOLOGICAL GARDENS.**

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic. To all departments new attractions are being constantly added. These Gardens are accessible by the Howard, Folsom and Market street Cars. Entrance on Mission and Valencia streets, between Thirtieth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 CENTS. Children, under 12 years, half price. 25v14qr

**ELECTION OF OFFICERS.**—IMPERIAL S. M. Co.—Storey Co., Nevada, June 15th. Trustees: Wm. B. Bourn, William Carman, J. E. de la Montagnie, John Sime, John Barton, Wm. H. Sharp, and H. F. Cutter. President, Wm. B. Bourn; Vice President, J. E. de la Montagnie; Secretary, D. A. Jennings; Superintendent, J. D. Greenree. Office, corner California and Sansome sts.

Following, we give the list of present officers of several companies, the report of whose meetings we failed to receive at the time:

**CHOLLAR-POTOSI Co.**—Storey county, Nevada. Trustees: A. K. P. Harmon, C. Hosmer, M. C. Hilley, Lloyd Tavis, Wm. E. Barron, A. C. Peachy, B. F. Sherwood. President, A. K. P. Harmon; Secretary, W. E. Dean; Treasurer, Wm. C. Ralston; Superintendent, Harvey Beckwith. Office, 706 Montgomery street. The annual election of this company takes place on the 8th of July next.

**CONFIDENCE M. Co.**—November 8th, 1866. Trustees: Geo. W. Stewart, S. B. Whipple, Wm. L. Palmer, W. Surryhne, Fred. Collier. President, Geo. W. Stewart; Secretary and Treasurer, R. Wegener; Superintendent, J. B. Dayton. Office, 415 Montgomery street.

**EXCHQUER M. Co.**—Storey county, Nevada. Trustees: S. Heydenfeldt, A. K. P. Harmon, A. P. Crittenden, Thos. Sunderland, A. K. Grim. President, S. Heydenfeldt; Secretary, D. T. Bagley; Superintendent, Joseph Low. Office, 712 Montgomery street.

**GOLD HILL Q. M. & M. Co.**—Storey county, Nevada, January, 1867. Trustees: Ottoviano Gori, P. G. Venard, L. Imhaus, B. Dolheguy, A. Levy. President, Ottoviano Gori; Secretary, R. Wegener; Treasurer, P. G. Venard; Superintendent, H. Huguet.

**HALE AND NORCROSS S. M. Co.**—Storey county, Nevada. Trustees: George S. Mann, M. Morgenstau, C. L. Low, Erwin Davis, Geo. Wallace. President, Geo. S. Mann; Secretary, Joel F. Lightner. Office, corner Washington and Montgomery streets.

THE BANK OF CALIFORNIA took possession of their new and splendid building, at the corner of California and Sansome streets, on Thursday last. This act forms quite an important event in the financial history of our city. It is a noticeable fact that we have, among many similar institutions in this city, a single bank whose paid-up capital amounts to five millions of dollars in gold coin, besides a surplus of \$600,000 of profit, after paying handsome dividends; and that the edifice in which it is located is the finest, most elegant, and most costly of its size in the world. The idea is very naturally suggestive of the sound and healthy financial condition and prospects of the growing commercial metropolis of the Pacific coast. The architects of this building are Messrs. Kenitzer and Farquharson.

**WOODWARD'S GARDENS**, with its rare assortment of birds and animals, its cabinet of minerals, gallery and museum, will afford pleasure and profit to all. Miners and others from the interior should not fail to see the wonders displayed here in such beauty and variety.

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14tf

**FOUNDRIY FOR SALE.**  
 A One-half Interest in the  
**UNION IRON WORKS,**  
 SACRAMENTO,  
 Owned by William R. Williams, is offered for sale on the most favorable terms.

**A Good Bargain**  
 May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.  
 Inquire at the office of the Foundry, or address  
 WILLIAM R. WILLIAMS,  
 26v13tr-16p Sacramento, Cal.

## A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the Mining and Scientific Press, or address DEWEY & VAUGHN, Mountain Messenger office, Downieville, Sierra County, Cal. 7v14tf

## MECHANICS' INSTITUTE.

## Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM of ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.

The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1868, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.

Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity.

The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear, legible writing, so as to admit of easy reading.

The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges: Hon. Fred'k F. Low, Maj. Gen. H. W. Halleck, U. S. A., Prof. J. D. Whitney, S. A., James Oils, Prof. W. B. Ewer, Wm. Governor Morris, B. N. Bugbey.

By order of the Board of Directors. D. E. HAYES, Secretary. San Francisco, June 12, 1867. 2v14-2m

## W. T. GARRATT, City BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts., SAN FRANCISCO.  
 Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings:  
 CHURCH AND STEAMBOAT BELLS,  
 TANKS AND HAND BELLS AND GONGS,  
 FIRE ENGINES, FORCE AND LIFT PUMPS,  
 Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZLES.  
 For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."  
 Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6tf

## E. POWER, WOOD CARVER

—AND—  
 Composition Ornament Manufacturer.  
 Designing, Modeling and Patterns FOR CASTING.

INTERIOR DECORATIONS OF ALL DESCRIPTIONS, In Wood, Composition and Metal.  
 Nos. 311 and 313 Market street, San Francisco. 25v14-qy

ISAAC R. NATIS, HENRY COWELL, DAVIS & COWELL, DEALERS IN  
 Santa Cruz Lime, Cement, PLASTER, HAIR, LATH AND LATH NAILS.  
 Marble Dust, Fire-Bricks, Fire-Clay, Fire Tiles of all sizes. Cor. Front and Washington Streets, San Francisco. 25v14-tf

## HAYWARD, COLEMAN &amp; CO., IMPORTERS AND REFINERS

—OF—  
 Illuminating, Lubricating, PAINT OILS!

—CONSISTING OF  
 KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO—  
 SPIRITS OF TURPENTINE & ALCOHOL.

Notz.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.  
 A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

**Lamps and Lamp Stock!**  
 An elegant and complete assortment on hand. 5v13-3m19 414 Front street, San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

Without grumbling, we will say outright that some of our exchanges reach us several days overdue, and frequently after we have seen extracts from them in the daily press of this city. Full credit is given in our mining summary to every interior journal. The papers are wanted as early in the week as possible. Put us at the top of the file, gentlemen, and if the P. M.'s neglect their duty, woe be unto them hereafter.

## CALIFORNIA.

## Alpine County.

*Miner*, June 22: The ore-house of the Tarshish mine, lately completed, is 40 feet long, 20 feet wide, and 30 feet high.

The mine is now being chambered out at the point where the rich body of ore was found, and drifts run north and south on the vein. In a few days the tunnel will be pushed ahead in the face.

## Amador County.

*Ledger*, June 22d: The Oncida mill is again in full blast—the new engine just up working admirably; and the company expect to be able in future to obtain greater yields than ever before from this mine.

Rich quartz has lately been struck near the Butte. We are not at liberty to give particulars.

The quartz mines of this county were never in a more prosperous condition than at present; new discoveries are being made weekly.

## Colusa County.

*Sun*, June 22d: The Lyon Copper Smelting Co. have made a failure in their works. Their furnace would smelt the copper, but they could not succeed in running it out. The ore is rich enough to pay, and in sufficient quantities. The company have levied an assessment of one dollar per share, for the purpose of purchasing and erecting a Haskell furnace.

## Nevada County.

*Transcript*, June 22d: The snow at Fall Creek is all gone, and miners are resuming work on their tunnels. At Red Dog and You Bet about 300 men are at work.

Considerable prospecting for quartz is being done in the vicinity of the Anthony House, Pleasant Valley. Last week another new and promising ledge was discovered and located in this neighborhood. A shaft is to be sunk immediately for the purpose of prospecting.

The mine owned by Cozzens & Garber, on Missouri Cañon, between You Bet and Red Dog, has been recently sold to Neece & West, experienced cement miners, who will proceed immediately to work the mine.

June 23d: The Golden Gate Co., at San Juan, cleaned up on Thursday last, and took out \$7,000. All the companies on San Juan Hill are doing first rate.

June 25th: Ten or twelve companies are at work on Deer Creek, where the blue gravel channel crosses near the Cascades. The North Star Company has struck first rate gravel. Last fall some gravel was taken out that paid from \$10 to \$30 to the pan.

June 26th: From an assay of six pounds of rock from the Grizzly ledge, at Devil's Cañon, made by J. J. Ott, \$105 in gold was obtained. These sulphurets were taken from the blanket washings.

*Gazette*, June 20th: At Blue Tent the gravel channel is over 2,000 yards in width, and of unknown depth. The banks of the Enterprise Co.'s claims are 260 feet high, and the bed rock is known to be a considerable distance below them. The Killam Co., of San Francisco, employs five men and 120 inches of water. The company owns 1,800 feet of ground front, and 5,000 feet back.

A company from Timbuctoo has recently purchased the Hawkeye and Washington claims, and intends opening them this summer.

*National*, June 19th: The Wiseonsin Co. are now working for the third level, and have struck a rich ledge varying from one to two feet in width. About \$400 worth of rock has been taken out, after putting in a blast. A great deal more of the same sort is in sight, and will be brought to the surface as soon as the workmen can get at it. The company owns about 5,100 feet.

June 22d: The Cambridge mine at Union Hill, at the depth of 230 feet, struck a ledge some 2½ feet in width. The rock shows gold very plainly.

Grass Valley Union, June 15th: At Eureka South, the Jim and Black & Young quartz mills are running with good results, and two arastras are also engaged in crushing rock. The Commercial, a San Fran-

cisco company, has made arrangements to construct a quartz mill on the company's mine, the machinery of which is now en route for Eureka South. The Birchville Co.'s mine is looking splendidly, and at a depth of fifty feet a strong vein four feet in width is exposed.

The Birchville Co. design erecting a mill soon on their mine, which is at the South Fork, Eureka district.

June 20th: A fine looking vein, showing plenty of free gold and rich sulphurets, was recently struck in the Ione.

*Excelsior*.—Meadow Lake *Sun*, June 22d: The Kentucky Co. have commenced work on their mine. They are running in an open to the ledge, and as soon as they have reached it they will begin to sink upon it. It is the intention of the company to erect a mill on their ledge before the present summer has passed away.

Many of the claims of this district are preparing for work. In the course of the next thirty days 500 men will be employed on our mines.

Some splendid looking rock was taken from the Pine Tree Co.'s claim, on the Live Oak ledge. The more this ledge is prospected, the better it promises. Many good miners think it one of the richest leads in Excelsior.

The Comet Co. has commenced work on the Shooting Star ledge. Returns from two different assay offices of ore from this ledge give from \$150 to \$680 per ton, gold. The claim is also rich in copper.

Some fine ore from the California Co.'s claim were shown a few days since, containing a considerable quantity of free gold mingled with sulphurets.

The mill of the Golden Eagle Co. is now running, and they are crushing some very fine looking rock, but we cannot with propriety make any estimate of the results.

## Placer County.

*Dutch Flat Enquirer*, June 22d: Since the result of the crushing by the mill of the King Brothers has become known, quite a number of strangers have been in town, doubtless with the intention of becoming interested in the many cement claims in this place.

*Courier*, June 21st: Rich rock from the Shepherd mine is as regular as the mails. The pieces taken out last Saturday weighed in the aggregate ten pounds, some pieces containing over a pound of gold. Mr. Shepherd has thus far worked 125 tons of rock, and has, from the proceeds alone, erected a mill and thoroughly opened the mine.

## Plumas County.

The Plumas correspondent to the *Marysville Appeal*, of June 25th, writes from Nelson Point: The mines are fluctuating—some improving; others having failed. Beesy, near Argentine, has been making about \$6 per day. Cook & Co., Bonner & Lee, Capt. Hull & Co. are now scarcely making expenses. Squire, Stevens & Co. have got through ground-slueing, and expect to do well. What washing up they have done has paid them \$6 per day. Frank Kane, on the adjoining claim, is still ground slueing. Richards & White, on Sawmill Point, have been averaging \$6 per day. Messrs. Jackson, Jolly & Mitchell, near the Willow Ranch, are running their ravine claim night and day. It prospects better than it ever did before. A little dirt, taken from the ground slueing, and panned out on a shovel, produced \$1; part of a pan full, scooped up from the water at the head of a displaced riffle, \$35. They expect to clean up \$25 or \$30 per day to the man.

Last week the Eagle Co., Sawpit Flat, cleaned up 535 ozs. They think there is yet between \$2,000 and \$3,000 in the ground slueing.

## San Bernardino County.

*Guardian*, June 22d: The steam pump works in Holeomb Valley work admirably. A flume has been constructed 275 yards long, and a shaft sunk in a flat which heretofore could not be penetrated. E. G. Moore, at the Green lode, is working four arastras. The ore at the bottom of the shaft works \$50 per ton.

Gold-bearing quartz is said to have been discovered in the valley of San Jacinto.

At Prescott, the Big Bug Co. has erected furnaces for roasting, and will commence crushing this week.

The Umpqua mill will commence work as soon as they get their new machinery up.

In addition to the mills, there is a number of arastras in the various mining camps, which have been doing well.

## Sierra County.

*Yreka Union*, June 22d: At Mugginsville, Hollenback & Co. washed up last week \$2,400 after a two weeks' run. The Oro Fino claims are paying well. Hice & Co. washed up about \$3,000 last week. Anderson, Clark & Co. are opening claims in the

flat below the celebrated Wright claims, that have paid so well for the past five years.

## Yuba County.

*Appeal*, June 20th: The Pennsylvania mine, at Brown's Valley, is crushing very fine rock. It will not be long before the company will declare its first dividend.

## ARIZONA.

*Arizona Miner*, June 1st: The Moss mill has lately been crushing ore from the Moss mine with highly satisfactory results. Some 300 tons of ore are now in sight. W. H. Hardy is getting good ore from his shaft on the Parsons. The vein improves as it goes down.

At Turkey Creek 24 men are employed, running tunnels on the Bully Bueno and Yahoo lodes. On the former the tunnels are respectively 75 and 175 feet in length. The former will, at twice its present length, strike the lode at the depth of 300 feet. The tunnel on the Yahoo is now 75 feet in length, and will be extended to 150 feet. The lodes appear large, and the ore of the Bully Bueno is evidently turning to silver. The Vulture mill is working successfully.

## COLORADO.

*Georgetown Miner*, May 30th: Very fine ore has been struck in the new Boston lode. Messrs. Cree and Pierson let a contract on Monday last for sinking on a lode in Columbia Mountain, situated near the Nuckolls lode. The vein at the surface shows a fine white crevice, with good indications of rich ores. Several parties are taking steps to secure United States titles.

Mr. J. Watson is about to erect works in two places in the district, introducing in each the California process now so successful in the hands of Messrs. Reese, Krause & Brueker, of Black Hawk. It is also on dit that Mr. Watson is about to build for himself a splendid family domicile in Georgetown, he having purchased lots for that purpose last week. The first button from Johnson's furnace was taken out on Monday last. It weighed thirteen pounds, and was cupelled from lead run out by Mr. Stowell's furnace last year. The button is worth \$325. Very promising results are obtained from the Watertown lode. Many discoveries of rich silver lodes are being made daily in the vicinity of Downieville, and near the head of Fall River. A specimen of ore weighing eighty grains, taken from the Bethany lode, and assayed by Mr. Burlingame, returned a yield of silver over fifty per cent. The Bethany is opening up very finely, and bids fair to prove one of the very best lodes in this district. Dr. Johnson's second button of silver will weigh not less than two hundred pounds. The Georgetown Tunneling Company have commenced work, and already have struck some good indications within ten feet of the mouth of the tunnel. Mr. Guittens, the contractor, is confident that within three months the amount of rich ore that can be taken out at the tunnel will put a stop to all assessments and declare dividends. C. A. Martin, Esq., is putting up a furnace in Col. Wm. H. Hale's mill, using the same style of furnace as that of the firm of Krause, Reese & Brueker, for the purpose of chloridizing silver ores, now in operation at Black Hawk. After roasting by the method named, the metal is amalgamated by the old process of the Freiberg barrels. The furnace will run on custom ores. The capacity of the mill is four tons in twenty-four hours. They will be ready for work in about two weeks.

## IDAHO.

*Owyhee Avalanche*, June 15th: A new ledge has been discovered near Idaho City, which is believed to be a second Poorman. It has been christened the Potosi. The ledge is one foot wide, containing free gold and native silver, easily cut with a knife, and the whole mixed with black sulphurets. The ledge has the appearance of a true vein.

The Poorman Extension Co. is enlarging operations. Besides sinking a shaft, a tunnel has been commenced at the head of Webfoot Gulch, which is to be run 70 ft. south, to connect with a shaft near the south line. The mill of the Owyhee M. Co. is undergoing repairs, and is expected to begin operations in a few days.

The Minear mill is undergoing repairs. A lot of Whiskey Gulch ore has been roasted for crushing in the mill.

Black, in Flint Dist., has got his mill to running, and is turning out bullion from the Rising Star mine. Some rich discoveries of ledges are reported, and old ones developing richer. The Leviathan is yielding quartz beautifully tinted with ruby silver. Chas. Liebenau has his smelting and concentrating works nearly ready for experiments—the immediate design and capacity being only intended for practical experiments, the first of which will be made with ore from the Leviathan. The ore will first be crushed in Black's mill and afterwards concentrated.

June 22d: The following is the result of the Poorman mine, worked in the different mills, from July 19th to Nov. 1st, 1866:

Name of Mill.	Tons Ore.	Ozs. Bullion.	Value.
N. Y. & Owyhee	380	17,460 17	\$255,683 59
N. Y. & Oro Fino	771½	126,763 91	203,686 71
Ainsworth	362½	33,178 82	62,220 81
Jackson (Webfoot)	569½	7,223 29	25,200 58
Total	2,382½	305,215 89	\$546,691 59

Average yield, \$229.45 per ton, and the entire cost for mining, milling, etc., \$66.07 per ton.

The Morning Star mill is at work on Oro Fino rock.

*World*, June 15th: The Bummer Hill claims, of Sam. Sniveley & Co., near Centerville, are doing well. It seems that their gold product is exhaustless. Water is furnished by the Ditch Co., from Grimes' Creek, above Pioneer City.

The first clean up in the claim of B. F. Channell, Bahoon Gulch, yielded \$1,240. Another partial clean up, after a three days run, yielded over \$800.

A clean up of the claims of Casey, White & Co., and the Highland & Murphy claim, on Bonner Hill, yielded very rich. Cannally & Co. got 150 ozs. from a six days' run, and Wash. Underwood's claim has been paying handsomely.

A clean up of two cuts in the claims of Noble, Sanders, & Co. on Buena Vista Bar, after a week's run, gave \$5,700.

Lemhi is about "played out," the excitement has subsided, and the great question now is how to get away. A letter from Blackfoot City to the *World*, says that there are only three good gulches which have claims on them, some paying from \$5 to \$15 to the hand. But they are all on the sell, not a very promising sign.

Same of 19th says the third clean up of the season was made at the quartz mill of the Elkhorn Co., last Saturday, and from 70 tons of ore the gold produced was 410 ozs. Many of the Basinites who went or started to Lemhi, are returning to Boise.

*Lewiston Journal*, June 1st: Times at Warren's Diggings are good. Bemiss, Grayham & Noon, Hammond & Co., and Wm. George are all pipping. The creek claimants are mostly all ground slueing.

A letter from "49" Creek says that rich diggings exist there, sufficient for the employment of 1,500 miners.

The Boise *Statesman* says that an astonishingly rich gold bearing ledge has been struck on War Eagle Mountain; thought to be equal to the Poorman. The finders have been offered \$20,000 for their chance. The *Bullion* says that a chunk of gold worth \$3,000 was taken from the ledge.

## MONTANA.

*Post*, June 8th: Montana Bar, in Confederate Gulch, contains but seven claims, each 200 by 250 ft., from which, in the space of three months after discovery, over \$1,000,000 in dust was taken. Now nothing but the bare, cleanly scraped, rough slate bed-rock marks the spot. Boulder ditch, 4½ miles long, is five ft. wide by 2½ deep, capable of accommodating 2,000 in. (miners' measure). An iron pipe, 22 in. in diameter, will conduct the water from one hill to the opposite one 400 ft. high. Two more ditches have been surveyed, one seven miles long, from Duck Creek, east of Diamond, is commenced. The other, 25 miles long, will take its water from Deep Creek, a large tributary of the Missouri.

The Gaston & Simpson Co's mill, in New York Dist., will soon start on ore from Heald & Toole's Gold Mountain lode, and should the yield be as anticipated, will probably purchase the ledge.

*Helena Gazette*, June 8th: John Hannon, J. Smith, M. Welch, P. Gillespie and J. Cumeske, of Diamond City, are now actively engaged in bringing a large ditch, for hydraulic mining on El Dorado Bar, from Duck Creek. This ditch will carry 2,000 in. of water, and will make sad havoc with the bar it is intended to wash. Great results are expected from this work. It will be completed by the 1st of July.

Truitt, Dahler & Co. have finished the Ten-Mile ditch, which carries 3,000 ft. of water. The flume across Grizzly Gulch, is a grand specimen of workmanship. The bents that support the flume, are hewn out of tall pine trees, and one put on top of another. The canal will be of incalculable benefit to Helena.

The C. P. Freeman lode in Jefferson county, a newly discovered ledge, is very rich. The crevice at the surface is 3½ ft. thick; and at the depth of 14 ft., is five ft. thick. A contract has been entered into to sink a shaft 50 ft. deep immediately.

Mr. Hanser has on the way five large furnaces, each of a capacity greater than the one at Argenta, and two quartz mills for crushing ores. Two of these furnaces have already been located. For the three remaining furnaces, and for the mills, no lotious have yet been made, but it is the design to purchase property or make arrange-

ments with quartz owners for working their lodes.

#### Black Rock. NEVADA.

The *Reveille*, June 20th, says that it is all folly to regard the ores of this district as intractable. There are amalgamators in Austin that will get the metal out, if there is any in the rock. The amount of ore is immenso, and could some method be devised to work it successfully, it would yield fortunes to hundreds of miners. Some of the ore has been sent to Freiberg for assay, no returns having been received as yet. Mr. Jno. A. Boalt, assayer, is now in the district making examinations, and will report the fruits of his investigations soon.

#### Humboldt.

Unionville *Register*, June 15th: Mr. Torrey has started up the Etna furnaces.

#### Pahrump.

Silver Bend *Reporter*, June 22d: The Pahrump Valley Co. are erecting a 10-stamp mill at Hiko, below Raymond's five-stamp mill. This latter was built on the soft alluvium of the valley and the stamps soon drove the battery blocks out of sight into the mud. Hereafter, the mills will be placed a few yards west where table land is composed of hard, gravelly concrete furnishes an enduring foundation. The machinery of the Crescent mill is nearly ready to run and will be in motion shortly. It has a battery of five stamps.

#### Reese River.

*Reveille*, June 17th: The amount of bullion produced and assayed at the Keystone mill during the week ending June 15th, was 15,510 ounces.

June 18th: A lot of crude bullion from the Rutland mill, melted at Currie's establishment, assayed .927 fine. This result shows that within 75 to 80 per cent. of the pulp can be turned out by this mill without roasting.

June 20th: Specimens of ore mined at Austin, on exhibition at the International Hotel, Virginia, have produced a sensation, from their hearty and rich character. The finest specimen was from the Diana, and would assay far into the thousands.

Gold Hill *News*, June 20th: Ex-Mayor Piper just from Pine Grove, reports good prospects.

The Belmont correspondent of the *Trepass*, June 11th, says: The mines are looking first rate—not only on the Highbridge, and in the immediate vicinity, but from all quarters. Rock of great richness is brought into town daily. Work is being pushed briskly on the El Dorado, Oneida, Independence and Arizona. Some very fine rock has been produced from the latter. From a conversation with McMurray, who is just in from Manhattan, I learn that everything is progressing finely in that district. Lack of mills is our only failing at present. The grading of the Combination Co's mill will be finished this week, and I understand the Silver Bend Mining Co. commence operations shortly on their mill. A new excitement, 60 miles from Indian Springs, has been sprung, and rumors of the discovery of fabulously rich rock are rife in town.

June 22d: The amount of bullion produced and assayed at the Keystone mill for the week ending June 22d, is 15,450 ozs.

*Enterprise*, June 19th: Our eastern districts continue to send in samples of extraordinary richness. The orders for machinery coming from a number of these new mining camps are excellent evidence of the worth of the mines, for the men engaged in their development are not men easily deceived in regard to the value of either gold or silver ores.

Silver Bend *Reporter*, June 22d: The Righty mill in San Antonio Dist., is crushing about 1½ tons of Liberty ore, daily, with four stamps, which yields an average of \$300 per ton. The ore is taken by the mill company at the mine and reduced at \$75 per ton. There is no scarcity of ore of this quality at the Liberty.

Two and a half miles east of the Montezuma Spring, is a large ledge called the Ruby, which crops holdly and can be followed without difficulty for a mile and a half. It is about 12 ft. in thickness, and is extremely rich—the predominating mineral being copper.

Col. Catherwood, of the New York and Silver Peak Co., is in Palmetto Dist., making arrangements to erect a mill.

Work upon the mill of the La Plata Co., at Park Cañon, Smoky Valley, is progressing rapidly. It is thought that the machinery will be ready for work some time during the month of July.

A ton of ore from the Jerusalem ledge, Empire Dist., recently worked at an Austin mill yielded \$467, pulp assay.

For the past six weeks the Murphy mill at Ophir Cañon has been run at only half its capacity, yet the average product of bullion has been about \$1,000 per day.

#### Washoe.

[In the Stock Circular, in another portion in this paper, will be found late mining news from this district.]

*Trepass*, June 11th: In the Yellow Jacket the connection between the winze and lower level has been perfected. The body of ore is larger than anticipated, and of a better quality than that above.

*Enterprise*, June 21st: The price of quicksilver has been reduced from 70 to 65 ets. per pound, at the agency of the Bank of California, in Virginia City.

New developments of rich ore has been struck in the Overman mine.

June 22d: During the past week, Wells, Fargo & Co. shipped 13,872 lbs. of bullion, valued at \$307,607.77.

Quite an excitement has prevailed during the last few days, about the superintendency of the Overman mine, McCulloch being removed, and Capt. Sam Curtis appointed in his stead.

Under date of June 12th, the Virginia correspondent of the *Bulletin* of this city, writes that the Gould & Curry mill will remain closed 30 days. There is a tremendous amount of repairing and cleaning up necessary, but this is not the sole cause of the stoppage. The supply of ore has been dropping off of late, until there was not enough to keep the entire 80 stamps in operation. The mill will be put in splendid order during the suspension, and 2,000 tons of ore will have accumulated.

#### OREGON.

Dalles *Mountaineer*, June 8th: About 250 miners are at work in the Big Bend mines on the upper Columbia river, and are making from \$5 to \$50 per day to the man, and the prospects are, from present indications, that some rich strikes will be made before the close of the summer.

Jacksonville *Sentinel*, June 22d: Stephen Gale found a diamond, while panning out a few days since. It has been examined in the dark, and pronounced a genuine brilliant.

Jacksonville *Press*, June 18th: The news from Wines Camp on Jump-Off-Jo, is in every respect gratifying. All the companies, thus far, who have cleaned up, have made good wages; notwithstanding the extra labor and embarrassments encountered in opening the claims. Mr. Wines and a partner, after a run of one day and a half, cleaned up \$80; their claim averages \$12 a day to the hand. Many of the other claims when placed in as good condition for working will, no doubt, pay fully as well.

*Record*, June 18th: A limestone quarry has been discovered by Frank Cooper, at the mouth of Beaver Creek, on Butte Creek, in Clackamas county, 18 miles from the Willamette river.

Cooper's coal mine is opening to good advantage, and at the depth of 65 ft. shows an improved quality of coal from that before produced. He has 100 tons of coal out, 25 of which he says is of the very best quality.

The *Oregonian* says: A recent discovery of coal has been made at the mouth of the Columbia, just back of Baker's Bay, and inside of the bar. It has been definitely settled that these coal mines are accessible, and therefore invaluable not only for domestic use, but for our great ocean steamers, which heretofore have been to extraordinary expense in procuring their supply of this article of fuel. Mr. Mercer has been appointed agent by the owners, who will, as soon as practical hands can be procured, proceed to open the mines, and render them of service.

#### DEPRECIATION IN THE VALUE OF COAL.

In an article, a few weeks since, we gave some particulars with regard to the depreciation in the value of coals from their exposure to atmospheric influences between the time of their being raised from the mine and their actual use by the consumer. In looking over a late report of the Peninsular and Oriental Steam Navigation Co., we notice the following paragraphs, which will be read with much interest in that connection:

"Unfortunately, the coals suffer greatly in transmission, and notwithstanding all the expenses incurred for their protection from the effects of climate, they undergo a deterioration of fully twenty per cent. from their original quality before they are burned. This fact was submitted to the committee of 1866 by a most competent witness, Mr. Samade, M. P., in the following words, when comparing European with Indian voyages: 'It is a well known thing that coal deteriorates very much indeed in hot climates. It is very difficult to keep it so useful and so good as in Europe, and I have made an allowance that we must require one-fourth more coal to do the same quantity of work.'"

#### Facts About Patent Matters.

##### NUMBER THREE.

##### WHAT MAY BE PATENTED, ETC.

In the first place, an abstract theory cannot be the subject of a patent; neither can any of the natural laws nor the forces of nature. It must be something that *man* has invented and reduced to practice, either by making a model or working machine, or at least have made drawings of it plainly showing the device and its mode of operation. It must be something not known or used by others before, either at home or abroad; or which at least, must not have been described in any foreign publication for a longer time than six months prior to its invention here. Many persons suppose that it is only necessary that the thing should be new at home; but this is not so, for the law is explicit on the subject; and at the Patent office, the examiners search the records of foreign patents, and the scientific publications of all nations, with which the library of the office is provided in all examinations, whenever there is any reason to suppose that anything has been done abroad in the same line, and applications are almost daily rejected on English, French, or German references. A patent may be granted for "any new and useful art, machine, manufacture, composition of matter," and for *designs* also—the latter being any figure or design attached to, stamped, or otherwise fastened upon some other article for the purpose of ornamenting it—such as figures in carpets, calicoes, oil-cloths, stove plates; also busts, hass-reliefs, etc. Improvements upon any article that could be the subject of a patent, may also be patented—no matter whether the thing improved has been patented or not. But if it be an improvement upon some other machine or device, instead of an entire new invention, then it must be so described and claimed in the application for a patent. In case of an improvement upon an article already patented, the inventor of the improvement cannot use the original article without the consent of the patentee, nor can the original patentee use the improvement without the consent of the inventor of the improvement. It is sometimes difficult to determine what is an improvement, but generally the action of the office is very liberal in determining this point. It must be something more than a mere modification of another thing. Some of the parts must be different from the same parts in other similar machines, or must be differently combined, constructed, or arranged. To constitute an improvement, it must produce new or better results, or produce them in a cheaper, simpler, or better manner. New results may be produced by the use of old and well known means, or old results may be produced by new means. The object sought to be accomplished cannot be patented, but the means for accomplishing it can be. For instance, a patent will not be granted for the admeasurement of time, but will be for the machinery or device by which it is measured. So, too, a patent will not be granted for the expansive operations of steam, but will be for the machinery or means by which its operations are carried on. A principle cannot be patented—only the means by which it is applied; and no matter how many different means of applying it may be invented, each is entitled to a patent. A person may, however, claim producing a particular result without limiting or confining himself to any particular mechanical device for accomplishing it, if he be the first who has ever done it, and shows at least one way of doing it. Such cases are, however, rare.

A combination of parts, or of the inventions of other parties, may also be patented. For instance, A invents and patents a cylinder for a steam engine; B does the same as to a valve, governor, or any other portion of the engine; C may then get a patent on the combination of A's and B's improvements in one machine, provided they operate together. In this case, his patent will cover only the combination, and will not give him any right to make or use either A's or B's invention, without first having the right of them; and so on of any number of parties. It is in this way—by this combination or aggregation of improvements in one machine that our most valuable machines have arrived at their present state of perfection. As samples of this, take the steam engine, the reaper, the threshing, and the sewing machine. In fact, it is often the case that the improvements are of as great or even greater value than the original invention. Howe's original patent on the sewing machine was of very little value, practically, until others invented improved machinery for operating it.

The same thing cannot be patented for one purpose, and then again for another. For instance, a fanning mill may not be patented for cleaning wheat, and then patented

again for cleaning beans. The mill itself is the subject of the patent, and it matters not to what use it is afterwards put.

Again: but one machine or device can be included in one patent, unless they are connected in their operation, and are used for one and the same purpose. For instance, a machine for sowing grain, and another for raking hay, cannot both be included in one patent, even though some parts of the same machine are used in both, because sowing grain and raking hay are two entirely distinct operations, requiring very different machines. So, too, a machine for cutting threads upon screws, and another for cutting the slots in the screw-head, cannot be included in one patent, although both are used to perfect the one article, because, if made separately, they are different machines, each performing its functions independent of the other. At the same time, a machine which includes devices for performing both these operations, could be covered by a single patent, if it constituted but one machine, and the parts were connected in their operation. This is illustrated by the nail machine, which both ends and heads the nail, by successive steps.

Thus it will be seen that almost everything that can be mentioned, or that can be used for any purpose whatever, may be patented.

Although the law uses the term "useful," a very slight degree of utility will suffice to ensure a patent. In fact, the courts have decided that the term useful is used in contradistinction to injurious; and hence that everything which is not positively injurious, is useful, in the sense meant by the law. In examining an application for a patent, the office does not undertake to decide whether the device is better than all preceding ones. The only questions are, is it new?—is it novel?—does it operate differently from others? If so, it is patentable. From this, it will be seen that there is no limit to the number of inventions yet to be made, and that those who talk about any branch of invention being exhausted, have but a limited idea of the subject. Every new invention that is made opens the way for countless others. Let a person attempt to determine by figures, the number of positions or changes that can be produced with the letters of the alphabet, and then consider that the alphabet of inventions is being constantly augmented by the addition of new cases, and he will begin to realize the impossibility of conceiving of the number of changes and combinations yet to be invented. It is infinite! I have sometimes thought that the best way to get an idea of what is yet to be done, is by endeavoring to realize what has already been done by man. In order to do that, let one simply imagine Adam, as at first created, *without a single manufactured article in the world!* Then take the first object upon which the eye rests—a pail for instance—and endeavor to think of the numberless processes, inventions and discoveries that had to be made, before that simple article could be produced. Think of the mines to be discovered—the ore mined and smelted—the forge to be built—the chemical process discovered and applied—besides the various other acts to be done before even the ax could be made that cut the tree from which the timber for the pail was obtained. Then let him follow in his imagination, that log to the mill—its transformation there into lumber—its conveyance perhaps thousands of miles—the varied and numerous processes through which it passes in the factory before it is ready to set up—then also of the hoops and bail, and the process and machinery necessary for their manufacture—let him do all this with reference to that simple article, a pail—and then let him endeavor to think of all the things there are made by the hand and skill of man in the world, and he will begin to have a very faint notion of what has been done in the way of invention and improvement. And when in addition to all this, he bears in mind the fact that every invention made, opens the way to countless others—that in fact, our progress in this line is constantly accelerating, he may then begin to realize the utter impossibility of imagining, much less limiting, the inventions or improvements of the future. Let no one, therefore, imagine that inventions are at an end—far from it. The discovery of coal oil alone has given rise to several thousand inventions. And then, too, consider for a moment, the numberless uses to which its products are applied—who can enumerate them?—and yet each day but adds to the number. In contemplating the future progress of our race in the department of invention, one becomes utterly lost. Even now, he is a smart man, who, in a lifetime, can even learn what has been already done! What, then, will be our condition a thousand years hence? and remember the Russian government has existed a thousand years already. Then at least,

"One science only, will one genius fit,  
So vast is art, so narrow human wit."

## Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

## Canvassing Agents.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.  
Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

Mr. S. D. Whitaker is our duly authorized traveling agent. June, 1867.

Mr. C. A. Wetmore is an authorized agent for this paper.  
Wm. A. Ferris is a duly authorized Traveling Agent of the Mining and Scientific Press. June 24th, 1867.

## San Francisco:

Saturday Morning, June 29, 1867.

## Notices to Correspondents.

H. C. M., Austin, Nevada.—Some information with regard to the advantages of the use of nitro-glycerine will be found in our last week's issue. The article used, as there referred to, is made in the following manner: Thirty-five pounds of a mixture of two parts of sulphuric acid and one part of nitric acid are placed in a stoneware jar—the jar being immersed in snow or ice-cold water; the acids so mixed are allowed to remain until they have fallen to 32° F. When this temperature has been reached, 3½ pounds of pure glycerine are poured into the jar, its contents being slowly stirred the while. This addition will raise the temperature from 32° to 60°; and if the stirring is not now stopped, the heat will still go on increasing to the danger of an explosion. After ten or fifteen minutes' rest, the temperature goes back to 32°, when 3½ pounds more of the glycerine may be added, in the same manner and with like care. Another ten or fifteen minutes' rest is now given, when a tub containing ice-cold water to about seven times the quantity of acid and glycerine, is prepared, and the water placed in a rapid whirl by means of a broad stick or paddle. When this motion has been well established, the compound is slowly poured from the jar around the edge of the whirling water. The glycerine, being insoluble and heavier than water, soon collects at the bottom of the tub, while the acids, with the water and the excess over that which passes into chemical combination with the glycerine, is poured out—the glycerine is thus washed clean of the acids with which it has been mingled. The chemical action which has now taken place is a separation, from the glycerine, of three equivalents of hydrogen, which are replaced by a like number of equivalents of nitric acid. The manufacture is now complete, and the article is placed in cartridges of proper size and prepared with any suitable percussive apparatus for firing the same. The preparation must be kept constantly at a very low temperature. The practice on the railroad is to place the cartridges, as fast as made, upon the snow or ice, where they soon freeze. Nitro-glycerine freezes eight degrees above the freezing point of water, or 40° F. They can be used as readily when frozen as when fluid. It is possible that some portion of the above detail may not be strictly correct. Of course no one who is not a thorough practical chemist should attempt to experiment with this dangerous compound until they have witnessed its manipulation and manufacture by an expert. We presume that the gentlemen having charge of its manufacture at the railroad tunnel would give our correspondent all necessary instructions for its manufacture, and that all desired preliminary information could be obtained by addressing a letter to Mr. Stanton, the Superintendent of that work. A detailed and illustrated account of the mode of using nitro-glycerine will be found in our issue of December 23, 1865.

POTTER, ANTIOCH.—Unless the difficulty arises from the dearth of fuel, we think ordinary varieties of porcelain might economically be made in this State. Salvatet and Ebelman found that in the manufacture, the chief Chinese varieties corresponded with the chief principal European kinds, so far as the raw materials employed are concerned.

## Interesting Chemical Researches.

We alluded, some three or four months since, to the fact that the distinguished French chemists, Daubrée and Bertholet, have been for some time engaged in an interesting series of chemical experiments and investigations, the object of which is to show that the combinations of carbon and hydrogen, known to chemists as hydro-carbons, may be effected without the intervention of either animal or vegetable life—that is, in a purely mineral way. In the course of these experiments, the gentlemen named actually succeeded in producing acetylene ( $C^4H^2$ ) by the direct union of carbon and hydrogen derived from purely mineral substances; and furthermore showed that this radical (acetylene), heated to a temperature near that at which glass melts, and under certain conditions, is gradually converted into a series of polymeric bodies identical with certain well known hydro-carbons. Thus, triacetylene is benzol ( $C^{12}H^6$ ); tetracetylene is styrol ( $C^{16}H^4$ ); pentacetylene is cymol ( $C^{20}H^{10}$ ). The highest product yet obtained in this series is retene ( $C^{16}H^{18}$ ).

Upon the result of their experiments, Bertholet has put forth the hypothesis that carbonic acid, everywhere infiltrated into the crust of the earth, may, on coming in contact with the alkali metals, form acetylides; or that these radicals may result from the contact of earthy carbonates with alkali metals, at or below a dull red heat.

These radicals once formed, and subjected to the action of heat, water, etc., admit of an almost infinite variety of reactions, by which all the natural hydro-carbons may possibly be produced.

By the mail which arrived on Tuesday last, we are further informed that, in the continuation of these researches, M. Bertholet has succeeded in still further building up this organic structure, so wonderfully begun, by the addition of  $O^3$  to his  $C^4H^2$ , which constitutes the exact formula of *oxalic acid* ( $C^4H^2O^3$ ), and that the substance so produced is actually the commercial article known by that name!

Other carbides of hydrogen have also been oxidized with the same success, giving a great variety of appropriate products; and we may here mention, that the first of these singular facts was demonstrated by the formation of alcohol by the direct union of carbon and hydrogen, which was performed by Bertholet alone.

His experiments with the hydro-carbons have led him to conclude that the process of the distillation of coal actually produces a portion of the substances derived therefrom by a chemical union of the carbon and hydrogen in the presence of heat and steam.

His latest success has been the formation of toluol, the base of the new and rich toluen red ( $C^{14}H^3$ ). The composition of this substance indicates the addition of marsh gas ( $C^2H^4$ ) to benzene ( $C^{12}H^6$ ), with the loss of two equivalents of hydrogen. M. Bertholet is still pursuing his wonderful line of investigation and achievement, in which he has opened a most unexpected door to the chemical creation of the products of organic life!

BANANA PLANT.—An effort is being made to introduce the culture of the banana into California. Several of these plants brought here from the Sandwich Islands a few years since, are now growing finely, and it is believed that in the warmer parts of California say in Los Angeles, Santa Clara, Yuba and Solano counties, the plant can be grown to advantage with slight trouble, especially in sheltered localities. It is claimed that the banana will produce more food to the acre than any other known plant. A large number of plants were brought up by a late Panama steamer, with the view of still further testing the possibility of their culture in this State. The tree is ornamental as well as useful.

## The California Flour Trade.

The present week closes the harvest year of 1866, and during the year not less than 290,000 tons of wheat have been received at this port from the interior! Of this amount 250,000 tons have been shipped abroad. The first sale of the crop was made at \$1.60 per 100 pounds; the highest figure reached was \$2.25, at which but little changed hands; the lowest quotation has been \$1.45, at which figure a considerable quantity was sold. The average for the year has not been far from \$1.76—equal to a grand total, if it had all left the State as wheat, of \$8,800,000. The average price of flour shipped has been about \$6.25.

The total receipts for wheat and flour shipped from this port the past year, will very nearly reach the round sum of *ten millions of dollars!* This, it should be recollected, implies the production of that amount in excess of our own consumption, and all that has been sent over the mountains for the supply of the State of Nevada and the neighboring territories. It is a large amount to form a single item of our agricultural productions, and is an earnest foretaste of what may be expected in the future, when the capacities of our State shall be tested to their utmost extent. As yet but a mere tithe of the wheat lands of California have been improved; present appearances indicate that the coming year will be equally as productive as the past.

The reputation of California wheat and flour in the Eastern States and Europe, is second to that of no other country. The profits of shippers during the past year have in some cases, been very large. The ship David Crockett's cargo to Philadelphia, paid its owners over \$60,000 clear profit. At one time when wheat was selling in New York for \$5.66 per 100 pounds, it could be bought in this city for \$2.50 currency, or \$1.90 gold—2½ cents per pound here against nearly six cents in New York! The profit on such shipments can be easily perceived, when it is stated that the freight in sailing vessels averages but a small fraction over one cent per pound.

The Panama steamers, alone, have carried to New York during the past year, about 130,000 barrels of flour. Five ships were loading in this port at one time in April. Wool, hides, and other products pressing for shipments, have had to give place to wheat and flour, on account of the high freight which those articles were able to bear. The future of the wheat trade of this city baffles all calculation. We have an open market in almost every part of the world. The Atlantic States, England, Ireland, France, Japan, China and the islands of the Pacific, are all within our reach, and can all be supplied at a fair profit by California shippers. The rewards which have attended the labors of the husbandmen of our State for the past year, have demonstrated the great advantages which may be desired for a more extended cultivation of the soil, and have shown that there are other golden crops to be realized than those dug out of our gravel placers or rocky mountain sides.

F. AMELIA COOK, M.D., a regular graduate of a medical institution in Philadelphia, has opened an office for the practice of medicine at No. 33 Kearny street. We believe that Miss Cook, who is respectfully connected in this city, is the first regular female graduate who has located here. There are now quite a large number of such persons practicing medicine at the East, with much credit to themselves and satisfaction to the public. These regular graduates should never be confounded with the great numbers of pretended clairvoyants and others, who are mere quacks, and who are very properly debarred from any regular standing, either in the community or in medical societies.

DR. BOYNTON'S MEDICINE CHEST can be examined at this office. To families, miners and ranchmen, it is invaluable.

## The Railroad Across the Continent.

The work on the eastern division of the Central Pacific Railroad is being pushed forward with wonderful rapidity and energy. The process of track laying is said to be proceeding at the rate of nearly two miles a day. This part of the work, although it appears to be systematized to the utmost extent, is undoubtedly conducted at a considerable sacrifice of economy, to speed.

The cars that bring up materials to the front are loaded with great care, each carrying a certain number of rails, and the exact number of chairs and spikes required to lay them. These are sent out to the work, and the "boarding cars" in which the workmen live, having been pushed as far as possible toward the end of the track, the materials are thrown on behind them, then the boarding cars shoved back, and the small cars used in laying the rails come up to the piles of new material. The process of laying the track is thus described by an eye-witness:

"A small car having been loaded in the same manner, and with the same precision as the large ones had been, was run forward to the end of the track by horse power. A couple of feet from the end of the rails already down, chocks were placed under the wheels, stopping the car at once. Before it had well stopped a dozen men grasped a rail on each side, ran it beyond the car, laid it down in its chairs, gauged it, and ere its clang in falling had ceased to reverberate, the car was run over it and another pair of rails drawn out. This process was continued as rapidly as a man would walk. Behind the car followed a man dropping spikes, another setting the ties well under the ends of the rails, and thirty or forty others driving in the spikes and stamping the earth under the ties. The moment that one car was emptied of iron, a number of men seized it and threw it off the track into the ditch, and the second followed on with its load."

The writer of the above has evidently drawn considerably on his imagination with regard to the rapidity of the progress of the work; although the particulars of the manipulation may be correct in the main. Laying rails "as rapidly as a man would walk," would imply at least ten or twelve miles a day—less than two miles is probably the fastest time yet made, although the telegraph lately claimed *three*. No doubt the work is being pushed forward with the most astonishing rapidity.

On the first of January last, the rails were laid 305 miles west of Omaha, and fully equipped with everything for the most economical work, both for freighting and passenger carrying. By the first of September next, the contractors expect to have the road completed to the base of the Rocky Mountains, 517 miles this side of Omaha (formerly Council Bluffs, on the Mississippi river). If this is accomplished, it will be at the average rate of nearly one mile a day, from January 1st to September 1st, of the present year.

As the contractors on this end of the route are prosecuting the work with the same degree of energy, it is confidently expected that the scream of the locomotive from New York, will be heard on the western flank of the Rocky Mountains, answering to that from San Francisco, by the end of the present decade, or within two years and a half from date!

THE UNIVERSAL EXPOSITION.—A very interesting letter, from a well known citizen of San Francisco, descriptive of the Paris Exposition, will be found on another page. It appears to fully justify the charge of mismanagement on the part of those who have charge of the American Department. Californians appear to be especially in the back ground. Such a condition of things ought not to have been allowed.

HUNTER'S AMALGAMATORS.—Mr. Hunter is constructing four of his largest size rubbing amalgamators, to the order of Prof. Silliman, for a 20-stamp mill now being erected on the Quail Hill Co's ground, near Telegraph City, in Calaveras county. The rubbing surface of each of these machines will be about four feet eight inches wide by six feet in length, and will contain about sixty square feet of copper plates.

OUR SEMI-ANNUAL INDEX.—We would call especial attention to the full and copious index of the present volume, which we give to-day. Therein will be found reference to all the new inventions on this coast during the past six months; all patents issued during that time to inventors in the States and Territories of the Pacific coast; all the most important themes discussed at the California Academy of Natural Sciences; all new discoveries in science, and all important improvements in the mechanic arts (as given from week to week under our respective heads of scientific and mechanical miscellany); all matters noted in our "Notices to Correspondents," a great variety of general and miscellaneous matters discussed editorially, by correspondents, or in selected articles; new incorporations, and elections of mining officers in this city, etc., etc.

PARIS EXPOSITION.—AWARDS, ETC.—The telegraph reports 524 United States exhibitors at Paris. There have been awards in favor of 262, including four grand prizes and 17 gold, 62 silver, and 103 bronzo medals. Seventy-nine American exhibitors are honorably mentioned. It has already been announced that the United States has been awarded the first prize for locomotives and piano-fortes.

At a meeting of the Paris Exposition Committee of this city, held on Tuesday last, the Finance Committee reported that \$1,145 had been collected through subscriptions; that \$139.50 had been paid for boxes, packing and incidental expenses, leaving a balance on hand of \$1,005.50. The Secretary was directed to forward \$500 to Munroe & Co., Paris, as suggested by Professor Blake, and hold the balance subject to Professor Blake's order, after paying any demands that may be presented.

### Cholera---Perry Davis' Vegetable Pain Killer.

MR. PERRY DAVIS, Sir:—The benefits I have received from the use of your invaluable remedy, the Pain Killer, induces me to pen a word in its praise. Experience has convinced me that for Headache, Indigestion, Pain in the Stomach, or any part of the system, severe Chills, Weariness, common Colds, Hoarseness, Cholera, Cholera Morbus, Diarrhoea, Dysentery, Toothache, etc., there is nothing better than the Pain Killer. I have this hour recovered from a severe attack of the Sick Headache, by using two teaspoonfuls, taken at thirty minutes interval, in a wine glass full of hot water. I am confident that through the blessing of God, it saved me from the cholera during the summer of 1843. Travelling amid dust, toil, change of diet, and constant exposure to an infected atmosphere, my system was daily predisposed to dysentery attacks, accompanied with pain, for which the Pain Killer was a sovereign remedy. One teaspoonful cured the worst case in an hour, or, at most, half a day! I have heard of many cases of dysentery being cured by its use. Put in the teeth, it will stop the toothache. Gratitude, and a desire for its general use, has drawn from me this unsolicited testimonial in its favor.

D. T. TAYLOR, Jr., Minister of the Gospel.  
Sold by all Medicine Dealers every where. 22v14 in

## BLAKE'S PATENT QUARTZ CRUSHER.

### CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a release of the Patent, bearing date January 9th, 1856.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,  
Agents for the Pacific Coast.

## Crawford's Stump and Rock Extractor and Elevator.

STUMP AND SNAG PULLER.

PRICE OF MACHINES.—No. 1, 10 tons, \$200; No. 2, 15 tons, \$275; No. 3, 20 tons, \$350. Small Model Machines—weight 30 pounds—lift 1 1/2 to 2 tons, \$75; other sizes to order.

These Machines are adapted to all kinds of work, and where labor is scarce they are invaluable. Two men can work the machine. A few of their uses are: Loading boilers, granite, heavy ordnance in casemates, or any heavy body. For mountain teamsters they are of great value. Lifting wagons, etc., clearing lands of stumps, moving boulders for railroads, or for railway companies. There is scarcely any work of moving heavy bodies which they are not adapted to. Single Machines, or Right of City or County, and all information can be obtained by letter, or otherwise, by application to  
San Francisco, April 17, 1867. [16v14cow1m]

GRUB AND ROCK EXTRACTOR.

## TO MINERS, MILLWRIGHTS AND FARMERS.

We beg leave to call your especial attention to the

### EXCELSIOR

#### Double-Acting Suction and Force Pump.

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

By simply loosening the nut seen at the base of the Air-Chamber, the discharge nozzle may be turned, thus making a right or left-hand Pump.

Fig. 4.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or

## A. S. Hallidie & Co., MANUFACTURERS OF FLAT & ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer. Interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies in erecting Hoisting Ropes, should be sure and have their drums and pulleys of sufficient size whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord—1/2 to 1/4 inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to many factors. 26v13Gm9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Plate, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Oaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

**Old Boilers Repaired  
D. CAMERON.**

6v12-1y

**A FOUNTAIN TREE.**—A healthy poplar, seven or eight years old, is taken from its native soil, and a cold iron borer is run up the heart of the trunk, from the roots, for six feet, by which means the pith is removed and the trunk is made to assume the character of a pipe. A hole is then bored through from the outside of the trunk, to communicate with the highest point reached by the former operation, and in this second hole, a short distance above the root, in a part of the trunk which will be buried in the earth when the tree is replanted, and the poplar is then fixed in damp ground, with the pipe at its root in connection with one of the little runs of water which abound in meadows at the foot of hills. A well known property of fluids produces then the strange effect of an unceasing flow of water from an iron spout in the trunk of a living tree: and as poplars love water, the fountain-tree thrives, and is more vigorous than its neighbors.

**FIRE CLAY NEAR CENTRAL CITY, COLORADO.**—Mr. Burlingame, says the Colorado Miner, assayer and analytical chemist, recently made a test of some of the fire clay lately discovered near Central City. It stands the heat well, and the new discovery will prove quite an acquisition to the Territory in the way of supplying the mountain furnaces.

THE death of one person from the pork disease, in Springfield, has caused the people there to abandon pork pretty generally. An exchange says that a dozen deaths from rum wouldn't frighten them half so much, nor damage the trade in the least.

IT IS SAID that fourteen thousand four hundred and twenty-three tons of stone were thrown out by a single blast, with three kegs of powder, at a quarry in Middletown, Conn., on the 7th instant—the largest blast ever made there.

**CHALK.**—Five or six miles from town, says the Alpine Miner, in a northerly direction, is a large ledge of what our carpenters pronounce a superior article of chalk—white chalk.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**A SHOWER OF MOLTEN IRON.**—The Louisville Courier of May 23d, described an explosion which took place at Long's foundry in Louisville, the day previous. It appears that the explosion was caused by pouring molten iron into a mold, into which rain had dripped. About a ton of iron was sent through the building, the chief portion being hurled directly upward through the roof. The shock was so heavy as to break the glass more or less for two entire blocks. The man holding the ladle was thrown out of a window—seriously burned, but not killed. No other person was seriously injured.

**B. F. HOWLAND,

## Important Notice.

## Another New Doctor in the Field!

DR. H. A. BENTON,

Has been performing many wonderful cures in this city the past two years, and, as his practice is fast increasing at the office, he finds it difficult to attend all the outside calls, and has concluded to invite R. H. OLMSTEAD, M.D., to join him. Dr. Olmstead, of Napa City, has been eighteen years successfully treating obstinate cases with water, electricity, and the magnetic forces. Remedies of the Eclectic School, of which he is a graduate, can be resorted to when needed. Being the seventh son of a celebrated physician, and at the same time having a powerful organization, his magnetic hands like magic dispel pain and disease. He is also a natural bone-setter. Dr. Olmstead has this day associated with Dr. H. A. Benton, the Medical Electrician and Homeopathist, at his office, 314 Bush street, San Francisco, who, having all the necessary facilities, such as the patent Electric, Chemical, Sulphur, Vapor, Hot Air and Medicated Baths, which aid in curing all curable diseases, whether acute or chronic, and with the combined skill, together with an excellent lady assistant, gives an assurance of cure to many, benefit to all, and injury to none.

N. B.—Terms for treatment within reach of all. Office hours: from 9 A. M. to 8 P. M.; Sundays, by appointment. Lodging rooms convenient for those who come from the country.  
June 1st, 1867. 22v14-cow4t

PACIFIC CHEMICAL WORKS.

FALKENAU & HANKS HAVE REMOVED THEIR OFFICE to 623 Montgomery street, opposite Montgomery Block, where they will receive orders for Chemicals of all descriptions, and for Assays and Analyses of Ores, Minerals, Metallurgical Products, Mineral Waters, Commercial Articles, etc. Laboratory, corner of Center and Folsom streets, Mission. 24v14-4v

EUROPEAN  
METALLURGICAL WORKS,  
—AND—  
Practical Mining School,

Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process at the works. Sulphuric, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, raining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.  
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.  
S. F. KIMBALL, J. R. MURPHY.  
10v10

J. A. BAUER,  
Chemical Laboratory,  
AND DRUG STORE,  
644 Washington Street. [Established 1849.]  
SAN FRANCISCO.

Careful Analyses made of  
Ores, Minerals, Waters, Oils, Liquors,  
Wines, Products of Art, etc.

Pharmaceutical Preparations Made to Order.  
Opinions given on Chemical Questions and Geology.  
Particular attention paid to Analyses of all kinds, in cases where legal questions are involved.  
Pure Nitric Acid, Nitrate of Silver, Cold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale. 12v14-6m

## FAIRBANK'S PATENT

PLATFORM SCALES!  
Also, large Scales for weighing loaded wagons of Ore, Hay, etc., from 6,000 to 40,000 pounds capacity. Manufacturers' Branch House.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and so the circumference as before. Thence it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
**PACIFIC FOUNDRY,**  
171  
San Francisco.

## FOR SALE!

**PATENT RIGHT OF  
HUNT'S WINDMILL** for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

**E. O. HUNT,**  
225 SECOND STREET,  
11v24  
San Francisco.

## To Quartz Miners and Others.

### NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the **HITCHENS' ORE PULVERIZER.**

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

1v14-3m JAMES HITCHENS.

## NELSON & DOBLE,

AGENTS FOR

**Thomas Firth & Sons' Cast Steel, Files,**  
Etc., Shear, Spring, German, Flow, Blister and Toe Calk Steel, manufacturers of

## SAN FRANCISCO BRUSH FACTORY,

No. 211 California st., manufactures to order all kinds of **BRUSHES.**

At lower prices than cost of Eastern Importation. Brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root fiber; also, Silica Brushes from the same material. The Patent Rattan, Street Stable, Fine and Flame Brush, for which they have the exclusive right for the Pacific Coast.

All orders from the Interior promptly executed.  
**FELDMAN, SIMPSON & CO.,**  
16v14q. Proprietors.

## Brodie's Patented Improvements

## FOR THE TREATMENT OF Gold and Silver Ores.

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.** The attention of all interested in Mining is respectfully called to this improved machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages the advertisers are enabled to offer these machines to the public at the following low terms:  
No. 1—Or 6-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$400  
No. 2—Or 10-inch Crusher, capable of similarly putting through five to six tons per hour.....\$500  
No. 3—Or 16-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.** The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable jaw, B, which is bolted to the frame, and is regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Raywilde Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Raywilde Ranch" Mine, in Tuolumne county:

"Raywilde Ranch, Tuolumne Co., Sept. 23, 1886.  
JAMES BRODIE, Esq., San Francisco: Dear Sir: I give me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Raywilde Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
Supt. Raywilde Ranch Quartz Mill."

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1886, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A drawing, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1886.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22nd, 1886.

**BRODIE & RADCLIFFE,**  
Express Building, 402 Montgomery street,  
12v13H San Francisco.

## Hooker's Patent Pump Valve.

A, A, A, are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the india rubber facing, which is secured to the bottom of the Valve by a washer and screw, the end of which is seen at C.

The advantages claimed for this Valve, are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water.

Rights for the use or manufacture of this Valve, for sale by

**V. CUSHING,**  
120 Front street, San Francisco  
These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

See illustration and description of this Pump, published every other week in this paper. 18v14qH

## LEFFEL'S American Double Turbine

**THESE WHEELS, UNEQUALED AND UNRIVALED** in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

**CALIFORNIA REFERENCES.**—E. Stoecken, Polson; O. Simons, Oakland (Mill at Clear Lake); Morgan Coville, Lexington; Santa Clara County, J. Y. McMillan, Lexington; Santa Clara County. Send for Circular.

## Hunt's Globe Pump

Is extensively employed for raising water by hand or wind-mill power, for house or garden uses. Manufacture five sizes, from 3 to 8 inches diameter in the chamber. These Pumps are all fitted for iron or lead pipes. They are very durable and easy to repair.

No. 3—3-inch Chamber, 6-inch Stroke.

No. 4—4-inch Chamber, 6-inch Stroke.

No. 5—5-inch Chamber, 6-inch Stroke.

No. 6—6-inch Chamber, 8-inch Stroke.

No. 7—7-inch Chamber, 10-inch Stroke.

Manufactured at No. 28 Second street, and 110 Jessie street, San Francisco, by E. O. HUNT, Windmill Builder.  
22v14H

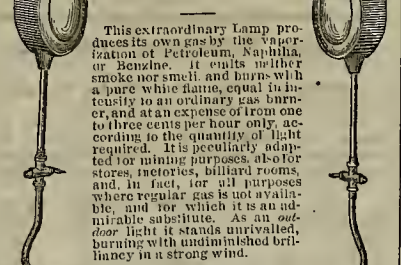

## HEALTH! HEALTH!

To prevent this, purchase one of  
**Taylor's Stench Traps and Garbage Baskets,**

And promote the health, comfort and cleanliness of your family. For description see Mining and Scientific Press, April 6, 1887. Sole agents and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 16v14H

## THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, interiors, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

**Directions for Use.**  
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State.  
18v14-3m

THE WYSAW, Missouri, *Times* publishes the following recipes, that may be worth remembering: "The oil of pennyroyal will keep mosquitoes out of a room, if scattered about even in small quantities. The inner bark of white ash will, if brought in contact with a snake, stiffen him like a stick in an instant; and a bite of fresh tobacco, placed on his tongue, will kill him dead as if struck by lightning, while sheep and goats feed on it, pressed, with impunity. Roaches are exterminated by scattering a handful of fresh cucumber parings about the house. No fly will light on the window which has been washed with water in which a little garlic has been boiled."

**THE SNOW PLANT.**—That wonderful production of our Alpine heights, the snow plant, says the *Alpine Miner*, may now be found, we are told, in large quantities. We have never been fortunate enough to see one in its growing state, and therefore will not attempt a description; but from hearsay we are led to believe this plant is one of the rarest of nature's productions.

A CHIME of forty-two bells, to be placed in the Exposition, is played like a pianoforte with perfect ease, to any tune. Four years were spent in the construction of the instrument.

**BLACK RIVER, Wisconsin,** is completely jammed with logs for fifteen miles. It is estimated that there were not less than 225,000,000 feet in the river at the opening of spring.

Practical Mining Engineer.

## Notice to Miners, Well-Borers and Water Companies.

**M. PRAG** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pumps in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.  
18v13-1y Stove Store, No. 125 Clay street, below Davis.

## \$85 for Hunter's

## Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on the Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$100 extra. The Machine can be

**Seen in Operation**  
At Booth & Co's Iron Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

## FOR \$50.

**HUNTER'S EUREKA AMALGAMATOR.** For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer for wood.

By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address  
**ANDREW HUNTER,**  
Union Foundry, San Francisco.
